Another point which has occurred to me is that, conceiving that we could put bigger boilers upon our locomotives, bigger drivers and cylinders, until we finally could secure the horsepower necessary to handle the high speed or large loads, one difficulty which I have recently noted about an engine of that kind is that it cannot start. It may run at full speed when it is in motion all right, but even with the drivers we have to-day and with the boilers, etc., it is impossible for the Empire State express to start itself at Albany, and it is necessary that a freight locomotive, a slow speed locomotive with eight or ten drivers should come along at the other end of the train and push it before it can start. No such difficulty as that pertains to the Heilmann locomotive or any similar locomotive, because there is an unlimited torque for starting. and I point out that the two limitations in present practice for locomotives are, it seems to me, that we want to go faster; that is one point, and as to that, we have every advantage in connection with the electric locomotive; and the other point is, we want to pull more freight cars up a grade, and we can do that better with an electric locomotive than to my mind we can ever hope to do with a steam locomotive.

Mr. Lloyd [*communicated after adjournment*]—Referring to Mr. Leonard's reply to the foregoing criticisms (to which I had no opportunity of replying at the time), I can only say that if Mr. Leonard denies that a first-class generating plant costs $100 per horse-power he is mistaken. The remainder of his reply is simply facetious, and not logical or consistent. The experience of engineers in this country with batteries ten years ago has no bearing on the results obtained to-day. Apropos of this, if my information is correct, the express object of Mr. Leonard's visit to Europe was to investigate steam turbines, of which he speaks so glowingly, with the idea of adopting them for driving the generators used in the welding of street rails. Immediately on Mr. Leonard's return he contracted for the use of three complete battery installations to do this work instead of the steam turbines.

---

*H. Ward Leonard's paper read at a meeting of the A. I. E. E., February 27.

To Correct Patent Abuses.

New Rules Go Into Effect.

New Patent-Office rules went into effect on April 15, preventing an applicant for a patent from holding it in abeyance and shutting out other patents by appealing repeatedly and making slight changes in his specifications. In the Berliner case, recently declared illegal, the patent was in the office fifteen years, and was granted to the inventor for seventeen years more.

The new rules require applications and appeals to be made within six months, and direct the rejection of any claims that have been pending for five years.

There can be no criticism of the above regulations from bona fide inventors with honest intentions as to the use of their patent privileges.

As often stated in Electricity, the American patent system is the best system in the world. Its fundamental plan, however, presupposed its use by men of at least ordinary honesty, and too little protection was afforded against the sharks, the speculators and the schemers, whose consciences have not deterred them from taking dishonorable advantage of provisions which were made in a spirit of justice and beneficence.

BOOK REVIEW.

A Text Book on Electro-Magnetism and the Construction of Dynamos. Vol. I. By Dugald C. Jackson, B. S., C. E. 8vo, cloth. Pp. 289. New York and London: Macmillan & Co.

This little book, as its title implies, is intended for a text book on the subject treated, which, as stated in the preface, is limited to the fundamental principles and their application to direct current machinery of the constant potential class.

Prof. Jackson's treatment of his subject is clear and concise, as it should be, and his methods are direct. It involves the use of the calculus, however, which has its advantages and its disadvantages. For students who have progressed that far in mathematics the methods of the calculus are by far the best, but for those who do not use these methods readily they become at once obstacles which they do not attempt to surmount. A still further limitation to the usefulness of the book is imposed by the author's apparent assumption that the student has the facilities of a well equipped laboratory at hand as well as the assistance of a teacher as able and competent as himself. Unfortunately it is unfair to assume either of these conditions, but granting them, the book will doubtless fulfil its mission in an admirable manner.

The first chapter of twenty pages is devoted to "Primary Definitions and Evaluations." So far as we have observed, the author has taken the utmost pains here to be both clear and correct. Chapter II, of fifteen pages, discusses simple electro-magnets. So far as the author goes into the subject this is good, but he leaves too much for the instructor to fill in. Much of what might have been expected in Chapter II is found in Chapter III under the title "The Magnetic Properties of Iron," but the want is not sufficiently supplied here to affect our criticism. The remainder of the book is devoted to a somewhat mathematical treatment of the elements of dynamo electric machinery, including—IV, The Establishment of Electric Pressures; V, The Magnetic Circuit of the Dynamo; VI, Compensation for Cross-turns and the Effect of Brush Contact; VII, Characteristic Curves and Regulation; VIII, Efficiencies, and IX, Multipolar Dynamos.

The book is well printed in fair type on heavy tinted paper, and the illustrations, which are outline drawings and diagrams, are good.

The Crocker Lectures.

"The Electric Motor and Its Application to the Transmission of Power," was the subject of the fourth in the series of lectures Prof. Francis B. Crocker is delivering on Thursday evenings at Columbia College. Considerable attention was given to the history and development of the motor from the time of Barlow's wheel until the present day. The convertibility of the dynamo into a motor and the converse operation of transforming a motor into a dynamo was shown by a series of interesting experiments. In enumerating the manifold applications of the electric motor and the decided and many advantages of utilizing and applying power, Prof. Crocker said that the tendency is to use electric motors for all power purposes. He could not admit that the alternating current motor, as recently developed, would supplant the direct current motor, except in so far as applies to long-distance transmission.

Highly interesting experiments were made showing very plainly the relation of counter to direct electromotive force in the regulation of motors; others showing how the work done by a motor can be measured.

The next lecture in this course will be on "The Electric Railway," and will be delivered by Prof. George F. Lieber of Columbia College.

LEGAL NOTES.

At Cleveland, O., recently the Akron, Bedford and Cleveland Electric Railway Company began suit to appropriate a right of way along the New Bedford road in Newburg hamlet, and the hamlet trustees resisted the application. The company claimed the same right to take the necessary land that a steam railroad enjoys and leave the damages to be assessed by a jury. The trustees claimed that the line was a street railroad and that the company must gain their consent before opening the line. Judge White found no difference between a railroad operated by electricity and one operated by steam, and decided that the appropriation proceedings are proper.

An order has been signed by Judge Wickes, at Baltimore, Md., directing the receivers for the Ries Electric Specialty Company to call upon the stockholders of the company for the unpaid instalments of the capital stock issued to them. These payments are necessary in order to pay the indebtedness of the company.

Personal.

Messrs. C. S. Knight and J. J. Woods, of the Ft. Wayne Electric Corporation, were New York visitors last week.

Mr. C. H. McIntyre, of Newark, N. J., has returned from a Southern pleasure trip.

William H. McKinlock, president of the Metropolitan Electric Company, Chicago, was called East last Monday morning on business. He was accompanied by his family. Mrs. McKinlock, son and daughter left New York Wednesday, April 10, on steamship La Touraine for Paris, to be absent one year.

A Large Portable Plant.

At Ambrose Park on Wednesday a successful test was made of two portable electric arc lighting plants made for Buffalo Bill's Wild West Show by Ridsdale & Lewis, of 39 Cortlandt street, New York. Each equipment consists of a Case engine coupled direct to a Ball 30-light arc machine. Steam is supplied from a Clapp boiler, the whole plant being compactly built on a heavy wagon truck. The entire plant of 60 lamps can be erected and put in operation in about two hours.

The contract for building the big power house at Birmingham, Ala., has been awarded to Thomas Purvis. The plans were drawn by Stone & Webster, of Boston.

General News.

What is Going on in the Electrical World.

Taylor, Tex.—The Taylor electric plant has been purchased by B. Gary for $10,975.

Canfield, O.—The people here have voted in favor of bonding the town for an electric street railway.

Elgin, Ill.—Right of way for an underground trolley road has been secured between Elgin and Geneva.

Bismarck, N. D.—The city council has repealed the electric light ordinance granting a franchise to Edmond A. Hughes.

Grantsburg, Wis.—St. Paul parties have purchased land and water power here and will erect an electric light and water plant the coming season.

Sandford, Fla.—J. M. Saunders has been granted a franchise to construct and maintain a plant for electric lighting and for a street railway in this place.

Helena, Mont.—A school house, planing mill and a waterworks and electric system are to be built at the Crow Agency this summer at an expense of $40,000.

Milwaukee, Wis.—The city engineer is preparing plans and estimates for a municipal lighting plant for this city. The Badger Illuminating Company's contract expires next fall.

Mauch Chunk, Pa.—The new power station of the Mauch Chunk Electric Light, Power and Heat Company has just been completed at a cost of $25,000. It is operated by water power.

Rome, N. Y.—The Rome City Street Railway Company has received permission from the city council to change the motive power of its road from horses to electricity or other power except steam.

Morristown, Tenn.—The commissioners have under consideration a plan to utilize the water power attainable here for the production of electricity for lighting the town and for other purposes.

Auburn, N. Y.—F. W. Dana, H. W. True and N. Q. Pope are the prime movers in a company formed to build an electric railway from East Auburn to Turner. The capital stock of the company is $50,000.

Appleton, Wis.—The city council has declared the Tillotson interurban electric franchise void. This action will prove a severe blow to the plans of the interurban line from Oshkosh to Kaukauna, as Appleton is the main point on the proposed route.

Pensacola, Fla.—B. R. Pitt, president, and J. S. Leonard, secretary and treasurer, of the Pensacola Electric Light and Power Company, having resigned, their places have been filled by Benjamin F. Peach, Jr., and W. S. Garfield, both of Boston.

Lynchburg, Va.—The city council has finally determined the much-agitated question of lighting the city by awarding the contract to the Lynchburg and Rivermont Electric Company, thus defeating the proposition for the establishment of a city plant.

Ottawa, Ill.—The Ottawa Electric Street Railway Company, controlled by the General Electric Company, has stopped running its cars. President Evans says if the Ottawa business men do not purchase the road at once he will pull up the tracks and take it elsewhere.

Bristol, Conn.—The Bristol Electric Light Company and the Bristol and Plainville Tramway Company are to be consolidated. The light company has a well equipped plant and will have to add but little to its present equipment to furnish motive power for the tramway.

El Dorado Springs, Mo.—A franchise has been granted to W. B. Lewis by the board of aldermen to erect an electric light plant in this city, the franchise lasting 21 years. The ordinance granting the franchise provides that the plant shall be in operation within two years.

Pottsville, Pa.—There is a project on foot to extend the Schuylkill Electric Railroad Company's road from West Woods Junction down through the Germantown Valley, touching at Cressona and other towns on the route. The company hold franchises for the right of way through North Manheim township and will in all probability build a road through that section.

Harrisburg, Pa.—The Senate has passed the bill extending to cities of the first, second and third classes the act authorizing boroughs to manufacture electricity for municipal purposes. The bill authorizing street railways to carry freight passed third reading in the House.

Denison, Tex.—The Electric Street Railroad Company, organized in this city, have applied for a charter. The capital stock is $50,000. Directors: C. D. Witherspoon, Denton; P. H. Tobin, E. H. Lingo, T. E. Horan, A. F. Platter, George McLeggan, Tim Murphy, Denison.

St. Louis, Mo.—A franchise has been granted to the King's Highway Railroad Company, giving them the right to construct, maintain and operate a double track passenger street railway with electricity as a motive power. The road will be a suburban line connecting with an established line in this city.

Philadelphia.—All trolley cars in this city must be equipped with fenders by June 25, and there is consequently much looking about for fenders that will fend at a cost not too exhaustive of dividends. The penalty for non-compliance within the specified time is $10 a day for each car run without a fender, and after thirty days $40 a day for each car.

Los Angeles, Cal.—The Los Angeles and Santa Monica Electric Railway Company has been incorporated to build a railway between the places named in the title. The road will have a branch fifteen miles long to Pasadena and another five miles long to Cold Water Canyon, leaving the main line about ten miles west of Los Angeles.

Annapolis, Md.—President W. S. Musgrove of the Bay Ridge Improvement Company is meeting with encouragement in his efforts to provide an electric railway for public use in this city. The proposed line would connect the two railroad depots, the State House and the United States Government grounds, which are the principal points of interest in the old capital.

Neenah, Wis.—O. L. Huie, acting for the Central Wisconsin Electric Railway Company, has served notice on the supervisors of the towns of Oshkosh, Vinland, Neenah, Menasha, Grand Chute and Harrison to the effect that the franchises heretofore granted to J. K. Tollotson have been assigned by him to the above-named company, who will carry out the same as soon as practicable.

Belleville, Mich.—The town board has granted a franchise to an electric railroad company for a route through the township of Van Buren. The proposed road is to run from Ann Arbor to Detroit, via Ypsilanti, Wayne, and Dearborn, on the gravel road. Eastern capitalists are backing the enterprise. The company promises cheaper rates from Ann Arbor to Detroit than the Michigan Central Railroad now offers.

Pittsburg, Pa.—The Duquesne Traction Company proposes to extend its electric line to Verona, Oakmont and Hulton, and the Citizens' Traction Company has a similar project in view.—The new electric air line to Carnegie will be commenced this summer as soon as the plans for the bridge across the Monongahela River have been approved by the Secretary of War. The road will be exactly five miles long.

Louisville, Ky.—The Citizens' General Electric Company has issued a circular announcing an advance in its rates for incandescent lights after the 1st of May. The price after that date will be 20 cents per 1,000 watts, with a discount of 30 per cent. if paid before the 10th the month. The present rate is 10 cents per 1,000. The Louisville Electric Light Company has also increased its rates.

Hornellsville, N. Y.—There is considerable talk of an electric railroad from Hornellsville through Howard, Bath and Urbana, along the west side of Lake Keuka to Penn Yan. It is said a company has been formed with a large capital with this end in view. If the scheme materializes it is thought an electric plant will be located at Bath which will furnish power for the road and also for lighting the village.

Hartford, Conn.—The *Post* states that Chas. Barrows, of this city, has sold a two-thirds interest in the storage battery electric street car which he recently patented to Massachusetts parties, and a trial car is being built which will be tested on the Brockton, Mass., street railroad. If the result is successful a strong company will be formed to manufacture the cars. The chief feature is the trucks—which have a novel system of traction.

Waco, Tex.—The electric railway and the light plant of the Waco Electric Railway and Light Company, are to be sold May 7 by order of Judge Goodrich. The company is in the hands of a receiver and the sale is ordered for the purpose of winding up its affairs. The Waco Gas and Citizens' Street Railway companies have secured control of $164,000 of the $200,000 bonds of the insolvent company, and in all probability will get the property.

Catonsville, Md.—The stockholders of the Edmondson Avenue, Catonsville and Ellicott City Electric Railway Company, whose line is one of the links in the proposed electric railway between Baltimore and Washington, have elected the following directors: George Yakel, Robert Biggs, Louis Yakel, Dr. H. J. Berkley, John Hubner, B. N. Baker and David M. Newbold. The officers are: President, George Yakel; treasurer, Louis Yakel; secretary, William L. Layfield.

Wilmington, Del.—The Electric Construction and Supply Company of this city, who were the successful bidders for furnishing the Government with the electrical material for the electric plant for Fort Delaware, have received official notice to go ahead with the work and have entered into bond with the United States for the completion of same. Work on the plant will begin April 20, and will include a complete electric power, light and trolley system.

Birmingham, Ala.—The indications are that Birmingham will soon have the largest electric power-house in the South. It is understood that plans are already prepared for a building 150 feet square, completely equipped in every particular and prepared to furnish power for industries large and small throughout the entire Jones Valley. It is also understood that one of the leading railroad companies of this city will convert their extensive line of steam roads into electric roads.

Austin, Tex.—It has been decided to have an International Regatta and Electrical Exposition in this city in June, and to have the National Travelers' Protective Association members attend in a body. Gaudaur, Stansberry, Peterson, Hanlan and other oarsmen have agreed to enter for the regatta. The Electrical Exposition will be free to every manufacturer who desires to exhibit his machinery. The motive power will be furnished free. The exposition is to celebrate the completion of Austin's dam and water and electric light plant at a cost of $1,250,000.

Stroudsburg, Pa.—The Middletown and Goshen Traction Company has purchased the property, rights and franchises of the Delaware Valley Electric Railway Company which proposed to build an electric railroad to Port Jervis, N. Y., from East Stroudsburg. The officers of the Middletown and Goshen Company are: James C. Hinchcliffe, of Paterson, president; M. J. Wightman, vice-president and electrical engineer; W. B. Rockwell, treasurer, and E. G. Wightman, secretary.

Jersey City, N. J.—It is said that Abram S. Hewitt, who is the owner of the Greenwood Lake Railroad (steam), has been studying a project of operating that road entirely by electricity with the main source of power to be derived from the outflow of Greenwood Lake, which supplies the Morris Canal with a constant flow of water. Upon the stream in the Cooper and Hewitt tract at several points there is a good fall and it is believed that a constant power, sufficient to operate the road from the lake to Jersey City, can easily be obtained.

Boston.—A trolley postal service is being arranged here which, it is thought, will be the most complete system yet established in this country. There will be six distinct routes leading to the suburbs wherever the trolley lines extend, and the plan is to have the cars collect mail at the stations, sort it on the way in and have it ready for immediate delivery on arrival at the central office. The same course will be pursued, as far as possible, in taking mail from the central office and sorting it for street delivery on the cars.

Spokane, Wash.—Several months ago L. S. Roberts obtained a general electric franchise from the city, to run fifty years, agreeing to pay an increasing royalty upon it each year. One payment of $500 was made, but the second $500 payment lapsed and last week an ordinance to repeal the franchise was introduced in the council. It was referred to the committee on judiciary and legislation, who have reported recommending not only that the franchise be not revoked but that suit be brought against Mr. Roberts to recover the second payment of $500.

Hempstead, L. I.—A project that is interesting this part of Long Island is the proposed electric road connecting the villages of Roslyn, Port Washington and Thomaston or Great Neck, forming a triangular system about fifteen miles long. Among the interested parties are Jesse H. Bunnell, senior partner in the electrical supply firm of J. H. Bunnell & Co., of New York; Thomas Mott, of Sands Point, president of the Queens County Agricultural Society; Thomas Fay, of the Standard Oil Company, and J. H. King, of the Union Mortar Works, which recently erected immense factories on the west shore of Hempstead harbor.

Atlanta, Ga.—The Georgia Electric Company, of which H. M. Atkinson is president, has been awarded the contract for the city's lights for the next five years. Under the new contract the price of arc lights is reduced from $100 to $85 per year, and of incandescent lights from $40 to $35 per year, making a saving to the city of $9,000 per year, or of $45,000 for the five years for which the contract is binding. It is further agreed that the Georgia Electric Company shall reduce the price of commercial lighting 25 per cent, and as the sum of $50,000 is now paid every year for electric lighting for residences and business purposes, there will be a saving of $12,500 a year to the consumers.

Chicago.—The Chicago Electric Company's power house, from which power is furnished to the North Side trolley lines, is about completed. The building is 124 x 245 feet, and is equipped with fine machinery. The engine room contains four Fraser & Chalmers cross compound Corliss engines, horizontal and condensing, and rated at 1,000 horse power maximum capacity. Siemens & Halske generators are coupled directly to the engine shafts, one for each engine. They are of the street railroad type, compound wound for 525 volts. The eight field magnets are inside of the armature. The armature is of the Gramme type, made of copper bars. The switchboard is in two tiers. The upper board, in a gallery 160 feet long, contains forty feeder panels, each one carrying an automatic circuit-breaker and a switch. The lower board, on a level with the floor of the engine-room, is used for handling and the regulation of the dynamos. The entire switchboard is built of enameled slate, supported by an iron frame. The instruments are chiefly of Weston make.—The Baird Electric Conduit Company, recently incorporated, claim to have secured the consents of 75 per cent. of the property holders along Indiana avenue for a street railway constructed on their conduit system, which the inventor claims is "thoroughly insulated and so compact and simple that no part can get out of order. The return being insulated the same as the lead, the corrosion of water, gas piping, etc., is entirely prevented. Water, dirt, alkalies will not affect the system and there is no open slot for young America to monkey with."

Newark, N. J.—The following is given as the estimated cost of the entire system of the New York and Philadelphia Traction Company, by division, the calculations being based on actual experience in electrical railroad building: Paterson City and Passaic, 32 miles, cost $1,500,000; Paterson to South Orange, including City of Orange and Bloomfield, 30 m., $600.000; South Orange to Westfield, 11 m., $275,000; Westfield, Rahway, Elizabeth to Springfield, 10 m., $300,000; Elizabeth to Bound Brook, including City of Plainfield, 25 m., $650,000; Raritan to New Brunswick, including New Brunswick, 19 m., $600,000; Bound Brook to Kingston, 16 m., $400,000; Kingston to Trenton, 14 m., $350,000; City of Trenton, 32 m., $1,200,000; Trenton to Burlington, 16 m., $400,000; Burlington to Camden, 18 m., $450,000; City of Camden, 32 m., $1,200,000; Trenton to Frankford, 20 m., $500,000; Plainfield to Metuchen and New Brunswick, 10 m., $250,000; New Brunswick to South Amboy, 16 m., $400.000. Total, 301 miles at a cost of $9,575,000. The road is calculated to connect practically with every steam road in the State and with almost every electric road between the Hudson River and Cape May. It forms a connection between the Metropolitan Traction Company of New York, the Consolidated Traction Company of Newark and Jersey City, and the Philadelphia Traction Company of Philadelphia, all three of which are practically controlled by the same interests and represented by John D. Crimmins, of New York, B. M. Shanley, of Newark, and Messrs. Widener and Elkins, of Philadelphia.

Telephone and Telegraph.

The mayor of Chattanooga, on reading the report of the telephone committee giving the new rates of the East Tennessee Telephone Company, recommended that the city council suspend action on granting a franchise to the People's Telephone Company. The ordinance granting this franchise had passed to its second reading.

The Postal Telegraph Company has asked the council of Quincy, Ill., for the right to construct and maintain telegraph lines in the streets of that city, connecting with a central office.

A resolution is now before the Connecticut Legislature for the incorporation of a company to be known as the People's Telephone Company. The capital stock is not to exceed $500,000. Ex-Gov. T. M. Waller, J. E. Bowles, J. Irving and J. J. Lawton are named as incorporators.

At New Castle, Ind., R. H. Cokefair has a force of men at work constructing a telephone system. The Harrison instrument will be used, at $2 a month for business houses and $1 for residences. The Central Union people have given notice that they will erect a plant.

A telephone line between Marshfield place and Hewitt, in which is used one of the wires of a barbed wire fence extending along the Wisconsin Railroad tracks, has been such a practical success, says the Fond du Lac *Reporter*, that it will be extended to Auburndale.

Articles of incorporation have been filed at Minneapolis by the Standard Telephone and Electric Company which intends to manufacture telephones and electrical apparatus. The capital stock is $50,000. Incorporators: Samuel S. Kilvington, H. C. Dodge, George Batchelder and George L. Scott.

The Universal Telephone Company of Indianapolis, just incorporated, was formed for the purpose of manufacturing a transmitter which it is claimed is superior to the one used by the Bell Telephone Company. Robert Martindale, one of the directors of the new company, secured a patent for the transmitter some years ago, but as it was claimed it was an infringement no attempt was made to put it on the market until the Bell patent expired.

A representative of the American Construction Telephone Company of Anderson, Ind., is making efforts to get up a local telephone stock company in Memphis, Tenn., and introduce there the Hunting transmitter which he says is popular in Europe and manufactured at Kokomo, Ind.

The grain men in Decatur, Ill., and vicinity have decided to erect a telephone line of their own. Each of the dealers has stock in the company, which is capitalized at $5,000. On the circuit will be several towns that have no telephones now.

The city council of Anderson, Ind., without a dissenting vote, passed the ordinance giving the Harrison Telephone Company a franchise in that city. The Bell Company there has reduced its rates to $40 and $30. The Harrison rate will be $30 and $18.

The Make or Break Telephone Company has filed articles of incorporation at Trenton, N. J. The paid in capital is $25,000. The object of the company is to sell, lease and repair telephones and construct telephone lines. Incorporators: John W. Hamer, of Beverly, N. J.; John P. Logan and Aubrey H. Gillingham, of Philadelphia.

In Davenport, Iowa, a citizens' committee proposes to organize a local company and negotiate with the Harrison Company for the establishment of a telephone plant.

Three companies are asking for telephone franchises at Ishpeming, Mich., each of them desiring to furnish service to a group of cities in the northern part of the Michigan peninsula.

Papers are being circulated in Marshalltown, Iowa., for a new telephone service.

At Madison, Ind., J. W. Scott, Allison Scott, Edward Marks, Isaac Taylor and others have applied to council for the right to establish a telephone exchange, their rates being put at $2 a month for business and $1.50 for residences.

L. C. Boyle and others, of Viroqua, Wis., have decided to open a telephone exchange there as soon as they have settled upon the most desirable system.

The Western Union Telegraph Company has

just completed a new wire from Butte to Logan, Mont., over the Bozeman branch to meet the demand of the increasing business at points on that road.

The Standard Telephone Company has completed its New Orleans organization, which will be under the management of Capt. Harry Allen, whose district will include Louisiana, Mississippi, Alabama, Georgia and Florida.

The Central Standard Telephone Company pledges itself through its secretary and manager, Griffith Coit, to give St. Louis an excellent telephone service at a charge of $3 per month to business houses and $2 per month to private families.

The Orange County Telephone Company is the name of a company recently organized in Middletown, N. Y. A telephone system will be put in operation which will include not only that city, but Goshen, Warwick, Montgomery, Walden, Newburg, Bloomingburg, Ellenville, Port Jervis, Monticello, Unionville and all the neighboring villages.

The directors of the new Citizens' Co-operative Telephone Association of Shreveport, La., have elected the following officers: W. F. Taylor, president; S. B. Johnson, vice-president; L. M. Carter, treasurer; J. W. Taber, secretary and general manager. Executive Committee: Levi Cooper, C. S. Steere, S. B. Johnson, Ben Holzman and H. F. Doll.

A company has been formed at Keithsburg to construct a telephone line connecting all the important towns in Mercer County, Ill.

Articles of incorporation have been filed by the Standard Telephone and Electric Company of Minneapolis with a capital stock of $50,000. S. S. Kilvington, E. W. Batchelder, H. C. Dodge and G. L. Scott are the incorporators.

A number of the citizens of Brazil, Ind.. have in contemplation the formation of a home corporation to put in a telephone plant that will give the people a service at $1 per month.

The representatives of the Phœnix Telephone Company have made a proposition to the Board of Works of Indianapolis to furnish telephones to business houses for $3 a month and to private residences for $2. if granted a franchise. They would furnish the city telephones for $18 a year, and put in separate lines for police and fire department use.

A dispatch to the Kansas City *Times* from Guthrie, Ok., states that a company has been organized in Guthrie to build a telephone circuit connecting all the towns in seven counties in that section.

At Tampa, Fla., the Citizens' Telephone Company has been organized with the following officers: S. J. Drawdy, president; A. C. Clewis, vice-president; John Trice, treasurer; C. H. Keller, secretary and manager. S. J. Drawdy, A. C. Clewis, C. W. Stevens, John Trice, Frank Bentley, F. C. Bowyer and Hon. Peter O. Knight, directors. The company is capitalized at $12,000; it expects to have its line in operation in ninety days.

It is reported at Deadwood, S. D., that the Postal Telegraph Company will soon extend its lines into the Black Hills towns. Ever since the Black Hills were well settled, the Western Union has had a monopoly of the telegraph business there.

The New Orleans *States* says that the telephone company which has been doing business in that city for several years at its own rates is soon to have a number of competitors. Applications for franchises by companies offering much lower rates are just now adding special interest to the council's proceedings.

Articles of incorporation have been filed with the Secretary of State at St. Paul, Minn., by the White Bear Telephone Company. The capital stock is $10,000; the incorporators are John L. Pratt, of Chicago, and James L. Brass, James Berlingett, Tracy Lyon and Robert C. Wright, of St. Paul.

The Bell Telephone Company is making arrangements to place Atlanta, Ga., in telephonic communication with the entire country. A line direct to New York will be opened in another year and with its completion Atlanta will be the center of telephonic communication for the entire South.

The Southern Michigan Telephone Company has lately erected lines connecting Battle Creek with a number of towns and villages in the surrounding country, making it a telephone center of considerable importance.

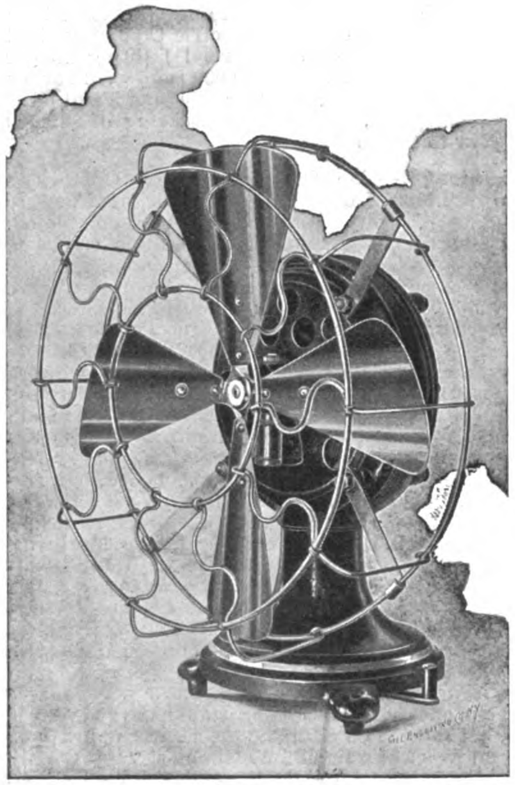
An ordinance authorizing the South Jersey Telephone Company to put in a telephone system at Cape May has passed its second reading in the city council.

The New York and Eastern Telephone Company intend to extend their lines in Brooklyn and are preparing for a large amount of wiring and other work. The recent decision of the court sustaining their right to a business footing in the city is gratifying to the friends and patrons of the company.

Lundell Alternating Fan Motor Outfits.

The demand for an alternating fan motor as attractive as the Lundell Direct Current Fan Motor is now met by the latest production of the Interior Conduit and Insulation Company.

In appearance the Lundell Alternating Fan Motor Outfit, illustrated herewith, presents a beauty of design and finish equal to that of the direct current outfit, having a cylindrical field-magnet on a hollow cast-iron base. It is designed in two types, high frequency (14,000 to 16,000 alternations per minute) and low frequency (7,200 alternations per minute), at 52 and 104 volts.



LUNDELL ALTERNATING FAN MOTOR.

Tests of the high frequency motors show that a current of 1.8 amperes at 52 volts with 12" fan is a fair average for their operation.

Like the Lundell Direct Current Motors, they are superbly finished in rich black japanning with gilt stripings. All outside brass fittings, fans and guards are either polished brass or nickel-plated. Self-oiling and self-aligning bearings and a regulating switch giving three speeds are also features.

These motors are manufactured under the patents of Robert Lundell by the Interior Conduit and Insulation Company of New York City.

Phœnix Interior Telephones.

The Phœnix Interior Telephone Company, 131 Liberty street, New York, has just recently closed contracts for the installation of seventeen Inter-Connecting 'Phones in the publishing house of McLaughlin Bros., Brooklyn, and for nine instruments of the same class for Flint, Eddy & Co., of New York. Among the recent installations by this company are: Royal Baking Powder Company, J. C. Hoglan, Wall street; Passavant & Co., Church and Lispenard streets; Metropolitan Rubber Company, Colored Orphan Asylum, House of Good Shepherd, Brooklyn, and numerous other smaller contracts.

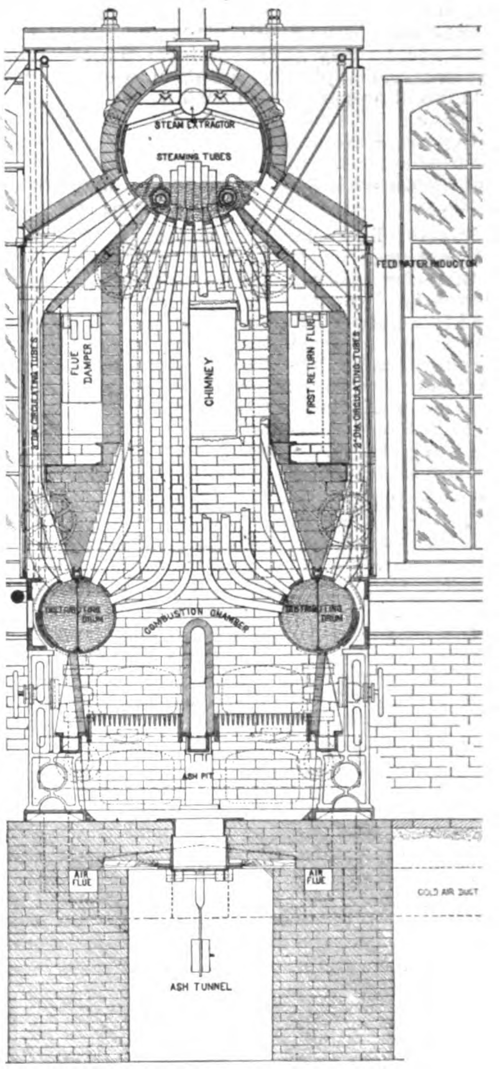
Keystone Electric Motors.

The Keystone Electric Company of Erie, Pa., has issued a very handsomely printed catalogue giving valuable information concerning their well-known Reversible Motor for elevator use. The company is doing a profitable business, with daily increasing sales.

This company has recently closed one of the largest contracts on record in their special line—for 150 motors of different sizes for elevator service.

The Hogan Boiler.

The construction of a boiler which maintains a high evaporative efficiency under minimum, maximum and excessive demands for steam; which produces a positive and continuous circulation; which insures dry steam at all times regardless of the conditions of firing or use; in which there is instant and continuous precipitation of all sediment in the water; in which no joints are exposed to the fire; in which the tubes are not liable to injury from expansion, sagging, accumulations of sediment, internal or external, or overheating; which is adapted to all kinds of fuel; which is applicable alike to land and marine uses, has long been sought for by both boiler designers and steam users. For two years past the Hogan Boiler Company, of Middletown, N.Y., have been working on this problem, and the success with which they have met, and the manner of overcoming all the attendant difficulties in its solution, were ably and satisfactorily demonstrated by a public test at the works of the company on Tuesday last. In the presence of a number of prominent members of the engineering societies of New York and elsewhere, of representative manufacturers and steam users, and representatives of the trade press, a 100 horse power boiler was exhibited in operation, and an inspection of the company's works was made by the visiting delegations. The company has installed two boilers. The first was put in operation at the State Homœopathic Asylum at Middletown, N. Y., last June. The nominal rating of this boiler is 350 horse power. The general average of a series of tests, conducted in person by Prof. R. C. Carpenter and W. R. Eckart, Jr., of Cornell University—the tests numbering twenty-three in all—show that the evaporative efficiency of this boiler running on steam coal was 13.68 lbs of water; with ordinary soft coal 12.30 lbs., and with anthracite pea coal 12.65 lbs. of water per pound of combustible. In these tests, designated "running tests," the starting and dumping of fires were eliminated. During one of the tests a maximum horse power of 665 was attained for a period of two hours, the average for the entire test being 418.04, and the evaporative efficiency, based upon the theoretical power of one pound of combustible as sufficient to evaporate fourteen pounds of water, was 83 per cent. "This high result," Prof. Carpenter says, "has seldom been obtained in any boiler, even under the most favorable conditions."



HOGAN BOILER.—SECTIONAL ELEVATION.

Boiler No. 2 is rated at 100 horse power, and is installed at the company's works. This boiler was subjected to the public test, a committee consisting of Paul Grimm, M. E., M. N. Forney, of the *American Engineer and Railroad Journal*, and John Hopson, of New Britain, Conn., conducting the tests. Their report has not yet been tabulated, but it can safely be said that it establishes the truthfulness of the remarkable statements the company have made concerning the performance of their boilers.

The boiler consists of two horizontal steam drums, each connected by 2-inch boiler tubes with vertical manifolds. The manifolds are in two rows, one on each side of the combustion chamber. The tubes are expanded in the usual way into the manifolds and the steam drum, the joints being so placed that the direct action of the heat of the fire does not affect them. The tubes constitute all the heat-absorbing surfaces of the boiler, and are the only parts exposed to the fire, and they are placed directly over the grate. Ouside of the furnace side walls are placed the distributing drums, to the upper side of which all the manifolds are connected. The front end of the distributing and steam drums are connected by 6 and 10 inch. pipe. In the latter are placed the feed-water heaters. The back ends of the distributing drums are connected to the circulating drums, the lower part of the back end to the mud drum. The mud drum is placed outside of the back wall of the furnace, wholly removed from the flues and heated gases. The upper sides and also the tops of the circulating drums are connected to the lower ends of the steam drums.

By reference to the accompanying cut, showing sectional elevation of the boiler, the circulation of the water will be observed to take the following course: In the feed-water inductor, the cold water passes down and up, absorbing heat from the descending current from the steam drum and becoming a part of this current on passing through a series of perforations near the top of the 10-inch pipe which connects the steam and distributing drum.

The descending currents pass through the circulating drum to the distributing drum; the latter receiving the impurities of the water and discharging them into the mud drum. The ascending currents pass from the distributing drum to the manifolds, thence through the 2-inch steaming tubes to the steam drum. From the steam drum a row of 8-inch internal circulation tubes extends to the circulating drum through which the descending current passes on its perpetual round of circulation. These tubes are insulated from the heat of the furnace and their use entirely prevents the mixing of the water with the steam as it is produced.

The steaming tubes exposed to the greatest heat of the furnace are extended into the steam drum, and discharge their contents entirely above the water level. It follows, therefore, that the water to supply the circulation must come from the bottom of the steam drum, and consequently the current must always be in one direction. The tubes receiving less heat are submerged in the water of the steam drum and are denominated water-heating tubes. The tubes entirely removed from the heat are connected to the lower sides of the steam drum and from the path for the descending discharge into the circulating drums. In the steam drum the splashing of water by active circulation from the steaming tubes into the steam space is prevented by a perforated plate placed above the tube openings. Dry steam is thus constantly produced and without the necessity of superheating. Tests made by Prof. Carpenter show the percentage of moisture to have been as low as 0.58 per cent.

The Hogan Boiler Company is officered as follows President, N. D. Stratton; vice-president, Geo. N. Clemson; treasurer, C. Macardell; secretary, S. S. Mallett. J. J. Hogan, the inventor of the boiler, is mechanical engineer. Several large contracts have already been closed by the company.

Walker Company's Sales.

The Walker Manufacturing Company, Cleveland, Ohio, have closed the following contracts since April 1, 1895, all for speedy deliveries, which will show the popularity which their improved generators and motors are gaining. Their shops are now running both day and night;

St. Charles Street Railroad Company, New Orleans, La., three 200 K. W. direct-coupled generators.

Corning and Painted Post Street Railway Company, Corning, N. Y., two 125 K. W. direct-coupled generators.

Messrs. Channon & Wheeler, Quincy, Ill., one 75 K. W. belted power generator.

Manhattan Beach Hotel and Land Company, New York City, one 60 K. W. belted lighting generator.

Norfolk and Ocean View Railroad Company, Norfolk, Va., two 250 K. W. belted generators; three double car equipments, six 50 H. P. steel motors; two double car equipments, four 30 H. P. steel motors.

E. A. Darling, Superintendent Columbia College, New York City, one 50 K. W. belted lighting generator.

Buffalo, Kenmore and Tonawanda Electric Railway Company, Buffalo, N. Y., two double car equipments, four 25 H. P. steel motors.

Stern & Silverman, Philadelphia, Pa., for Rapid Railway Company, Detroit, Mich., two 200 K. W. belted generators; eight double car equipments, sixteen 50 H. P. steel motors.

Dunkirk and Fredonia Railroad Company, Fredonia, N. Y., one double car equipment, two 25 H. P. steel motors.

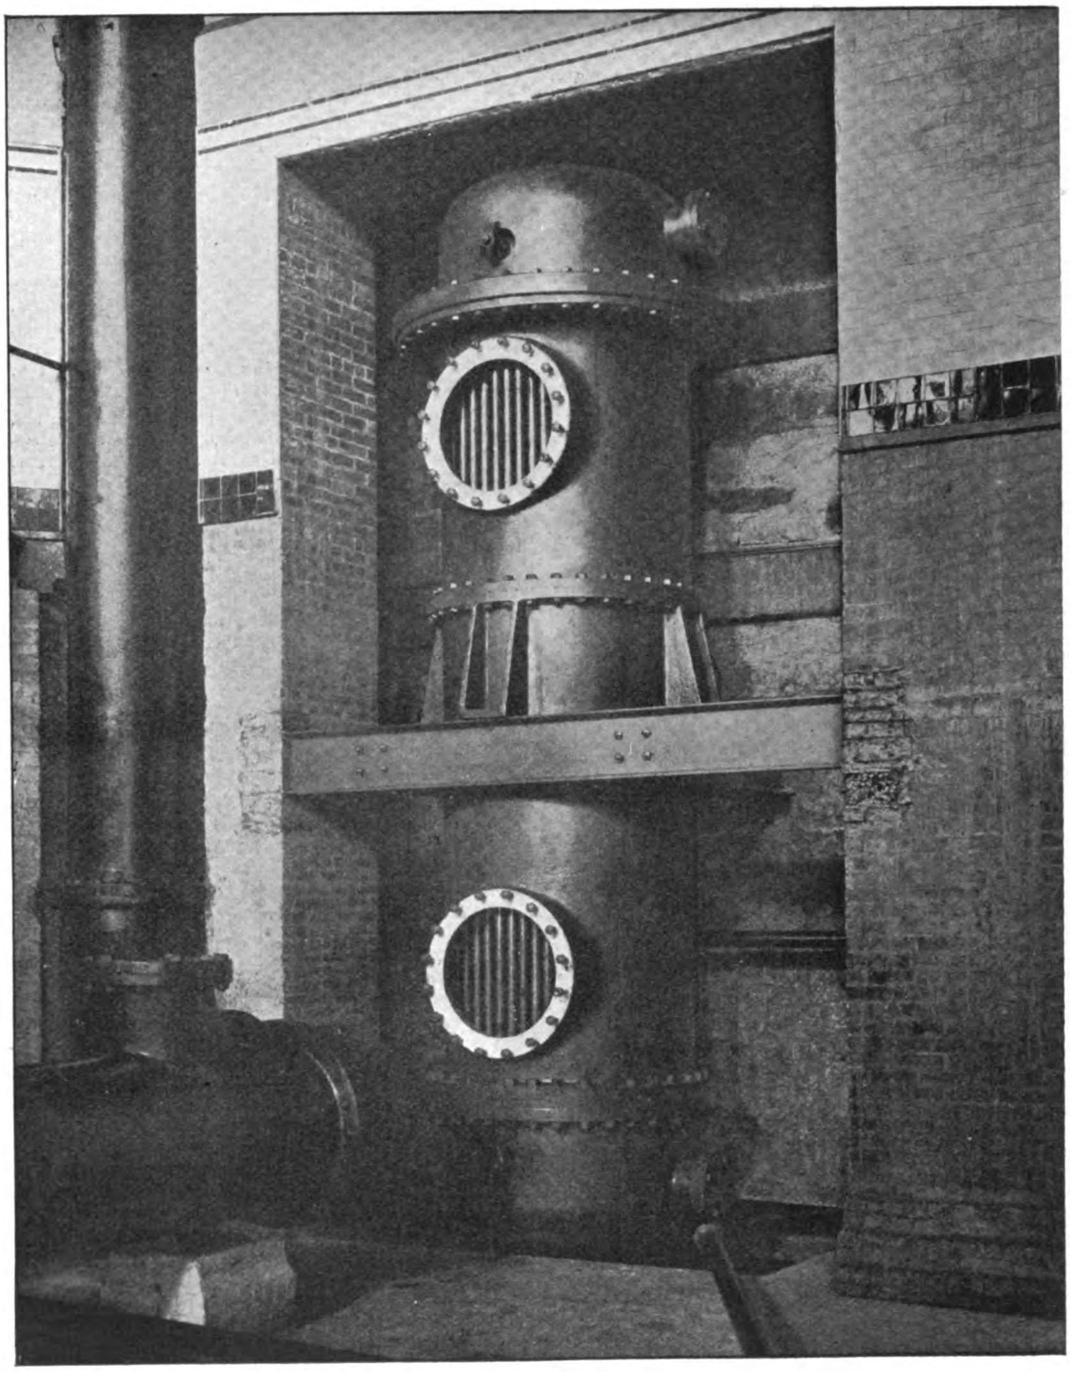
Schenley Park and Highlands Railway Company, Pittsburg, Pa., three double car equipments, six 30 H. P. steel motors.

There has also been a marked increase in their orders for general work as well as electrical work.

A 4,000 Horse-Power Goubert Heater.

The Goubert Manufacturing Company, located at 14 and 16 Church street, New York City, have recently installed at the First District Station of the Edison Electric Illuminating Company, Pearl street, Brooklyn, N.Y., a 4,000 H. P. vertical Goubert Feed Water Heater. A good view of this immense heater—one of the largest ever built—is shown in the engraving on this page. It is a most perfect piece of work and designed expressly to fit into the limited space available.

The heater is made entirely of cast-iron and brass, and is of the latest improved Goubert type, with curved upper and lower tube plates and patent flexible expansion joint. This is the only joint in the heater that is not rigid, the differential expansion between the shell and the brass tubes being taken care of at this point.



4,000 Horse-Power Goubert Heater.

The Goubert Heater is especially desirable in connection with plants of magnitude and heavy duty; in fact it is the only one made for the high pressures that are now so frequently used.

The Goubert Manufacturing Company is doing an extensive business in large units, especially for electric plants, both lighting and traction, operated by the principal companies throughout the country. It now has branch offices in many of the principal cities.

Mather Electric Company.

The Mather Electric Company of Manchester, Conn., report a continuation of the large amount of new business which has been secured. The following sales were made last week:

The C. Weyand Brewing Company, Buffalo, N. Y., one 40 K. W. Direct Connected Generator.

Robert Walker, M. D., Warnerville, Pa., one 100 Light and one 250 Light Ring Type Dynamo.

G. M. Angier & Co., Boston, Mass., one 8 H. P. Manchester Motor and one 250 Light Ring Type Dynamo.

William Oswald, New Orleans, La., three 5 H. P., one 10 H. P., one 15 H. P. and one 30 H. P. Manchester Type Motors.

Through J. Holt Gates, of Chicago, Western contractor, one 60 K. W. 220 volt Multipolar Generator to be direct connected to Ideal engine, Westville Coal Company, Danville, Ill.; also one 60 K. W. 220 volt Multipolar Generator and one 85 K. W. 220 volt for other electric coal mining works, of which class of work the Mather Company is making a specialty; also one 30 K. W. and one 45 K. W. Multipolar Generator for isolated lighting works.

B. F. Sturtevant & Co., Chicago, two 20 H. P. Manchester Type Motors.

Burtis & Howard, Minneapolis, Minn., one 250 Light Ring Type Dynamo, third order.

A Catalogue of House Goods, Etc.

Messrs. Partrick & Carter, one of the oldest electrical supply concerns in the country, have issued an elaborate catalogue of House Goods and General Electrical Supplies which ought to be appreciated by dealers in every community.

They carry a complete line, not equalled by any other concern in the country. As an evidence of the popularity of the Hotel Annunciators made by them, it takes eleven pages of the catalogue to enumerate the hotels in which they are in use.

Prices, terms of sale, discounts, etc., are all plainly given. Four pages are required for the index, which shows the comprehensive character of the catalogue.

An Attractive Folder.

The Beacon Lamp Company of Boston are sending out an attractive folder, giving the special points of merit claimed for the Beacon Lamp, with prices.

INCORPORATIONS.

The Mascot Electric Light, Heat and Power Company, Ouray, Col.—to produce electric current for furnishing light, heat and power to the town of Ouray, Col. Capital stock, $100,000. Promoters: B B. Clauson, Chas. A. Armstrong, T. W. Emerson, all of Ouray, Col.

The Kelly Watch Company, Chicago, Ill.—to manufacture and sell time-pieces, electric and automatic devices and all kindred mechanisms. Capital stock, $20,000. Promoters: Thos. F. Kelly, Thos. J. O'Hare, Robt. J. Bieg.

The Atlantic Highlands, Red Bank and Long Branch Electric Railway Company, Red Bank, N. J.—to construct and operate motors, cables and other machinery for supplying motive power to street railroads, and to construct and operate street railways. Capital stock, $500,000. Promoters: David S. Arnott, Wm. H. Hazard, Silas B. Dutcher, Sam'l S. Whitehouse, Brooklyn, N. Y.

The Seattle and Alaska Mining and Milling Company, Seattle, Wash.—to erect and maintain water and electric power, mine and market ores of precious metals, etc. Capital stock, $250,000. Promoters: Wm. M. Ebner, W. E. Crews, J. E. Fox, W. D. O'Toole, P. F. Smith.

San Joaquin Electric Company, Fresno, Cal.—to buy, sell and deal in electrical inventions, patents, etc.; buy, sell, lease, maintain and operate electrical plants of all kinds; manufacture and sell electricity; deal in real and personal property. Capital stock, $800,000. Promoters: John J. Seymore, John S. Eastwood, Henry Sherwood, O. W. Woodward, L. L. Cory, of Fresno.

The Taylor Electric Light Company, Taylor, Tex.—to manufacture and supply gas, electric light, heat and power to the public. Capital stock, $20,000. Promoters: Hugh Burns, F. L. Welch, Bernard Garry, of Taylor.

The Denison Street and Electric Railway Company, Denison, Tex.—to construct and operate street railways and suburban or belt lines of railway in or near Denison, etc. Capital stock, $50,000. Promoters: A. F. Platter, G. McKegan, P. H. Tobin, T. Murphy, E. H. Lingo, of Denison.

The Belle Vernon Electric Light and Power Company, Belle Vernon, Pa.—to generate light and power by means of electricity. Capital stock, $1,000. Promoters: Sam'l M. Graham, C. F. Eggers, Adolph C. Hamm, Belle Vernon.

The Waco Electrical Supply and Construction Company, Waco, Tex.—to buy and sell goods, wares and merchandise by wholesale. Capital stock, $10,000. Promoters: W. W. Seley, S. A. Hobson, A. P. Moore, Waco.

The Hartford Light and Power Company, Hartford City, Ind. Capital stock, $30,000. Promoters: Wm. N. Forbis, Monticello, Ind.; Milton H. Forbis, Cincinnati, Ohio; Albert Reynolds, Guy E. Reynolds, Hartford City, Ind.

The Adams-Bagnall Electric Company, Cleveland, Ohio—to manufacture, sell and deal in electric lamps, electric railway motors, electrical machinery, etc. Capital stock, $150,000. Promoters: Thos. E. Adams, E. J. Bagnall, Chas. C. Hickox.

The Iowa Falls Electric Light and Power Company, Iowa Falls, Iowa—to erect, maintain and operate an electric power and light plant. Capital stock, $15,000. Promoters: L. B. Bradley, H. C. Miller, J. D. McKay, Z. K. Hoag, Iowa Falls.

The Bridgeport Railroad Company, of Montgomery County, Pa.—to build an electric line from Swedesburg to Swedeland. Capital stock, $15,000. Incorporators: Daniel B. Shepp, J. W. Shepp, Edgar A. Murphy, Henry Parker, Robert L. Parkinson, Philadelphia; N. H. Larzelere, Norristown: W. B. Krick, Reading.

The Los Angeles and Santa Monica Electric Railway Company, Los Angeles, Cal.—to build and operate a railroad for freight and passengers between the points named by means of electricity, compressed air or other suitable power. Capital stock, $500,000. Directors: C. B. Van Avery, V. H. Raleigh, J. J. O'Brien, A. W. Eames, and James P. Montgomery, all of Los Angeles.

The Excelsior Novelty Company, Louisville, Ky.—to do a general electroplating business. Capital stock, $5,000. Incoporators: Geo. F. Porter, James L. B. Stinger and James R. Jackman, Jr.

The Globe Electric Construction Company of New York City—to sell and install electric equipment apparatus, appliances, etc. Capital stock, $20,000. Directors; J. J. Clark, F. F. Coen, of New York City; H. C. Mackenzie, of Roseville, N. J.; P. M. Mowrey, of Upper Montclair, N. J.

The Middletown and Bloomingburg Electric Railway Company—to operate a street railroad from Middletown, N. Y., to Bloomingburg, a distance of ten miles. Capital stock, $200,000. Directors: J. C. Hinchcliffe. John Hinchcliffe, of Paterson, N. J.; W. B. Rockwell, of Scranton, Pa.; and E. G. Wightman, F. D. La Bar, C. H. Smith, A. F. McIntyre, W. B. Royce and W. H. Wiggins, of Middletown.

The Coty and Albertson Company, Atlantic City, N. J.—to lease, buy, build and erect buildings, structures and machinery; operate and maintain the same for conducting the plumbing, gasfitting, roofing, electrical, hardware, tinware, etc., that pertains to general hardware business. Capital stock, $10,000. Promoters: Richard R. Albertson, Jos. Young, Clifton C. Shinn, Atlantic City, N. J.

The Electrolytic Insulating and Conduit Company, Springfield, Ill.—to manufacture, use and sell electric ducts, cables and all electric apparatus for transmission of power, light, heat and communication. Capital stock, $5,000,000. Promoters: H. Clay Wilson, Benj. Knudson, Jas. E. Henderson.

The City Street Railway Company, of Savanna, Ill., Savanna, Ill.—to construct, maintain and operate a street railway by animal, electric or pneumatic power. Capital stock, $25,000. Promoters: W. W. Cargill, J. B. Canterbury, Edwin B. Magill, A. D. Appleby, B. Pulford.

The Universal Telephone Company, Indianapolis, Ind.—to manufacture and sell telephones, telephone devices, electrical supplies, etc. Capital stock, $25,000. Promoters: E. B. Martindale, Chas. Martindale, Robert Martindale, Indianapolis.

The Venice, Madison and Granite City Railway Company, Venice, Ill.—to operate street railway, electric light plant, etc. Capital stock, $60,000. Incorporators: C. H. Sharman, Fred E. Allen and E. J. Spencer.

The Rockford Telephone Company, Rockford, Ill.—to construct telephone and telegraph plants, etc. Capital stock, $60,000. Incorporators: John Rames, Joel B. Whitehead, William L. Eaton and Hiram W. Buckbee.

The Rondout and Eddyville Railway Company—to build and operate a street railway by animal power, cable or electricity. Capital stock, $30,000. Directors: William T. Hiscox, Percival C. Smith, Gardner D. Hiscox, Edward B. Gallaher and Frederick C. Beach, of New York City; Joseph F. Wilson, of Brooklyn; Albert Terry, Robert F. Tompkins and John N. Cordts, of Kingston, N. Y.

The Price Hill Electric Building and Loan Association, Cincinnati. Capital stock, $500,000. Incorporators: Joseph Braner, Charles Blanchard, Heinrig Sutkamp, Thos. H. Wright and Edwin Chambers.

The W. H. Elliott Electric Company, Cleveland, Ohio. Capital stock, $10,000.

The Dover Electric Light and Power Company, Dover, N. Y.—to furnish light and power in the towns of Dover, Amenia, Washington and Pawling. Capital stock, $10,000. Directors: Adolph Reimer and Catharine Reimer, of Dover Plains, and Julius C. Minck, of Brooklyn, N. Y.

The Empire State Electric Forging Company, Syracuse, N. Y.—to manufacture electric welding, forging and smelting apparatus. Capital stock, $300,000. Directors: L. H. Gooesbeck and C. M. Warner, of Syracuse; J. O. Adsit, of Hornellsville; D. E. Mosely, of Rochester, and E. E. Woodruff, of Auburn.

The New York Electric Motor and Ventilator Company, New York City. Capital stock, $30,000. Directors: Sidney Green, of New York City, and C. A. Sherman and Lincoln Vancott, of Brooklyn.

The Tacoma Gas and Electric Company, Tacoma, Wash.—to conduct a gas and electric lighting plant, transportation lines, open and operate coal mines, etc. Capital stock, $350,000. Incorporators: C. B. Hurley, Edmund Seymour, Alfred E. Buell, C. P. Masterson, W. G. Hellar, John F. Dillon and Frederick E. Watson.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED APRIL 9, 1895

ELECTRIC RAILROADS AND APPLIANCES.

537,194. Conduit Electric Railway. John H. Guest, Boston, Mass. Filed June 18, 1894.

537,195. Conduit Electric Railway. John H. Guest, Boston, Mass. Filed April 14, 1894.

537,196. Supply System for Electric Railways. John H. Guest, Boston, Mass. Filed June 18, 1894.

537,197. Supply System for Electric Railways. John H. Guest, Boston, Mass. Filed Nov. 3, 1893.

537,198. Electric Railway. John H. Guest, Boston, Mass Filed Aug. 9, 1894.

537,199. Electric-Railway Supply System. John H. Guest, Boston, Mass. Filed Feb. 20, 1894. Renewed Feb. 2, 1895.

537,200. Closed-Conduit Electric Railway. John H. Guest, Boston, Mass. Filed April 10, 1894.

537,283. Trolley. Zachry T. Furbish and George A. Staples, Augusta, Me., assignors of one-third to P. M. Fogler, same place. Filed Sept. 24, 1894.

537,414. Closed-Conduit Electric Railway. John H. Guest, Brooklyn, N. Y. Filed Feb. 17, 1893.

537,416. Supply System for Electric Railways. John H. Guest, Boston, Mass. Filed July 6, 1893.

ELECTRIC LIGHTS AND APPLIANCES.

537,058. Incandescent Lamp. Charles A. Merritt, Birmingham, Ala. Filed Sept. 17, 1894.

537,209. Lamp. John Kirby, Jr., Dayton, Ohio, assignor to the Dayton Manufacturing Company, same place. Filed Oct. 16, 1893.

537,271. Incandescent-Lamp Base. Waldo C. Bryant, Bridgeport, Conn. Filed Dec. 20, 1894.

DYNAMO ELECTRIC MACHINERY.

537,010. Ventilating Apparatus for Dynamo-Electric Machines. George D. Burton, Boston, and Edwin E. Angell, Somerville Mass., assignors, by mesne assignments, to said Burton. Filed Dec. 7, 1892.

537,354. Traversing Apparatus for Commutators. John Pease, Apperley Bridge, England. Filed July 28, 1884.

537,412. Rheostat. John C. Fyfe, Chicago, Ill., assignor of one-half to James Hayes, same place. Filed Jan. 24, 1895.

APPARATUS FOR METAL HEATING, WELDING, ETC.

537,004. Electric Metal-Heating Process. George D. Burton, Boston, Mass. Filed Dec. 11, 1893.

537,005. Art of and Apparatus for Electrically Smelting Ore. George D. Burton, Boston, Mass. Filed April 26, 1894.

537,006. Electric-Bath Metal-Heating Apparatus. George D. Burton, Boston, Mass. Filed Aug. 24, 1893. Renewed Sept. 10, 1894.

537,007. Method of and Apparatus for Electrically Heating Metal. George D. Burton, Boston, Mass. Filed Jan. 23, 1895.

537,008. Electric Metal-Heating Apparatus. George D. Burton, Boston, and Edwin E. Angell, Somerville, Mass., assignors, by mesne assignments, to said Burton. Original application filed Sept. 5, 1892. Divided and this application filed Oct. 11, 1894.

537,009. Method and Apparatus for Electric Metal Heating. George D. Burton, Boston, and Edwin E. Angell, Somerville, Mass., assignors, by mesne assignments, to said Burton. Filed Aug. 30, 1892.

537,011. Electric-Bath Metal-Heating Apparatus. George D. Burton, Boston, and Edwin E. Angell, Somerville, Mass., assignors, by mesne assignments, to said Burton. Filed Dec. 7, 1892.

537,012. Electrical Welding Apparatus. George D. Burton, Boston, and Edwin E. Angel, Somerville, Mass., assignors, by mesne assignments, to said Burton. Filed March 3, 1893.

537,013. Apparatus for Brazing Metals by Electricity. George D. Burton, Boston, and Edwin E. Angell, Somerville, Mass., assignors, by mesne assignments, to said Burton. Filed April 17, 1893.

537,017. Machine for Closing Ends of Tubes. George D. Burton, Boston, and Edwin E. Angell, Somerville, Mass., assignors, by mesne assignments, to said Burton. Filed May 4, 1893.

537,402. Electric-Bath Metal-Heating Apparatus. George D. Burton, Boston, and Edwin E. Angell, Somerville, Mass., assignors, by mesne assignments, to said Burton. Original application filed Sept. 5, 1892. Divided and this application filed Oct. 11, 1894.

537,404. Apparatus for Electrically Heating Metal. George D. Burton, Boston, Mass. Filed Nov. 6, 1894.

537,405. Apparatus for Electrically Heating Metal. George D. Burton, Boston, Mass. Filed March 16, 1895.

SIGNALS AND SIGNALING APPARATUS.

537,133. Electric Railway Signal Apparatus. George L. Thomas, Brooklyn, assignor to the Hasell Perfected Railway Signal Company, New York, N. Y. Filed April 23, 1894.

537,161. Police-Signaling Apparatus. William H. Kirnan, Bayonne, N. J., assignor to the Gamewell Fire-Alarm Telegraph Company, New York, N. Y. Filed Dec. 28 1892.

MISCELLANEOUS.

536,996. Electrode. Harry T. Barnett, London, England. Filed Dec. 27, 1893.

537,032. Electric Clock. Fred L. Gregory, Chicago, Ill. Filed Jan. 30, 1894.

537,118. Electrical Indicator. Edward H. Johnson, New York, N. Y., assignor to the Interior Conduit and Insulation Company, same place. Filed Oct. 1, 1891.

537,124. Electrical Steering-Gear. Rodolphe Noury, Nouveau Phalere, Greece. Filed March 12, 1894.

537,130. Arc-Rupturing Device. Elmer A. Sperry, Cleveland, Ohio, assignor to James Parmelee, New York, N. Y. Filed Oct. 16, 1894.

537,149. Demagnetizer. Edward F. Gooding and George W. Scovil, Elgin, Ill. Filed Dec. 29, 1894.

537,179. Electrolysis. Henry Blumenberg, Jr., Mount Vernon, N. Y. Filed March 30, 1894.

537,228. Cut-Off or Safety Attachment for Electrical Conductors. James Parkinson, Maurice Springfield, and Charles Mills, Philadelphia, Pa. Filed Oct. 10, 1894.

537,242. Pyrometer. Alvin A. Simonds, Dayton, Ohio. Filed Dec. 13, 1894.

537,259. Non-Arcing Switch. Alexander Wurts, Pittsburg, Pa., assignor to the Westinghouse Electric and Manufacturing Company, same place. Filed April 14, 1893.

537,282. Telephony. Ellis F. Frost, Washington, D. C. Filed Dec. 20, 1894.

537,321 Insulating Compound. Alexander C. Thompson. St. Louis, Mo. Filed July 30, 1894.

537,343. Electrical Measuring-Instrument. Eugen Hartmann and Wunibald Braun, Bockenheim, Germany. Filed Nov. 27, 1891.

537,358. Electric-Battery System. Adoniram J. Powell and William H. Hall, Brooklyn, N. Y. Filed Nov. 13, 1894.

MOONLIGHT SCHEDULE FOR THE UNITED STATES.

CABLE ADDRESS, HELIOS, PHILADELPHIA,
[illegible] FILBERT ST.

February 12th,

The Washington Carbon Co.,
Pittsburgh, Pa.

Gentlemen:-

We beg to say in answer to your inquiry that we have thoroughly tested the Helios cored carbons manufactured by your company, and we find them equal in every respect to the imported Helios carbons, and vastly superior to any other cored carbon made, either domestic or imported.

We congratulate you upon your success.

Yours truly,
HELIOS ELECTRIC CO.

WESTINGHOUSE ELECTRIC & MANUFACTURING CO.,

Sole Owners of the Fundamental Patents covering

POLYPHASE ALTERNATING CURRENT MOTORS

issued by the United States Patent Office to

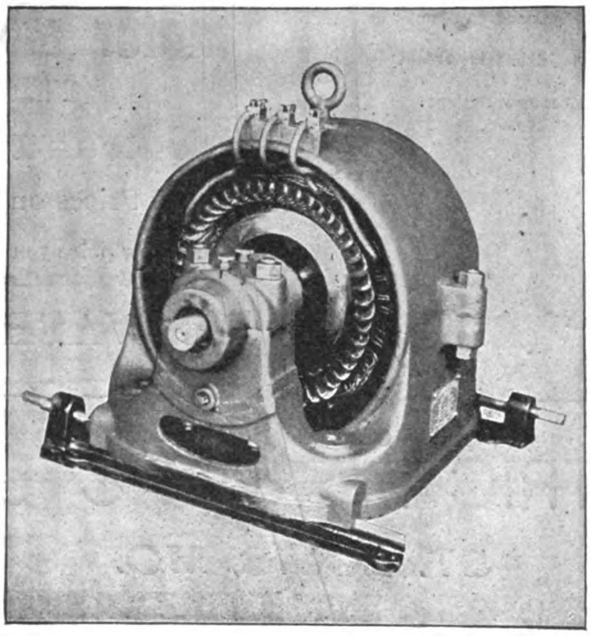
NIKOLA TESLA.

The system adopted by the Cataract Construction Company for their great plant at Niagara.

Especially adapted to transmission of power over great distances.

The ideal system for distribution of power in factories and mills.

All machinery in the New Works of the Westinghouse Electric and Manufacturing Co. at East Pittsburg, Pa., is driven by Tesla Polyphase Motors, supplied from a central power plant.



RESULTS: High Efficiency as compared with the ordinary methods of shafting and belting; Convenience, Economy and Flexibility secured.

Inspection invited.

NOTICE IS GIVEN

That induction motors operated by the so-called "Monocyclic" system offered for sale by the General Electric Company are in fact multiphase motors and are broadly covered by the patents of Nikola Tesla owned by the Westinghouse Electric and Manufacturing Company.

The motors and system of distribution advertised by the Stanley Electric Company of Pittsfield are also an infringement of the Tesla patents.

Suits have been brought against each of these companies, and are being pressed to a hearing as rapidly as possible.

It is the purpose of the Westinghouse Electric and Manufacturing Company to bring suits against *ALL USERS* of apparatus infringing the Tesla patents, in order that the rights of the company may be enforced.

"Electricity is a beneficent fairy who, with infinite tenderness, now offers to open the unexplored portions of her domain and to yield up her treasures to you from the realms of the mysterious and the unknown."—Alfred Picard, March, 1895.

"We shall not always be satisfied with seeing the laws of nature rest on their present empirical basis. The most advanced thinkers are looking forward to a period when we shall incorporate mind and matter in a single study, when we shall raise the veil and penetrate into the Secret of Things."—H. T. Buckle, 1856.

"The Veil Withdrawn."—Mrs. H. O. Ward.

"Men should be very careful how they condemn a researcher who is working on theories unknown to them."—Brownell.

TRANSATLANTIC PUBLISHING CO.,

63 Fifth Avenue, New York City.

Siemens & Halske Electric Company of America,
Siemens & Halske: Berlin, Charlottenburg, Vienna, St. Petersburg.

MANUFACTURERS OF

Direct Current Slow Speed Multipolar Generators and Motors.

These machines are constructed with *external armatures.* They have proved remarkably efficient and economical. Used largely in American and European Lighting and Railway Plants. Slow-speed machines, made for direct connection in sizes from 20 H. P. to 2,000 H. P.

ADVANTAGES OF OUR EXTERNAL ARMATURE TYPE:

Maximum peripheral speed of armature with slowest engine speed. Shortest possible winding of armature. Lowest internal resistance of armature.
Only 3 to 4 volts difference of potential between commutator bars. Greatest radiating surface possible. Maximum magnetic effect.
Greatest weight of copper per ampere of current. Armatures cannot burn out. Great compactness.
Correct mechanical design. (The centrifugal force is counteracted effectively by the inward pull of the internal field magnets.)
Finest quality of iron, excellent finish, absence of binding wire.

In 8 years' continuous service not one Armature has been replaced or repaired. **Over 200,000 H. P. in use for Railway, Lighting and Motor Service.**

WORLD'S FAIR DIPLOMA AND MEDAL FOR BEST DIRECT CONNECTED GENERATOR.

MODERATE SPEED BIPOLAR GENERATORS AND MOTORS,

With Siemens Drum Armatures, which are copied extensively in this country. We are building these machines in sizes from 1 H. P. to 150 H. P.

EDITORIAL NOTES.

Resonance in Alternating Current Lines. The electrical fraternity are much indebted to Mr. A. E. Kennelly for the clearing up of many dubious points in regard to impedance, which he so ably accomplished in a paper on that subject read before the American Institute of Electrical Engineers on April 18, 1893. That paper indeed was a most noteworthy event in alternating current literature, and brought a subject of which the majority had little definite knowledge within the grasp of all. So full and complete and clear was this paper that although much progress in the way of simplification of other branches of knowledge in the alternating current field has been made during the two years that have elapsed, scarcely anything has been added in the line of this paper. Since that time, however, a growing interest has been aroused in the phenomena of electrical resonance, in which field Dr. Pupin in this country, and Rayleigh, Thompson and others abroad, have done pioneer and valuable work.

The commercial value of these phenomena is realized when it is understood that the possibilities of extending the efficiencies of submarine telegraph and telephone cables, and the attainment of a more economical light, seem to rest upon their intelligent application. But the greatest theoretical interest in electrical resonance was aroused by Hertz's great work, which was epochal in experimental physics and linked his name with that of Fresnel, Carnot and Clifford, and identified the science of electricity with that of optics. In fact, Hertz's work was but the sprouting of the seeds sown by Faraday, Kelvin, Helmholtz, Maxwell, Stokes and Weber.

The more practical applications of these phenomena, however, have remained for the present time and the future, and with a better understanding of them the growth of science in this direction will be much stimulated.

The paper on "Resonance in Alternating Current Lines," by Messrs. Houston and Kennelly, read before the Institute at the April meeting, was therefore most timely. In this was given a most exhaustive analytical treatment of the phenomena in question which is likely to give it a rank on the same plane with Mr. Kennelly's paper on Inductance, already referred to. The paper, while clear to those versed in the technology of electrics, is too long and too technical for reproduction in these columns, and readers desiring to go more deeply into the subject are referred to the Transactions for the full paper.

The object of the paper as stated by the authors was:

(1) To present the formula expressing the variation of electric current and pressure in an alternating current circuit under the most general conditions, and in its simplest form.

(2) To present calculations for the pressure and current in any alternating current circuit by a graphical method.

(3) To investigate the effects of static capacity in an alternating current circuit.

(4) To investigate the effects of capacity and inductance on the delivery of energy at the distant end of a circuit.

And their conclusions as summarized were:

(1) The combined effect of capacity and inductance is to produce a tendency to resonance.

(2) The tendency to resonance is favored by high frequency, high insulation, high inductance, high capacity and high conductance.

(3) When the line is free at the distant end, the resonant effects are more pronounced at that end than at the generator.

(4) The determining factor for the production of resonance is the angle of the vector geometric mean C. I. D. A., and rapidly increases with the same.

(5) The complete wave-length in a resonant line is 2π times the length in which the reactances of the inductance and the capacity are equal, the maximum difference of pressure or current strength being exhibited in one-quarter of this wave-length.

(6) When resonance occurs, the current and pressure in the circuit are not in phase except at their maximum and minimum values, i. e., at the crests and troughs of the waves.

(7) In resonant circuits, the lag of the pressure and current is 90 degs. between any successive pair of maximum and minimum values.

(8) In ordinary lines, worked sinusoidally at ordinary frequencies, resonant effects are practically negligible.

(9) Prominent upper harmonics in the E. M. F. of the generator may sometimes give rise to appreciable resonant effects, although the resonance to the fundamental frequency may be inappreciable.

(10) A certain amount of capacity tends to increase the plant efficiency of the generator, and is therefore economical, but marked resonance in a line not only ceases to be economical, but is actually wasteful.

(11) Although, on a large scale, less energy can be delivered at the distant end of a powerfully resonant line than on a non-resonant line, yet a greater current strength can in some cases be delivered over a powerfully resonant line.

* * *

Hous-Kennoolyism Run Wild. Much as we are inclined to praise the substance of the paper and the exhaustive manner of treatment, we cannot refrain from criticising in the severest manner the language used. The paper was made the occasion of exhibiting in its most offensive form an aggravated type of Hous-Kennoolyism. It is very much regretted that two men whose personal and scientific qualifications so fully entitle them to the respect and honor which are everywhere accorded them should seek a cheap notoriety by striving to force down the throats of an unwilling public so many new words. This is not a new offence by any means, but to the contrary, has been repeated so often as to require the coinage of a new word for its proper designation. And this new word, which has already gained acceptance, is "Hous-Kennoolyism." Prof. A. G. Webster, of Clarke University, who took a leading part in the discussion of the paper, thought it necessary to animadvert rather severely upon this puerility or senility (whichever it may be), and if outward manifestations are a fair criterion to judge by, his remarks met the approval of the audience. He certainly made Mr. Kennelly appear in a very ridiculous light, and it is not too much for his friends to hope, as they *do* hope, that he will not again indulge in the illegitimate coinage of offensive words. The termination *ance*, has long been a favorite with Mr. Kennelly, and in this paper he freely used such terms as *susceptance*, *admittance*, dielectric-admittance, etc., etc. The term *mho* was also used as an accepted term, and the hyperbolic functions were given strange and weird names, which made us shudder, but

> "Strange things come in with the tide in the ungodly hours of the night, and in the stillness of the night strange things follow them."

Thus the hyperbolic tangent written *tan*h, was pronounced *tans*h, and the strange thing following this was the attempt to pronounce *sin*h in the same way, but without the sibilant. The hyperbolic cosine written *cosh* was pronounced as written, but everyone felt that by a typographical error the initial letter had been changed from a *g* to a *c*, and that it should read *gosh*.

A new symbolism was also at times introduced, which may have been, and doubtless was, satisfactory to the authors, but was unintelligible to their audience until translated and explained. We think this is Hous-Kennoolyism with a vengeance, and we hope that it has been made so obnoxious in this paper as to prevent its repetition.

* * *

Raising the Load Factor. It is now pretty generally understood that the discrepancy between what the electric light costs and what it ought to cost with the means at our disposal is due to the load factor of the station. Electric light men realize that if they could but employ their machinery to advantage they could produce light at but a fraction of what it now costs, and that it is the load factor of the station and not the machinery that requires improvement. Mr. H. Ward Leonard called attention to one way of accomplishing this improvement, which involved a charge for service increasing rapidly as the customer's load factor decreased. This sliding scale of charges has been tried in a number of instances abroad and the results will prove of interest whenever they can be obtained. In this issue we reprint from the *Electrician* an article by Mr. Arthur Wright, which not only gives the results of the adoption of this system by the Brighton station (London), but also gives some valuable suggestions drawn from experience, which our central station men will find interesting and instructive reading.

* * *

The Situation. Some of our esteemed contemporaries of the daily press affect surprise at the game which has been played in Wall Street during the past sixty days with G. E. stock. The stock was advanced ten points upon the report that a deal was in progress between the Westinghouse and General Electric interests, and has now lost five points upon the fact that such trade is not officially confirmed. It has not declined upon the announcement that the trade was off, because there has been no such announcement from any man in position to know, who has made any statement over his own signature.

Until such statement is made ELECTRICITY will refuse to believe that a trade has not been made. Wall Street may be fooled, but not so ELECTRICITY. We may stumble, but we never tumble. Closely in line with our information that the trade is as much alive as ever comes the well-authenticated rumor that a new issue of securities is to be put out by one of the companies. What they can cover to make them salable the Lord only knows, but that it is intended to issue them we fully believe.

It would be idle to consider in detail a subject of this nature until the world is more fully advised.

The trade is in a state of ferment; every man in the business with head enough to think is on the anxious seat, and our mail contains dozens of letters asking for private information and what our policy will be in certain contingencies.

Of the latter there ought to be no doubt. We shall continue to fight for the purification of the business, the banishment of stock-jobbing methods from any or all companies, for the end of bribery and corrupt methods in the sale of goods, for the general revolutionizing of the entire trade, until the invested dollar of the honest man will have as good a chance as that of the trickster. We shall oppose and criticise everybody and every company who stand in the way of the revolution which ELECTRICITY started in 1892. We will continue to show to stockholders that their money has been wasted by rogues who ought to be behind prison bars; that the hundreds of thousands spent for bribery had not even the justification of being applied to the corrupt purposes intended, but often remained in the pockets of officers and others trusted in the management; we will show them that their interests have not been considered, that unearned dividends have been paid to humbug them, that while their business was being conducted at a loss the rings of insiders have made fabulous amounts of money in stock-jobbing operations.

This and more we will continue to do, and nothing can stand in our way. No combination could intimidate us, and none can be formed which cannot be exploded in six months. Money must be raised for all such schemes, and ELECTRICITY may be relied on to knock the underpinning out of any one, either present or to come, before it has much success in this line. The curse of the business from the start has been the swindling of investors by specious misrepresentations and the utter disregard of investors' rights. These features are gradually dying out, and the sooner they are killed the better. That they are not dead is evidenced by the attempt now being made to float millions of securities by a storage battery concern which cannot hope to pay a 1 per cent. dividend on its capitalization in ten years except directly from the sale of stock, and by numerous less prominent examples of the same old idea. It is kept perpetually in sight by such disreputable games as have just been played in G. E. stock, and is emphasized by the fact that while the public were being scorched at the rate of $50,000 to $100,000 a day not one director of either the G. E. or Westinghouse Company has had the moral courage to come to the front with the truth and stop the robbery. And while the insiders are fattening, the money of the stockholder is disappearing, goods are being sold at a loss; while the lying claim is made that the G. E. Company's next statement will show a profit of $1,800,000, the price of incandescent lamps is reduced to a figure ensuring a loss of three cents on every lamp. But enough. The electrical industry is established to stay. There is demand enough to make a fair profit for every man engaged and every honest dollar invested in it.

The way to place it upon a sound commercial basis is not through stock-jobbing combinations, but through the extermination of those who have bedeviled it.

* * *

Opportunities in Electrical Engineering. During the past year or more much has been written on the subject of the prospects afforded the young man by an electrical career. The subject has been presented in both a favorable and an unfavorable light, but perhaps the *best written* articles have presented the view that the electrical profession was already crowded and offered little inducement in the way of emoluments to those about to enter. Some of these have been decidedly pessimistic in tone, and were it not for the recognized standing of their authors, which would preclude such a thought, would be open to a much harsher characterization. Contributions of this character have appeared in the columns of a number of our contemporaries and also in the daily press and have been widely copied and commented upon. We have read all these with feelings of pain, and are glad to present and to commend to our readers the paper by Prof. Atkinson, which presents a view more fully in accord with our own and the facts as we believe them to exist. We would, in fact, go considerably further than our contributor and say, not that an electrical career presents to-day as many opportunities as other careers, but that it presents far more. We think that one not acquainted with the situation would easily come to this conclusion from Prof. Atkinson's own arguments, and one only needs to be familiar with the situation to know that his arguments are based on facts. We think this present presentation of the case is by far the fairest and most reasonable one that has as yet appeared, and trust that it will be widely read and thoroughly digested.

Under the Searchlight.

Views and Opinions on Timely Topics.

Edison licensees are now buying Edison 16 c. p. lamps at 13 cents net.

* * *

Electricity will send the address of an A 1 station manager seeking a situation to any one having a place for him. He is one of the old-timers, and ought to turn a losing station into a paying one if he had the chance.

* * *

If a grand jury were to investigate the connection of the G. E. Company with Brooklyn railroad matters and with the St. Johnland lighting plant, the chances are ten to one that C. A. Coffin and one or more of his subordinates would land in the penitentiary. Work so dangerous and so corrupt, in the procurement of franchises, that even the railroad men themselves were afraid to do it directly, was cheerfully done by Mr. Coffin's henchmen, the G. E. Company having made a flat bargain to handle the bribery business in exchange for a sure thing on the contract for equipment. These facts are susceptible of proof. The man who left Boston with $65,000 sewed in the lining of his vest, reported to Mr. Coffin in New York, then went to the New Jersey side and paid out the money, would not be hard to locate, even now. Besides, there are others.

* * *

It is believed that the G. E. statement will contain a proposition to scale down the stock one-half, including the preferred. Of course the latter *can not* be scaled down, but it is argued that a proposition to do it will frighten the ignorant, and that there would be a chance for a ten-point movement down, and up again to somewhere near par.

* * *

The largest claim now made for the G. E. gross business for the last year is $12,000,000. This is $3,000,000 too high. A "profit" is claimed of $1,800,000, while the actual loss on manufacture and sales has been over $900,000, to say nothing of shrinkage.

* * *

We suppose we may now have a little peace. Brother Johnston has given up killing his distinctly electrical contemporaries, and will now take a few rounds out of the *Street Railway Journal and Review*. We shall enjoy it, and so will he, while his money lasts.

* * *

Profits are Not Considered.

(From the U. S. Investor.)

The control of the [G. E.] company is in the hands of New York bankers, who have delegated Mr. Ord to exercise the active management.

We are credibly informed that the one aim of the company now is to convert everything into cash. Prices are utterly demoralized, we are informed. It is intimated that the prospect of obtaining cash will cause the management to sell at less than cost. Repeated instances of this sort of thing have been brought to our notice. The company's competitors do not know where they stand, for the reason that prices are forever shifting.

Can the General Electric Company seriously contemplate remaining in business any length of time with this policy?

ANOTHER ELECTRO-MEDICAL FRAUD.

The Earth-Magneto.

Some weeks since, the editors of Electricity received a circular announcing "The Greatest of all Electrical Discoveries," the so-called "Earth-Magneto," which claims to be "purely scientific" and warranted to cure a lot of human diseases "in one night." The circular states that the appliance "stands by itself, unrelated to any electro-medical batteries or appliances the world has ever produced; has three separate and distinct electrical actions upon the body—galvanic, static, magnetic," and that "by the combination of these actions an effect is produced upon the body which cannot be produced by any other electrical appliance or medical machine in the world."

The circular concludes as follows:

"In order to prove the value of our invention we will do what no makers of electrical batteries or appliances have ever dared to do. We will prove the truth of our statements. We will deliver at your residence on three days' trial, FREE FROM ANY COST OR EXPENSE, one of the Earth-Magnetos with full directions for using."

Availing ourselves of this kind invitation, we sent for one of the instruments for investigation and in due time it was delivered. It is still in our office awaiting the orders of the Earth-Magneto Company of 61 East 12th street, New York, who are the promoters of the scheme.

Upon opening the package we found a very handsomely gotten-up mahogany box 8 inches long by 3⅝ inches wide and 5⅞ inches high, closed with a metal clasp. Opening the box we found the binding posts, etc., in nickel—the whole being very attractively arranged. There was a little switch by means of which the current could be turned on; there was a little compass and a mother-of-pearl push button by which to indicate whether the Earth-Magneto required recharging or not; there were two binding posts to which the electrodes were to be attached, and another one by which a third wire leading to the ground could be attached, and a very pretty nickel-plated permanent horseshoe magnet, worth ten or fifteen cents in the open market.

On the inside of the lid were the following

DIRECTIONS:

1. Open the box and take out the *Electrodes*.

2. Connect the *tips* on the ends of the cords to the Binding Posts.

Each Binding Post is marked respectively P, N and G, meaning Positive, Negative and Ground.

On the tips of each cord there is a corresponding letter, P, N and G.

Connect the tip marked P to the Binding Post marked P.
Connect the tip marked N " " " " N.
Connect the tip marked G " " " " G.

3. Turn the switch until the blade rests on the button marked ON.

4. Place the box on the floor or stand near the bed or couch.

Attach the long single wire attached to Binding Post marked G to either the gas fixture or water pipe, which substitutes a conductor to the ground.

In case of not having gas or water pipes in the house an additional wire will have to be run to the ground.

The Earth-Magneto is then ready for use.

Place the electrode marked P on the wrist.
Place the " " N " ankle.

Keep the electrodes on all night. In case of being used during the day, leave them on at least *ten hours*.

Always turn off the switch when not using the Earth-Magneto.

By pressing the pearl button, it will cause the hand on the dial to point in an opposite direction.

When the hand fails to show any movement or vibration upon pressing the button, the Earth-Magneto will then have to be re-charged. This can be done by sending the Earth-Magneto to the Laboratory of the Earth Magneto Co., where it will be re-charged at the cost price, which is One Dollar.

The Earth Magneto Co., 61 East 12th St., New York.

Our curiosity being aroused as to how the instrument operated we took off the bottom of the box so as to get at its internal mechanism. Nicely packed in excelsior, we found a cell of Mesco dry battery with two wires leading from one pole and three leading from the other, the accompanying cut representing diagrammatically these connections and their relations to the fixtures on the face of the instrument. It will be seen that the carbon and zinc elements are connected with the binding posts P and N through a switch which, when in the position marked ON, connects the electrodes, so that when the latter are applied according to directions the battery circuit is closed. There is also a second circuit, as shown, which may be closed by pressing the push-button marked K. In this latter circuit is a small electro-magnet, marked E M, so situated with regard to the little compass marked C that when this local circuit is closed the magnet being energized will deviate the compass needle.

The fifth wire runs from the zn. pole of the battery and is electrically connected through the permanent magnet and its armature to the binding post G by which an earth connection may be made. It will be perfectly evident from the diagram that this last connection can have no possible effect upon the battery current and is simply introduced for purposes of mystification. It will also be perfectly evident that this appliance, which is sold at $15, is nothing more nor less than a simple galvanic cell, attractively housed-in and given convenient connections. The Mesco cell, which is a good one, can be bought anywhere at retail for 35 cents, and anyone desiring to avail himself of the peculiar virtues of the Earth-Magneto can do so by investing 35 cents or half a dollar in any good galvanic cell, being sure of obtaining all of the results possible from the higher priced box and have $14.50 left over for charity.

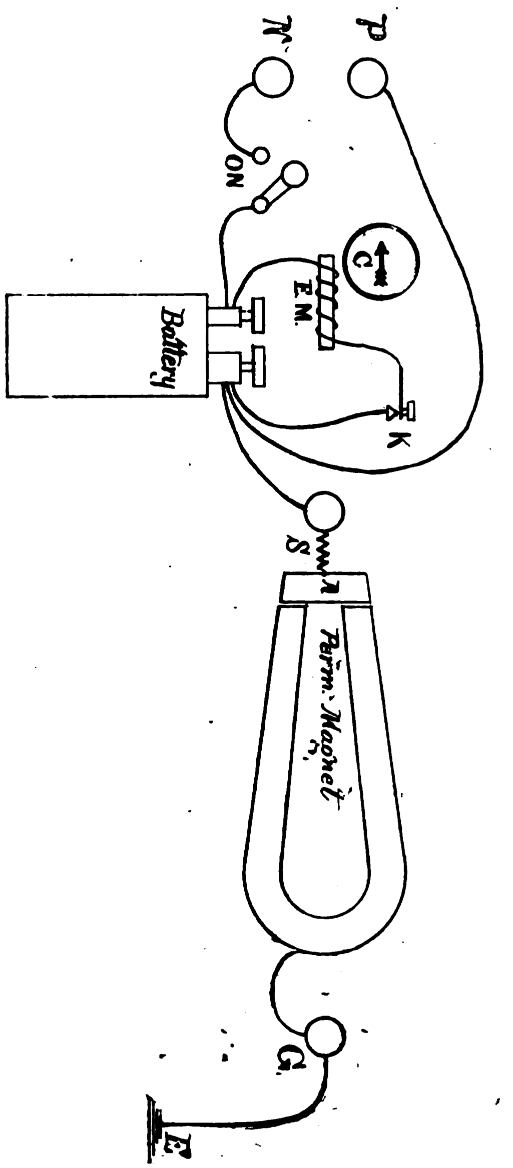

Diagram of Earth-Magneto Connections.

The fraud in this case, as in many others, lies in the gross misrepresentations made as to the merits claimed to be peculiar to the Earth-Magneto. The only peculiar thing about it is the name, which implies something which does not exist.

OPPORTUNITIES IN ELECTRICAL ENGINEERING.

BY A. A. ATKINSON.

Papers have frequently been published in the electrical journals deprecating the over-popularity of the electrical business in its various phases, claiming that the profession is already overcrowded, and upon this ground offering discouragement, sometimes in very strong terms, to the aspiring engineer. Among those in mind who have written in this strain are Mr. Henry Floy in the *Electrical World* a year ago, and Mr. James B. Cahoon in *Electric Power* quite recently. The latter, however, had special reference to factory courses.

It is only fair, of course, that an attempt be made to present the other side of the question. To this end this paper is written. For I cannot help seeing much encouragement in the outlook. Everything considered, I find electrical engineering in the broad acceptation of the words, if not on a flattering, at least on a very favorable basis as compared with other professions in regard to attractiveness, educational value and money return. In this it will be apparent that I am not at all Malthusiastic. I believe there is room and to spare.

Why should young men be discouraged from preparing themselves in a business and an electrical way to take charge of lighting stations and power plants, or any other practical applications, "because the growth of this business is not likely to be either sudden or rapid, or the opportunities offered particularly brilliant"? Should we say to the young man that has the aptitude and inclination for something else, "stay on the farm, or in the shop, or in the store at $25 or $30 a month, because if you go into the electrical business, for instance, you cannot get more than $40 to $60 a month"?

Is it any more of an argument for the opposition to state that "the electrical railways at present do not seem to appreciate the need of trained men, and most of them are satisfied with their horse railway superintendents who have picked up enough of electrical information to make the cars run whether a dividend is paid or money sunk"? The statement refutes itself, for it certifies to the very conditions that do demand the right kind of men. Let the men proper prepare themselves and prove their necessity to owners of electrical stock. The only reason that such a condition exists is on account of the paucity of the men who are able by training to bring the business out of its present status. These and similar positions are not open to the merely technical and high-priced theorists. They belong to those who have been advised in the course of their instruction of the exact conditions and practically prepared for what *is* not taught to expect big salaries and find or make positions to suit them. One of the things I also believe that often cast discredit upon the value of a college preparation is the lamentable failures of some technical graduates in attempting to manage practical electrical matters. And these conditions are not at all fanciful. Just such bad management is very easy to find in lighting and in power transmission in all too many places. Just these conditions are the argument for better men trained for the right thing.

I grant that there are too many who enter the profession with the purpose of "making their mark"—just the kind that are most apt to meet with failure. But as much can be said of any profession under the sun. I believe, also, that as the term "electrician" ought to be understood—not the electric bell and annunciator fiend—but few are needed. I grant again, that many applications are being refused by manufacturing firms—they, themselves, even failing and going out of business. Granted, that many classical graduates enter engineering schools to swell the ranks of that profession. All this admitted, I still contend that there are abundant opportunities for the pushing men who understand their business. Leaving out of consideration for the present the character of the positions offered in the various lines of professional and practical work, and looking only at the numbers studying for engineering in one or two instances, I know personally that in one or two institutions whose catalogues were quoted by Mr. Floy to show the great number of students of engineering, at least six to eight times as many are at the same time registered in the law departments alone, to say nothing of the medical and other professional departments, aside from the single professional schools in cities everywhere. Even if we should admit that only one-eighth as many men are required in the varied lines of electrical work as in the legal pursuits, still we are on favorable ground, with not the least reason to deprecate the number.

The value of the electrical engineer, and hence his success in the business undertaken, will depend on three things: namely, natural ability and aptitude of the individual, the character of his course of training, and the general view of the situation with which he leaves college. And this will lead us to consider the relative advantages of a purely technical and a practical education. Of course the third condition of success may result from either of these. But before undertaking either course the individual must satisfy himself by a study of his proclivities, so to speak, whether he has any ability and inclination in the direction of electrical engineering. He need not enter the profession for money or fame if he does not like to work out the course, practice and theory almost as well as to eat. Certainly, if he study only for the mental discipline and for a personal knowledge of the subject, this would not be true to the same extent. Or if his desires run toward business, law, medicine, sport or idleness, he will not succeed as an electrical engineer. But supposing that we have to deal with those only who should properly be engineers, so far as opportunties in life suggest, what kind of course shall be selected?

There has been a great deal said by way of discussion as to whether it will be most in accord with the fitness of things to educate the student along broad and general lines as a basis, and allow him afterwards to specialize in any direction he may wish, or to train him directly in the applications with which he must have to do, only giving him enough of the technicalities to serve as a basis for future work in case he should have the opportunity or inclination to pursue such a course. These may properly be classed as technical and as practical courses. In other words, I shall call technical that course of study in which are included a rigid course in higher mathematics, advanced mathematical physics, the higher mathematical theory of electricity and much mechanical engineering. These fill up most of the first three years of the course. The fourth is devoted to laboratory work in measurements, dynamo tests, engine tests, lectures on the telegraph, turbines, heat engines, and finally a thesis. The entrance to such a course generally requires of the student qualifications such as would admit him to the freshman classes in any literary or scientific course. On the other hand, I shall call practical that course of training in which the mathematics, physics, chemistry and mechanical training all look toward the engineer in practice, and which includes such parts as will be directly available for him in his everyday work, leaving the refinements for his own individual filling in afterwards, instead of teaching him the refinements and sending him out to fit some of it, if he can, to whatever application he may.

By way of further suggestion of the distinction from the purely technical, let me say that the practical course will include lectures and practice in wiring for the various kinds of distribution for lighting and power; calculations for alternating and direct current wiring under various conditions; the theory and application of electricity for railways, stationary power, lighting purposes, including the modern types of machines, direct, alternating and polyphase; designing and calculations for the winding of dynamos and motors; theory of steam with practical instruction in the care and operation of boilers and engines, dynamos and motors. His knowledge of lighting and power distribution will be enlarged by model plans and specifications drawn up by him to meet certain requirements in railway and central and isolated station work. More and more detail will be required in this as the student progresses until he is able to draw and specify for actual work. We could go on further in contrasting the two lines of study, but it will be apparent to almost any one stopping to give the matter any consideration what their distinctive features must be. The one a very general basis upon which any application may be built by a sort of second experimental training, while the other is intensely practical in all its aims and work. The one may develop the theorist, the electrical investigator, the electrician; but even here real practice in the bone labor of the profession would be of much benefit. The other will produce the artisan, the superintendent, the installing and consulting engineer. So that, assuming in both cases that the student has been apprised of the difficulties and necessities—in short, the real situation confronting him—in order that he may not go out with puffed or false ideas, each course prepares for a different line of work. Of course the one line may develop afterwards into the other.

(*To be continued.*)

Extraordinary Accumulator.

Our contemporary *L'Industrie Electrique* has actually unearthed from the columns of a French medical journal a brilliant accumulator, which it has added to its "Old Curiosity Shop.' But let this specimen speak for itself; it would be a pity to destroy the lucidity and scientific accuracy of the text:

"The new pamphlet concerning the accumulators is on sale at our offices, where our Paris readers can obtain it by sending one franc. Nothing has been neglected theoretically to explain clearly the object and advantages and to give readers the most detailed explanations about this new apparatus. Our experimental batteries have given such results that we have no hesitation in stating that we have ourselves been surprised at the quality of formation and duration. The accumulation increases, so to say, at a glance. One of the things which have most surprised the engineers who recently witnessed the erection of the accumulators is their immediate working, even before being charged with electricity. In effect, their sole manufacture contains the necessary materials for the production of electricity; this, notwithstanding all ancient theories, constitutes a powerful grate of reconstitution struggling against the losses of fluid. Nevertheless, we have desired to leave nothing to chance and reckon even for that loss which seems every day to become less." As the Brothers Griffiths would say, "Chose extraordinaire." We would recommend this masterpiece to the conductors of *Tid-Bits* or *Answers.—The Electrical Engineer* (London).

[We respectfully call Mr. Herbert Lloyd's attention to this, also.—ED.]

THE VARYING COST OF ELECTRICITY SUPPLY.†

BY ARTHUR WRIGHT.

After Mr. Ward Leonard's very clear exposition of the intimate relation of the load factor to the ~~cost~~ of supplying electricity, it may interest your readers to learn how this cost actually varies in practice according to the number of hours per day the consumers use their demand on the generating plant, and some of the results obtained at Brighton after two years' use of a sliding scale based on this relation.

That the main object of the adoption of the system at Brighton, viz., the improvement of the load factor, has been attained, is most readily seen from the curve (Fig. 1), where the upper line represents the various monthly load factors after the system has been in use for some considerable time, and the lower curve the load factor for the corresponding months before the system was introduced.

By monthly load factor I mean the ratio of the electricity actually registered by the consumers' meters to that which could have been sold had the greatest rate of consumption from the mains been maintained for 24 hours per day during the whole month.

In a rapidly-growing undertaking it is evidently difficult to ascertain the actual annual load factor, but the following figures will show in a striking manner how much better use is now made by the customers of the capital laid out in plant and mains than before the adoption of the system :

—	Uniform charge, 1892.	Sliding scale, 1894	Improvement since adoption of system.
*Annual sale of electricity per maximum kilowatt taken from the mains	711 units	888 units	Nearly 25 per cent.
Revenue derived per maximum kilowatt.	£20 14 0	£22 14 0	About 10 per cent., although average price obtained had fallen more than 12 per cent.

The true value of the fact that the sale of electricity has nearly quadrupled since the adoption of the system, while the maximum load observed at the generator station has only increased threefold, will be appreciated by the commercial station engineer when he remembers that, in stations of about the capacity of that at Brighton, that part of the annual expenditure which, in a given station, is independent of the sale of electricity, is generally 80 per cent. of the total expenditure.

Another object of the sliding scale has been attained, viz., to get the electric light introduced into basements, kitchens and other places, which, under the uniform system of charging, would be the last to be so lighted. This is shown by the fact that the average number of units consumed per lamp installed has increased from 19·5 to 22·45, or 15 per cent. This, I need hardly point out, is the reverse of the general experience elsewhere.

It will now be interesting to compare Mr. Leonard's table of the estimated proper charges for electricity on the sliding scale system to the figures which I have reason to expect will represent the cost of supplying it from the Brighton station in the present year, and with the present tariff, based on the use of one hour per day of the consumers' demands being charged at 7d., and the remainder at 3d. By consumers' demands I mean their greatest call made on the generating plant and mains, as measured by a maximum recording indicator:

Consumers' load factor.	Average hours use per day.	The probable cost of supplying electricity from the Brighton station in 1895.	The average charge at Brighton in 1895 per unit.	Mr. Ward Leonard's suggested tariff.
		d.	d.	d.
5	1·2	6	6·32	13
10	2·4	3·5	4·66	10
15	3·6	2·66	4·12	8
20	4·8	2·25	3·83	6½
30	7·2	1·83	3·56	5
50	12	1·5	3·33	3½
100	24	1·25	3·16	2

In order to arrive at the varying cost of supplying consumers who use their maximum demand on the plant for varying periods per day, it is necessary to find out how much the standing charges will amount to in the year; this, in a station having supplied electricity for more than two years, can be fairly accurately ascertained, as also can the approximate cost of supplying the electricity after everything has been put or placed in readiness to do so. The next item necessary to know is the sum of all the customers' demands in kilowatts the station with the existing plant and mains will safely supply while retaining a proper margin in reserve. The standing charges per day, divided by the total kilowatts severally demanded by all the consumers, will give the actual daily charge per kilowatt demanded that must be made to just cover the standing charges. This, in addition to the running cost per unit, gives the only possible basis for ascertaining the actual costs of producing electricity in accordance with the true Hopkinson principle.

In the year 1895 these figures for the Brighton station are estimated to work out at the rate of 6d. per day per kilowatt demanded, and 1d. for running costs.

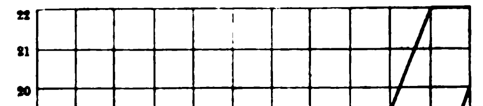

FIGURE 1.—IMPROVEMENT OF MONTHLY LOAD FACTOR.

While granting that the above is the true theoretical basis on which the charge for electricity should be made, I recognized in 1884 the fact that the more popular way of carrying out its principles would be to charge a high rate per unit consumed until each consumer's proper proportion of the standing charges had been met, and after that to make a considerable reduction, and I still think the highest admissible rate per unit should be maintained as long as it is necessary to cover the standing charges, plus the costs for running for that time. Until these costs are covered, obviously no profit can be made or reduction equitably allowed.

The estimated figures for Brighton in 1895 show that these costs will be about met by the consumers using their demand on the average one hour per day, and paying during that first hour 7d. per unit. After this time it can be fairly assumed that the cost of supplying each unit will not exceed 1d. As the highest allowable rate at Brighton is 7d. per unit, it follows that no profit can be made on consumers who only use their demand one hour per day, and that the actual loss incurred in having to supply those consumers who do not average one hour per day has to be unfairly met by charging the profitable consumers a greater rate of profit, and for this reason it has been decided that in 1895 all electricity consumed after the first hour is to be charged at the comparatively high rate of 3d. per unit. The fact that there can be a loss in supplying some short-hour consumers at 7d. per unit from a large station will be clear when it is recognized that if it were not for some 18 per cent. of the present consumers, and who only use the light at all about three months in the year, or less than one hour per day on the average, our present plant, station and feeders could go on supplying the increasing business for one or two more years, whereas, owing to their existence, it is necessary to put down fresh plant this summer for the ensuing winter's load, which could be entirely dispensed with for nine months in each of the next two years.

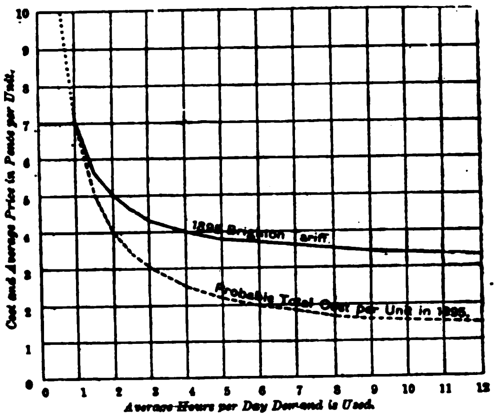

FIG. 2.

The curves in Fig. 2, illustrating the estimated cost and the present tariff, demonstrate how rapidly the cost of supplying electricity at Brighton in 1895 will diminish with the lengthened use of the plant, and how the 1895 charge actually varies with the lengthened use of the consumers' demand.

As there are only two real divisions in the items constituting the cost of supplying electricity, viz., standing and running cost, it may be well to remind the readers that it is therefore only necessary to have two rates of charge for the supply in order to obtain a perfectly equitable form of sliding scale of rebates, and that this involves hardly any more clerical work than does a uniform price system.

I am inclined to think that the fact that Brighton probably is this year the record station, both for lowest cost of production and greatest sale per inhabitant, is in no little way attributable to the "sweet simplicity" of the sliding scale used, and the adoption of Prof. Kennedy's suggested demand indicator.

Too much importance, in my opinion, cannot be attached to the superiority of a sytem giving rebates based on a consumer's actual use of the generating plant and mains, over one based on the more or less prolonged use of all the lamps installed. The former, if properly understood, actually encourages the general use of the electric light in a house, whereas the latter must necessarily have the reverse effect, and, moreover, is not based on any sound principle, as the preponderating standing charges are not altered in any way by the proportion of the total number of lamps in a house that remain unlighted.

---

† *The Electrician* (London).

* The meaning of this expression may perhaps be clearer if I explain that the figures given are arrived at by dividing the kilowatt hours sold by the greatest demand (in kilowatts) experienced at any moment. The improvement of the 1894 figure over that of the 1892 figure is an evidence that the average demand and the maximum demand have been brought more nearly to coincidence.

The following figures, obtained by means of the demand indicators, may be of service to central station engineers, and as they are derived from the records of nearly 1 000 customers, may be taken as fairly representative of any average town :

—	Less than one hour per day.	More than one and less than two hours.	More than two and less than three hours.	More than three hours.
Percentage of consumers who use their demand on the average.	13·6 %	38·6 %	32·1 %	15·8 %

Fromthis and the previous table of the 1895 Brighton tariff it will be seen that nearly 50 per cent. of the consumers will pay about 5d. per unit, or actually less tor electricity in 1895 than for the equivalent amount of Brighton gas, taking 1,000 feet of this as being equal to seven units of electricity.

UNDERWRITERS' RULES.*

BY WILLIAM A. ANTHONY.

A recent controversy in relation to inside wiring for incandescent lighting has suggested to me the importance of bringing out a full and free expression upon the subject from those whose experience gives them the best right to speak; and I venture to bring the matter before the Institute in the hope that it may provoke such an expression as may have some influence in determining the character of any changes in the rules for construction that may be proposed, or in fixing the interpretation to the rules now in force. The present rules are, of course, the result of a process of evolution, and I think every one will admit that the process has been one of progress. In early days of electric lighting, the desire to conceal the wires led to fishing them in between floor and ceiling and between plastered walls, as has been done with electric bell and burglar-alarm wires. Fires occurred, and were ascribed to the electric wires, sometimes rightfully, but no doubt sometimes wrongfully.

Insurance companies took up the matter, passed rules and appointed inspectors. Many of the rules were good, some were only an annoyance to the construction companies. Different boards adopted different rules, and often the inspector was a law unto himself.

Wishing to assist in securing uniformity, and feeling that electrical engineers, who have to do with the practical work of electrical installation, are best qualified to frame rules for electrical construction, the National Electric Light Association, in 1890, appointed a committee to take the matter in hand, and upon the report of this committee, in 1891, adopted a series of rules, which, with some amendments adopted at later meetings, may be assumed to represent fairly well the consensus of opinion among the electrical fraternity as to what constitutes a safe electrical installation.

Rules, substantially the same as those, have been adopted by the National Board and various local boards of fire underwriters, and are the recognized rules in force at the present time.

The object of all rules is, first, to secure a safe and permanent installation; second, to provide for the repair or renewal of conductors in case of failure. It may be said that from the standpoint of the insurance companies the first is the only object, but surely conductors so installed that they can be easily overhauled and replaced in case leakage is discovered are safer for the very reason that a fault is likely to be repaired before any serious damage has occurred.

When highly insulated wires, whose insulation resistance was measured in megohms per mile after immersion in water for weeks, came into use for electric lighting plants, it was natural to suppose that they could be put anywhere, and would last indefinitely. They were put in all sorts of inaccessible places—on the beams before floors were laid, in partitions before plastering, on the lath with iron staples to be covered with mortar. Some such circuits are no doubt in existence to-day as perfect in insulation as when first put up; but numberless cases of failures of insulation occurred, and experience shows that such a construction is entirely unreliable. Then came the interior conduit, which it was assumed would serve both as a mechanical protection and as an insulator, but it was found not to be entirely reliable in either capacity. It was not impervious to moisture, it was subject to damage by nails, saws and chisels. It was found necessary to prescribe that wire of the highest insulation should be used in it, and that it should not be drawn in until all danger from mechanical injury was passed. Then came the brass-armored conduit; but that was not nail proof. Now we have the iron armored conduit, and it remains to be seen whether this will fulfil all requirements.

It has come to be pretty well recognized that no mode of electrical construction is absolutely proof against failure at some point, and that form of construction is best which affords the smallest chance for injury or depreciation, and offers the greatest facilities for repair or renewal in case of failure. There has been a uniform progress in the direction of greater safety and better facilities for repair, from the time when wires were put anywhere, to be covered by floors or mortar, or built into brick walls, to the iron-armored conduit which is offered to-day. To be sure, the cost of the installation has advanced, and the iron-armored conduit presents difficulties when alternating currents are employed. To me it seems that the advantages gained are worth the cost, and the difficulty with alternating currents disappears if the two conductors are placed in one conduit. To this I can see no possible objection when the conduit is iron armored.

In view of the fact that we cannot be absolutely certain that failures in insulation will not occur in any given installation, it seems to me that the foundation principle of all rules for the placing of conductors should be accessibility. Further, no conductor should be placed where its position or its relation to other conductors in any part of its length is unknown. This means that raceways must be provided, into which conductors may be drawn and from which they may be removed at pleasure, such raceways to serve as adequate protection from mechanical injury; or the conductors must be placed in moldings which are themselves accessible, or they must be supported by cleats or insulators in plain sight.

I believe that past experience would warrant the adoption of a rule that would require the use, for concealed work in buildings of fire-proof construction, where conductors must be carried up steel columns, over steel floor beams, in brick partitions, or in plastered walls, of a raceway or conduit, equal in its ability to afford mechanical protection to that known as iron-armored conduit, so installed that conductors could be drawn in or out at any time.

And now a word as to the controversy that suggested this paper :

A conductor has been put upon the market which consists of a standard Habirshaw wire with its covering of rubber and braid, having woven upon it two additional coverings of extra heavy braid. This additional covering, which is tightly woven on, and from which the wire can no more be removed than from its original covering of rubber and braid, the maker, by an extraordinary stretch of language, calls a tube, and claims for it the advantages of the conduit tube prescribed in the insurance rules. It goes without saying that this wire affords no means of replacing a damaged conductor, and therefore has not that advantage of the conduit. As to mechanical protection, it certainly is not superior to the unarmored conduit, and it has not the advantage that the conductor can be left out until the danger of injury is passed. As to insulation against moisture, the added coverings do not improve it, the insulation being entirely due to the rubber covering which is inside of all the braids.

And yet I have just learned that the New York Board of Fire Underwriters, on March 20, passed the following resolution :

> *Resolved*, That the Superintendent be authorized, until further notice, to approve the use of the Attix tube and wire, when equal in quality and insulation to the samples submitted to this Board and tested, under the same conditions where tubing would be permitted ; provided that there is no splicing or tapping of the wire, but that its introduction shall be in all cases by the loop system ; that in new buildings, when necessary to carry it between floors and plastering, it shall be through holes bored in the beams, not less than two inches apart, a single conductor in each hole, out of the reach of nails ; and in old buildings, where necessary to carry it within the reach of nails, it shall be protected by some device from perforation ; and provided further that the wire and tube be carried intact into the cut-out boxes, and that in no case shall the outer covering be removed before introducing the core wire into the cut-out box.

It will be noticed that the wire is called a "tube and wire," when it is no more a tube and wire than the Habirshaw which forms its basis. The tests referred to show that, after immersion in water or being imbedded in plaster, the insulation resistance was twenty megohms per mile. But the Habirshaw wire, without the Attix covering, would have shown the same. What then is the propriety of confining the operation of this resolution to the Attix wire ? Why not permit the use of any good highly insulated wire under the same conditions ?

It seems to me that this resolution is one of those reversions to an ancestral type which we find in all evolutionary development, which is off the general line of progress, and which is destined soon to become extinct.

Triplicate Cables and Tricycles.

The following is an extract from an Australian paper recently to hand, from which it appears that in spite of the much vaunted triplicate cable route communication between Australasia and the rest of the world by the present system has its weak points. During the recent breakdown of the Australian land lines the following message was sent by the Postmaster-General of South Australia to the Postmaster-General of New South Wales : "Have sent an operator on an engine to remove the fault between William Creek and Peake, taking all messages, and sending them to Oodnadatta, and will return with all outward messages, being met at the Peake by tricycle from Oodnadatta." We presume that had the lines to Australia only been duplicated a bicycle would have answered the purpose !—*The Electrical Review* (London).

Electric Fusion of Metals.

A Swiss paper states that Mr. Nicolai Slavianoff, a Russian engineer, has devised a method of welding metals similar to that of Benardos, and which can with advantage be substituted for the latter when repairs to pieces of metal are necessary. According to Mr. Lohmann, of the firm of Messrs. Pintsch, Berlin, the working of the system is as follows: The object to be dealt with is connected to one of the poles of the source of electricity, and the metal bar to be used in effecting the repairs is connected to the other pole. The two electrodes are approached so as to cause an arc to occur. The metal bar soon begins to melt and the liquid metal is allowed to fall upon the parts to be repaired. The electrodes are, of course, gradually moved towards each other as the bar is fused so as to obtain an uninterrupted arc.

* A paper presented at the 96th Meeting of the American Institute of Electrical Engineers, New York and Chicago, April 17, 1895.

ARC CARBONS AND THE RATING OF ARC LAMPS.[*]

DISCUSSION.

Mr. Peck, of Brooklyn—The question of carbons is exceedingly interesting to me at present, as our company is in dispute with the authorities as to the candle power of our lamps versus the candle power of lamps furnished by a competing company. I had a letter from the inspector of gas asking me to have this Association give the companies a rating on lamps burning $\frac{7}{16}$, $\frac{1}{2}$ and $\frac{5}{8}$ carbons; and he also raised the question as to what is the proper size for a carbon to give a certain candle power at a given energy. I do not know whether this Association desires to put itself on record as giving standards for various sizes of carbons or not; but it seems to me the arrangement for a 2,000 candle-power light as given us at Washington really means nothing, as we find by experiment that we can get varying candle-power, using that amount of energy, by using different density of carbons and different size carbons. I would like to get information from some one here who has made experiments giving the candle-power by different size carbons, as to what the relative difference is in candle-power as governed by the size of the carbon?

Prof. Marks—In reply to Mr. Peck's question, I may say that the reference in the paper to current density partly answers his inquiry. It was stated there that within certain limits the candle-power varies inversely as the diameter of the carbon; that is in the assumption, of course, that the current be constant and the carbons be of the same batch and homogeneous.

You will remember that Mr. H. Nakano, now professor of electrical engineering in the University of Japan, deduced a law for the relation of efficiency of the carbon to diameter. His results confirmed the conclusion reached by Schreihage and indicate that the radiant efficiency is almost inversely proportional to the diameter.

Thus we see that as far as the operation of arc lamps at maximum efficiency is concerned, the limitations of life of the carbons would cut a very important figure with the central station man. It is well to remember that invariably a gain in light efficiency for a given grade of carbon is accompanied by a loss of longevity of the carbon points. You all know that ordinarily a soft carbon will give you a better light than a hard one of the same diameter. If you use a hard carbon of small diameter you may obtain the same efficiency as with a soft carbon of larger diameter. Again much depends upon the character of the basic material and the binder used in the manufacture of the pencils.

In the table which you have before you your attention has been called to the wide difference in the performance of chemical carbons operated under the same conditions. If you will refer to carbons numbers six and seven, which are made of lampblack, you will note that the latter, which has a molded structure, acts differently from the former, which is a squirted pencil, or one made by forcing the plastic mixture through a die. These carbons though made of the same material and carbonized in the same way, give quite different results in service, and I am quite sure if you decided that a $\frac{7}{16}$ inch pencil of the number seven type gave the best results as to candle-power for a given current and difference of potential, you would find that on substituting a pencil of the number six type a smaller diameter would be necessary to obtain the same light efficiency.

Again, though carbons of a certain diameter may be suitable for one purpose of illumination, change in the character of distribution of light desired may prove them to be less suitable for another. Even if the same current be used and the same watts expended in the lamp, it would be impossible to designate a particular size of carbon to meet all cases of distribution.

When we consider that variations are apt to creep in throughout the process of carbon making, we are brought face to face with another and graver obstacle in the way of considering a standard such as proposed. Variations in the character and size of grain of the pulverized crude material; in the nature of the binders; in the constituency of the mix; in the pressure in holding or squirting, as the case may be; in the duration and temperature of carbonization, etc.,—all these are more or less familiar to you and need no comment.

But after all why lay so much stress upon the diameter of the carbon or the candle-power of the arc? Does it make any difference to us whether an arc lamp gives 500 or 1,000 candle-power if the light is not available? As tersely stated by Prof. Houston the other day, what we want is a method of measuring illumination at the surface which is lighted and not at the source of illumination. And right here comes up another point bearing on the selection of a carbon for a special purpose. A carbon arc that may be well adapted to bringing out the colors of natural objects may fall somewhat short if the power of its illumination as applied to black and white be considered. For one purpose a carbon of particular structure, operated at a high voltage, may give best results, while for another a different structure and low voltage may be required. In fact, candle-power of an arc, per se, is in some respects a meaningless term and does not give a true expression of the value of the light.

As Dr. Edward L. Nichols has shown, "luminosity is the factor which we must take into account in seeking a complete expression for the efficiency of any source of illumination, and the method to be pursued in the determination of the luminosity must depend upon the use to which the light is to be applied. In a picture gallery, for instance, or upon the stage, the value of an illuminant increases with the temperature of the incandescent material out of all proportion to the candle-power, whereas candle-power affords an excellent measure of the light to be used in a reading room."

Thus it is clear that the quality of the light as distinguished from its candle-power must be carefully considered in the selection of a carbon and in the proper operation of a lamp intended for a particular kind of illumination. You are all familiar with the preponderance of the longer wave lengths, or those at the yellow end of the spectrum, in arcs operated on direct incandescent circuits. Contrasting these arcs with the constant current series arcs, the latter show a decided richness in the shorter wave lengths, or those at the violet end of the spectrum. In the former case cored carbons are used; in the latter, solid. The analysis of the core tells the story. If time permitted I should like to dwell on various phases of the subject other than those already taken up, but I trust what has already been said will cover the scope of Mr. Peck's inquiry.

(To be continued.)

LARGE ARC DYNAMOS.[*]

DISCUSSION.

The President called upon Mr. S. N. Hamill, who addressed the meeting on the subject of "Arc Dynamos." He said:

I have only a word to say, and that is that I naturally was very much interested in Mr. Black's paper. A man who sat for a number of years at the feet of such men as Prof. Brackett, of Princeton, and Mr. Brush, of Cleveland, ought to be able to write a pretty good paper. My interest in these large dynamos is purely from the standpoint of the manufacturer and seller. During the past year I think the Brush Company has built large arc dynamos from eight to ten thousand lights capacity. The inquiries concerning them do not come in from the new installation companies, but almost entirely from existing stations. This is natural, for the reason that nearly all our large electric light stations are quite centrally located in the large cities of the country, where real estate is expensive, where the business is growing, and where it is a question either of going away further from the center of the cities or purchasing additional real estate at great expense in order to increase the capacity or to exchange the small dynamos for larger ones. I have in my mind, for instance, one of the largest and best managed local companies in the country where they have two large stations quite near enough to each other in the center of the large city, stations that have been in existence thirteen to fourteen years, where last year they had 2,000 lights capacity and arc dynamos ranging from old ten-lighters up to sixty-lighters, using a tremendous amount of shafting and belting, and naturally they were inefficient dynamos. This company exchanged all their old dynamos, small and large, for a complete new outfit of twelve or thirteen large dynamos, and by so doing they obtained a great deal of space in existing stations for increasing their business without going to the expense of enlarging their areas. I have in mind another station where they had almost exclusively fifty to sixty light arc dynamos with a capacity of about 2,000 arc lights. This station changed from fifty to sixty light dynamos to 125-light dynamos, and saved a large amount of floor space and increased the efficiency of their machines, which is a very telling point. The field at the present time, as far as manufacturers are concerned, is almost entirely along the line of exchanges from the small to the large units, and there is very little profit in it for the manufacturer.

Prof. Thomson—I have been quite interested in listening to the paper, as I consider it a very true exposition of some points connected with the operation and design of arc dynamos. The development of the arc dynamo, it is true, has been somewhat backward; still I do recollect that machines were built far back in the early days which were capable of giving a curve similar to that which has been shown, a characteristic curve, but they were disadvantageous from the very large armature reaction, the size of the armature, the amount of wire, and the dead resistance of the wire used in the construction. The question as to whether open coil dynamos or closed coil dynamos are the best for arc lighting has been fully discussed in the literature of the subject for a long time. Considered purely as an electrical affair without reference to the practical uses, there can be no question but that the closed circuit dynamo is the better electrical structure. I say considering it simply as a dynamo; but when you come to use that dynamo in the conditions of practice there may be considerations which will modify that conclusion. I am really

---

[*] A paper read before the N. E. L. A. at Cleveland by L. B. Marks.

[*] Paper read by C. N. Black before the N. E. L. A. at Cleveland.

sorry that Mr. Wood, the champion of the closed circuit dynamo, is not here. We might have had a discussion bringing out the strong points on the other side. When I first entered the business my object was to get that kind of a machine which, put into ordinary hands, men of no experience with machines of the kind, could be run successfully and keep the lights going, and the object was to reduce to the utmost simplicity those parts which were subject to wear and which could be injured by bad handling. Therefore the commutator was reduced to very few parts and it was constructed so that if anything happened to it, to injure the segments, it was a simple thing to take off the segments and put on others. That could not be done if the commutator contained from one to two hundred segments. In that case it would mean that you would have to take out the whole commutator and lay it aside and get a new one, and make all the connections before you could start the machine. In the early history of dynamos we did not have experienced men to handle them. The dynamos were not put in stations with a dynamo tender of experience in charge. They were in charge of an engineer, who might know how to run his engine but knew nothing of the dynamo, and who had a superstitious idea that that was a thing which he must not touch. We have had enough cases of this kind arise. In one case the brushes on the dynamo would not rest on the commutator and we had a communication that something was the matter with the machine and we were to send the best expert we had right along. The moment we go into a new field we have to educate men to understand how to handle the new structure on account of its peculiarities. The fact that an arc dynamo, when it has its circuit interrupted, will not give the rise of voltage which the continuous dynamo gives has been known for a long time.

The point of flashing was admirably brought out in the paper. The moment you begin to open the circuit of a machine it is the same thing as overloading, that is, you are putting in a high resistance. The arc follows, amounts to so many arcs put in resistance. The potential, on account of the self-induction of the wire coils, at once begins to rise with the attempt to hold a diminished current. If at that moment the commutator, owing to its arrangement and construction, flashes over, arcs across from one side to another, you have removed the E. M. F. of the armature, and if the machine, as is often the case, has a copper band in the field poles, then we have an inductive circuit parallel with the field winding which takes out the inductive E. M. F. from the field coils, and it is not surprising that there should not be a great rise in a case of this kind. Long ago the natural practice was that when we ruptured the circuit of the open coil the flashing did not extend any great distance, but it was a well-known fact if you had a close coil the circuit of flash was much longer.

Mr. Townley—There is one phase of the question which I should be glad to have the opportunity of stating to the members. It has been my fortune to be in a position where the demand for large units for lighting has been heard from very quickly, and I can confirm Mr. Hamill in his statement that the pressure is very strong for large units for arc lighting. The reason why arc lighting machines seem to have been made small for so long a time is possibly not easy to answer, but it may be found in the fact that until very recent times it has been very difficult to insulate for the corresponding potentials. Looking at the problem of furnishing a large number of arc lights to a community, from one of our central stations, it is evident that if the conditions were not so severe as to render it otherwise it would be advisable not only to use a machine as large as 100 or 125 lights, but in fact machines of larger capacity and insulation, of one, two or three thousand arc lights. We should manifestly have, if possible, units of larger capacity than 125 lights, and when we get down to 60, 75 or 80 lights the objections are greater. In some cases there have been established stations of units of two, three or four hundred lights in one machine, this being done, however, by the use of constant potential in place of constant current machinery. This is necessitated, apparently, by the use of alternating currents, and it possibly has not been brought into more general use on account of the lack of success in starting and operating the alternating current arc lamps. At the present time, however, that objection can hardly be said to exist, and the fact that they are now operating stations of considerable size using this system, practically demonstrated the success of it and is worthy of consideration. Of course with the introduction of the alternating lamp, and the ability to run power from apparatus of this character, there is a great point to be gained in large cities, particularly where underground work is necessary, when we can supply incandescent and arc lighting and power, in fact all classes of service, from the same unit; and if that unit be a large unit, we can take advantage of the best economy in steam practice and the higher efficiency in dynamo construction. It seems to me that the development is bound to be in future along the lines of these larger units and that as the electric lighting public, men who have their money and interests involved in this industry, come to know that this system is a profitable one, successful commercially and acceptable to municipalities, it is bound to be a very prominent factor in our interests hereafter.

Cathode Rays.

At a recent meeting of the Société Francaise de Physique M. de Kowalski read a paper on the conditions necessary for the production of cathode rays. Starting from an experiment due to Goldstein, in which in a vacuum tube having a constriction at its middle it is found that the cathode rays are formed not only at the negative electrode, but also at the constriction, the author has made several experiments, using tubes of different shapes. He finds that wherever the electric discharge is sufficiently dense, as near the electrodes, or in a capillary tube joining the two parts of a vacuum tube, cathode rays are produced. These rays are propagated in straight lines, are deviated by a magnet, and produce a bright patch where they strike the glass. The author has also succeeded in obtaining cathode rays in a tube without electrodes. This tube had somewhat the shape of an elongated hour-glass, and was placed alongside a discharger, through which "Tesla currents" were passed. Under these circumstances cathode rays are produced at either end of the capillary tube forming the central part of the vacuum tube. M. de Kowalski concludes from his experiments: (1) that the production of cathode rays is not connected with the disintegration of metallic electrodes in a rarefied gas; (2) that these rays are produced wherever the density of the discharge is sufficiently great; (3) that the direction of the rays is the same as that of the lines of flow of the current at the point where they are produced, and that they are propagated in the opposite direction to that in which positive electricity is supposed to flow.

Some years ago Prof. Ayrton pointed out that in the lead cell, "in consequence of its being slightly warmer than the air during charging and discharging, there is a loss of energy from radiation and convection equal to about 17 per cent. of the energy put into the cell."

COMMUNICATIONS.

THE TWO-PHASE SYSTEM.

To the Editor of ELECTRICITY.

DEAR SIR: In an editorial in your issue of April 10 you say in reference to the new Westinghouse shops: "Aside from all this, these new works undoubtedly constitute the most complete electrical shops in the world of any kind, and the only ones using the two-phase currents for all operations." As to the first part of this statement it is a matter of individual judgment and we have no comment to make; but we are certainly astonished at the latter part, as a reference to your own files would prove its inaccuracy. Our shops have long been operated by two-phase currents, and entirely so. There is not even a temporary use of direct current for elevators and cranes. The whole work is done by two-phase currents. Neither is our apparatus of such peculiar design that it can be operated only at an abnormally low frequency. All the apparatus in our shop is supplied from the central station of the town by a generator using the standard frequency of 16,000 alternations. It is not necessary for us to limit ourselves, therefore, saying that our apparatus could also be used at Niagara. It can be used in connection with any central station and is being used in connection with many. We are surprised above all that you should undertake to decide the legal question as to the right to use two or three-phase currents for transmission purposes. Surely an anti-monopoly journal need not start in to create a monopoly in advance of the decision of the courts. Had these statements appeared in a journal known to be biased or to be affected editorially by its advertising columns we should have passed them over in silence as of no importance. In the militant advocate of fair trade, however, they carry weight. We trust that, your attention having been called to their erroneous nature, in your usual spirit of fairness you will rectify them. JOHN F. KELLY.

Stanley Electric Manufacturing Co., Pittsfield, Mass.

[We thank Mr. Kelly for correcting us in making too sweeping a statement, as the Westinghouse shops are not "the only ones using the two-phase currents for all operations."

More than a year ago ELECTRICITY published a comprehensive write-up showing the application of the S. K. C. two-phase system in the Stanley works at Pittsfield, which, we believe, was the first extensive installation, and which has worked with perfect success. We regret the overstatement, which was purely inadvertent.

In regard to our remarks as to the legal questions involved, we made no attempt to anticipate the decisions of the courts, discussing merely the Westinghouse and Monocyclic systems, as a careful reading will show. We stated, what we knew to be a fact, that the G. E. people had *acknowledged* their Monocyclic system to be an infringement of the Tesla patents.]

THE ELECTROPOISE.

To the Editor of ELECTRICITY.

DEAR SIR: Your recent attacks on electro-medical frauds have been very interesting to me, and I congratulate you on your success in showing up the periodicals which are willing to lend themselves to the furtherance of such schemes. In your issue of April 10 you print in large type the names of three religious journals which deserve credit. Among these is the *Outlook*, which you state withdrew the advertisement after your expose. Now I have before me a copy of the *Outlook*, bearing date of March 30, 1895, in which is a one-third page advertisement of the Electropoise. If I am not mistaken, I have also a still later copy at my home which also contains this advertisement. This is certainly later than your exposition of the fraud, and I dislike to see any injustice done to the *Outlook*, so I put you in possession of these facts that you may make a proper apology for giving the *Outlook* a place with the sheep when it belongs with the goats. Yours very truly, CALVIN P. H. VARY.

Banking House of Vary & Sleight, Newark, N. Y.

[We do not scan the advertising pages of the *Outlook* every week, confining our attention chiefly to the comments of the Rev. Dr. Lyman Abbott. Our statement that the paper had discontinued the advertisement of the Electropoise was made upon the supposition that Mr. Howland, the publisher of the *Outlook*, told us the truth when he stated, after the publication of ELECTRICITY's first exposé of the Electropoise, that while he was personally inclined to believe in the Electropoise, he wanted to hold the advertising department of the *Outlook* up to the highest standard, and should not accept the advertisement again. We regret to know that the theory of Christianity as preached in the pulpit of Plymouth Church, and afterwards through the columns of the *Outlook*, is not practised in the business department of that journal.

For a journal to assist in the promotion of a gross swindle, and to accept the money of the swindler as a consideration for that assistance, precludes the possibility of such journal, or the clergyman conducting it, doing successful missionary work among those who know the facts, and there are thousands.

We may add that we have the names and addresses of six members of Plymouth congregation who state that they were humbugged out of the price of an Electropoise through seeing it advertised in the *Outlook* some months ago. —ED.]

Heat Imparted by the Electric Light.

A French contemporary, the *Moniteur Industriel*, states that Capt. Exler, of the Austrian army, has found that a 16 C. P. incandescent lamp gives off a maximum temperature of 94 degs. C., and a lamp of 25 C. P. 101 degs. C. Two lamps placed in a wooden receptacle yielded a temperature of 215 degs. C., decomposing explosives such as gunpowder, ecrasite, pyroxyline, etc., but without exploding them. The receptacle having been filled with water, the latter became in a state of ebullition at the end of fifteen minutes. In case of the breakage of the lamps, the powder and pyroxyline do not ignite, but this is not the case if an explosive gaseous mixture is present. The captain points out that too many precautions cannot be taken, notwithstanding the use of electric lamps, which, whilst reducing the danger of an explosion, do not completely remove that danger. From the experiments made, it is held that the solution of the problem does not in any way lie in the employment of a double bulb with an intermediate closed space filled with air or water. The heating of the water would be avoided by the use of a reservoir having double communication with the external envelope, an arrangement by which would be established a continuous current, and which would allow of the cooling of the water. But in order that the latter may be sufficient, the volume of water necessary would render the arrangement heavy and cumbersome, and the method is consequently not practical. A rational solution for the lighting of places where gas or explosive materials are present seems to be, according to the captain, simply in arranging the incandescent lamp in a glass cylinder closed at both ends by means of metallic cloth; the current of air would freshen the bulb, and the slight heating of the air passing out would not be detrimental. In case of the breakage of the bulb, the combustion of the filament would produce at most only a small internal explosion, as in miners' lamps, incapable of transmitting fire outside.—*Electrical Engineer* (London).

Prof. J. C. Bose, of Calcutta, has just succeeded, says the *Indian Engineer*, in reproducing signals in the form of light, sound and other phenomena without any connection between the transmitting and receiving stations; even solid walls have not interposed any obstacle to the ransmission of these signals.

Personal.

Mr. R. L. Weithas, who has so long and efficiently arranged the advertising pages of the *Electrical World*, has severed his connection with that journal. Mr. W. has acquired an interest in Burrelle's Press Clipping Bureau, Western Union Building, of which he will become secretary and manager. What is the *Electrical World's* loss will be Burrelle's gain, and we congratulate the latter upon the acquisition of the services of a gentleman at once so capable and so well known to the newspaper fraternity.

The "Street Railway Gazette" Sold to Mr. W. J. Johnston.

The following announcement, which is official, will come in the nature of a surprise to many of our readers:

The *Street Railway Gazette*, with all its assets, has been purchased by Mr. W. J. Johnston and will hereafter be issued each week from Mr. Johnston's office, 253 Broadway, New York. Mr. Clarence E. Stump, general manager of the paper, and Mr. J. W. Dickerson, the editor, will still be connected with it. The *Gazette* is the only weekly street railway journal in the world. It was established in 1886 and for the first six years was published monthly, but since 1892 has been issued every week. As a result of the change in ownership it is announced that some modifications will be made in the *Gazette*. The size of the page will be slightly reduced and the number of pages considerably increased. The reading articles will be by practical men for practical men and while technically accurate will be written in plain and simple language. More illustrations will be used than formerly, and the effort will be to make the paper in every way a worthy representative of the activity and enterprise and progressiveness characteristic of the street railway business.

SOCIETY NEWS.

American Institute of Electrical Engineers.

The regular monthly meeting of Council was held at 26 Cortlandt street, New York, April 17.

The following associate members were elected:

James C. T. Baldwin, Chicago, Ill.; Francis Elliott Cabot, East Milton, Mass.; S. B. Fortenbaugh, Madison, Wis.; W. C. Harris, Jr., Birmingham, Ala.; G. H. Jones, Iquique, Chili; Charles LeBlanc, Paris, France; Wm. E. Lindsay, East St. Louis, Ill.; Paul N. Nunn, Telluride, Col.; George Herbert Winslow, Pittsburg, Pa.

The following associate members were transferred to full membership:

Albert Schmid, Pittsburg, Pa.; Omenzo G. Dodge, Washington, D. C.; Charles Ashley Carus-Wilson, Montreal, Can.; James A. Lighthipe, San Francisco, Cal.; Arthur Edward Childs, Philadelphia, Pa.; John Waring, Ovid, N. Y.; W. L. Puffer, Boston, Mass.; H. J. Ryan, Ithaca, N. Y.

Mr. George A. Hamilton was elected treasurer for the unexpired term of the late treasurer, Mr. George M. Phelps.

At the meeting of the Institute in the evening President Houston officially announced the death of Treasurer Phelps with fitting remarks regarding his services in behalf of the Institute.

Mr. W. J. Hammer, chairman of the special committee appointed by the Council, made the following report which was accepted with a rising vote:

The Council of the American Institute of Electrical Engineers, desiring to express its sense of the loss to the Institute in the death of George May Phelps, at its meeting held Wednesday afternoon, April 17, 1895, at the Institute headquarters, appointed a special committee of three to draft suitable resolutions, which the undersigned as committee respectfully present herewith:

Resolved, That in the death of George May Phelps the Council has suffered the loss of an energetic, faithful and capable member and the Institute a most efficient officer: one who was constantly striving to uphold the standard of its work, one who was ever watchful of its welfare. In his disinterested efforts to serve the Institute he brought to bear upon its deliberations his keen perceptions, intellectual ability and eminent force of character.

Resolved, That a copy of this resolution be suitably engrossed and framed and presented to Mrs. George W. Graham, his daughter and the sole surviving member of his family.

WILLIAM J. HAMMER.
JAMES HAMBLET.
RALPH W. POPE.

A paper by Prof. E. J. Houston and Mr. A. E. Kennelly, upon "Resonance in Alternating Current Lines," was read by Mr. Kennelly and discussed by Mr. Bradley, Dr. M. I. Pupin and Prof. A. G. Webster.

A paper was also read by Prof. W. A. Anthony on "Underwriters' Rules," which was discussed by Messrs. Hammer, Leonard, Woodbury, Jenks, Holmes, Mailloux, Ayers and Hamblet. A communication from Mr. Fremont Wilson was also read.

On account of the lateness of the hour the final discussion of the paper was laid over until next meeting.

The Brooklyn Electrical Society Outing.

The first anniversary dinner and "Trolley Ho" party of the Brooklyn Electrical Society will be held on Thursday evening, April 25, at the Albemarle Hotel, Coney Island. The large "Trolley Ho" car of the Coney Island and Brooklyn Railroad has been chartered for the occasion and will leave the power house at Smith and Ninth streets, Brooklyn, at 7:45 P. M. The car will be handsomely decorated and the one hundred and odd members will show the residents along the road what lusty lungs the one-year old organization has developed in its brief existence.

Artificial Diamonds Manufactured by an Electrical Process.

An interesting lecture was delivered Tuesday evening, April 16, before the members of the Brooklyn Electrical Society, by Edward Durant, on "Electricity as Applied to the Manufacture of Artificial Diamonds and Rubies, Aluminum and Electric Gas."

Mr. Durant gave several practical illustrations and experiments, among which were the manufacturing of artificial diamonds, as follows: Common granulated sugar was put in a jar, on which sulphuric acid was poured. From this a pure carbon arose, and that, with the use of an electric current of great heat, gave a crystallized carbon. This carbon proved to be the diamonds.

The next experiment was that of making "Acetylene" gas.

Columbia College Lectures.

Prof. Lieber gave a very comprehensive review of the development of the electric railway in his lecture on that subject at Columbia College on Thursday evening last. In considering the efforts made in storage battery traction, he gave it as his opinion that this method is not at all practicable. The Love conduit is giving satisfactory service in Washington, D. C., and it was the belief of the lecturer that this form of traction would shortly be perfected. In the application of electric power to high speed passenger service on steam roads Prof. Lieber was positive that the electric motor will soon supplant the steam locomotive.

General News.

What is Going on in the Electrical World.

Montpelier, Ohio.—This town has voted to put in waterworks and an electric light plant.

Tiffin, O.—The sale of the Tiffin and Fostoria and Tiffin electric roads, advertised for the 15th inst., was postponed.

Louisville, Ky.—The Dinkey line, connecting Louisville with NewAlbany and Jeffersonville, is to be converted into an electric system.

Albany, N. Y.—F. R. Barnes has asked the common council for permission to construct an electric railway line in this city.

Madison, Wis.—D. C. Jackson and C. M. Conradson have recently brought out a line of electric motors and dynamos and are meeting with success.

Windom, Minn.—This place will soon have a special election for the purpose of voting on issuing bonds for a system of waterworks, sewerage and electric light.

Hackensack, N. J.—The Hackensack Gas Company has purchased the Edison electric lighting plant, and will now control both the gas and electric lighting.

South Bend, Ind.—The Interstate Power Company has asked the council for permission to erect poles and wires for electric lighting, heating and power.

Cottage City, Mass.—The Cottage City street railway has been sold to a syndicate of which Josiah Quincy, of Boston, is president, and will be equipped with electricity.

Arlington, Mass.—The electric lighting committee are obtaining estimates on a municipal plant. Many of the business men favor buying the plant of the Somerville Company.

South Haven, Mass.—This town is to have an electric lighting plant, and a committee has been appointed to advertise for bids; $10,000 has been appropriated. Mr. H. Zeedyk is a member of the committee.

Newcastle, Wyo.—The city council is making preparations to put in an electric light plant here. Plans are about completed and it is expected that work on the plant will be begun in a short time.

Saginaw, Mich.—If the Legislature gives the authority to our city council to expend $100,000 in erecting an electric lighting plant, this city will soon enjoy the municipal system of public lighting.

Connersville, Ind.—The city council has decided to put in a municipal electric light plant to cost from $12,000 to $20,000. The council refused to submit the matter to a vote of the people.

Baraboo, Wis.—Eastern capitalists have presented a petition to the council asking for a franchise to construct an electric railway from Devil's Lake to Kilbourn City, a distance of seventeen miles.

Auburn, N. Y.—The city attorney has been directed to prepare an act to be sent to the Legislature authorizing this city to build and control an electric lighting plant, if a majority of the electors so vote.

Enterprise, Miss.—S. H. Gelheman, of Springfield, Ill., and L. B. Bradley have applied to the mayor and board of aldermen for a franchise to erect an electric light plant and for an electric street railroad franchise.

Mound City, Mo.—The proposition granting the Mound City Electric Light and Power Company a franchise for twenty years for an electric light plant in Mound City has been voted upon and carried almost unanimously.

Versailles, Ky.—There is now prospect of Versailles being lighted by electricity again soon. The city council have approved specifications for their proposed plant and have notified several electric manufacturers to submit bids.

Brazil, Ind.—The representative of a Chicago house has been in the city recently conferring with the management of several of our coal companies with a view to putting in electric power for operating the machines in the mines.

Wilmington, Del.—Nathan Snellenburg & Co., of Philadelphia, are having plans made for a handsome store in Wilmington. It will be equipped for electric lighting and with all approved appliances, elevator, freight lift, etc.

Savannah, Ga.—Judge Speer of the United States Court has placed the City and Suburban Railway of Savannah in the hands of Col. John Screvin as receiver. The road includes seventeen miles of electric railway in and outside the city.

Des Moines, Iowa.—Financial and real estate men here are planning for an electric railway line to Indianola. It is said that articles of incorporation of a company to build the road will soon be filed. The line would be eighteen miles long.

Bellefontaine, O.—The new city council has decided to issue fifteen $1,000 bonds for the purpose of lighting the city with electricity, the bonds having been voted at the late election. The work of putting in the plant will be speedily pushed.

St. Louis, Mo.—The Kirkwood Electric Railway Company has asked the court for permission to increase its capital stock to $300,000, and will issue bonds for that amount, the proceeds of which will be used for the construction of the proposed railway.

Lockport, N. Y.—The common council ha voted at last to accept the proposition made by Charles A. Johnson, of New York, to finish the construction of the electric street railway here. Concessions were made that did away with all features objectionable to either side.

Milwaukee, Wis.—The contract for the heating and electric light plant for the new city hall building has been awarded to the Western Electric Company of Chicago, whose bid was $25,408. The Cassidy & Son Manufacturing Company, of New York, will furnish the gas and electric light fixtures.

West Chester, Pa.—The contractor has started work on the eleven miles of trolley road between Cobb's Creek and Castle Rock. The road is being built by the West Chester and Philadelphia Turnpike Company. The line when completed will give West Chester a direct trolley line to Philadelphia.

Indianapolis, Ind.—Arrangements are in progress here for the organization of a new electric light company whose field will be the suburbs outside of the city lines requiring wires to be placed underground. Leon O. Bailey is the attorney for the company, which includes several local capitalists.

Omaha, Neb.—The proposed electric railroad between Fremont and this city will require an investment of $300,000, and at Col. J. H. Pratt's suggestion, a thorough canvass will be made in Omaha and Fremont and along the route to ascertain what amount can be raised from the friends of the scheme.

Richmond, Va.—The sub-committee on streets have received propositions from Capt. Pizzini and from Martin & Pendleton, of Richmond, and E. A. Catlin, representing New York parties, for building an electric railway on Broad street. Mr. Catlin estimates that the work he proposes will cost $400,000.

Marietta, Ga.—The entire plant and franchise of the Marietta Electric Light Company are to be sold under foreclosure proceedings on May 7, prox. The plant consists of a 35 light Brush arc machine, a 600 light incandescent machine, a 70 H. P. high speed Ball engine, a 30 H. P. high speed Ball engine and three 35 H. P. boilers.

Baltimore, Md.—The Baltimore and Ohio Railroad Company have decided to put the Belt Line Railroad to use as soon as the overhead electric work is completed in the tunnel. It will probably be two months before the electric locomotives to be eventually used in the tunnel to push the trains will be ready for service.

Hornellsville, N. Y.—There is a plan on foot here which may result in giving Hornellsville cheap electric power for manufacturing purposes. The scheme is to construct a dam across Canacadea Creek, between this city and Almond, by which 1,000 horse power could be easily produced to be transformed into electrical power.

Auburn, Me.—The new line of electric road to be built from East Auburn to Turner will be seven miles long and will start in Auburn from a point near the terminus of the Lewiston and Auburn Horse Railroad Company. The capital stock of the company is $50,000. F. W. Dana, H. W. True and N. Q. Pope are the prime movers.

Buffalo, N. Y.—The growth of street railroad traffic in this city in five years has been remarkable. In 1889 the company carried some 14,000,000 people. In the year ending December 31, 1894, 42,506,603 passengers rode on the cars of the Buffalo railways, an increase of 300 per cent. Electricity is now the motive power for the entire system.

Exeter, N. H.—At a meeting of the incorporators of the Exeter street railway last week an option on the charter was unanimously voted to G. Ward Cook, of Haverhill, until July 1 next. If by that time a beginning has been made or satisfactory assurance of immediate construction given, the incorporators will give Mr. Cook control of the franchise.

McKeesport, Pa.—Application has been made for a charter for the Monongahela Traction Company to operate an electric railway from Pittsburg to Greensburg via McKeesport. The company will be capitalized at $1,000,000, although the charter only applies for $5,000 capital. Allen D. Wood, John F. Davitt, L. G. Woods, Richard Fickling and J. Harper Adams are the applicants for the charter.

Ottawa, Ont.—The International Radial Railway Company will make application at the next session of the Dominion Parliament for incorporation. The company proposes to build electric railway lines in various parts of Western Ontario; to operate barges and steamships between terminal points of the railway on lakes Erie and Ontario and ports of the United States; to acquire or enter into other arrangements with electric railways now in operation and with the Canadian Pacific Railway and the Canada Southern Railway or New York Central Railway, and to build works to generate electrical energy for heat, light, power and other purposes, and to distribute the same.

Athens, Ga.—The Athens Railway Company have made arrangements to remove the plant used in operating their electric railway to Mitchell's Bridge on the Oconee River where they have purchased a water power which can be developed to give 800 H. P. This will be employed in operating a generating plant capable of furnishing motive power for their road and supplying all the electricity needed in the city for lighting and manufacturing purposes.

Brooklyn, N. Y.—The new trolley regulations for Brooklyn make it necessary to have an indicator in every car in full view of the passengers so that the speed at which the car is running at any moment may be known; they fix the rate of speed at six miles within a mile and a half of the city hall, and require safety fenders to be attached to the front platform of every car. Fourteen inspectors will be appointed to see that the law is enforced.

Knoxville, Tenn.—The city council has agreed upon a bill to be presented to the Legislature giving Knoxville the right to establish and maintain an electric light plant. Investigations have lately been made of the water powers attainable, and if the bill is passed it is probable that the plant will be erected at some distance from the city at the point selected as the best for the purpose of producing electricity by water power and transmitting it to the city.

Ukia City, Cal.—The *Democrat* says: "While at Cloverdale last week we learned that a company of capitalists have appropriated the water power along Sulphur Creek, near that town, and intend putting in a dam with the view of obtaining sufficient power to generate electricity for the entire county of Sonoma. The company has already leased a site for the dam and will commence operations at an early date."

Columbia, Pa.—A new electric railway is projected to extend from Columbia to Mt. Joy by way of Ironville. The section between Columbia and Ironville is to be finished by the middle of July. The officers of the company, all Philadelphians, are as follows: President, James L. Hetherington; treasurer, Walter N. Boyer; directors, William A. Brazell, Casper Becker, Benjamin I. Wagner, Robert Armstrong, Col. F. P. Boyer and Col. George W. Bratton.

New Orleans, La.—The city council has passed the ordinance granting to E. M. Hudson and others the right to construct, operate and maintain a system of electric street car lines in this city, embraced in five franchises and reaching out to all points in the city.—The ordinance to authorize the Orleans Street Railroad Company to build an electric power-house in the square bounded by Decatur, North Peters, Marigny and Elysian Fields streets has been favorably reported to the council.

Niles, Mich.—The Interstate Power Company of Michigan and Indiana has been formally organized. Fred E. Lee, of Dowagiac, is president; R. D. Dix, Berrian Springs, vice-president; J. O. Becraft, Dowagiac, secretary and treasurer. An immense dam will be built directly on the State line to transmit power for an electric line from South Bend to Niles, and probably through Berrian Springs to St. Joseph. The company will also manufacture electrical supplies and supply power to others for manufacturing purposes.

Tampa, Fla.—The Consumers' Electric Light and Street Railway Company have purchased a water site on the Hillsborough River known as the Herndon Shoals and intend to build a rock dam there. They will erect a power-house at the shoals and place their new machinery in it. They expect to develop sufficient water power at that point to operate their dynamos at all seasons, and will furnish electricity for the operation of their road and for power and lighting in the city.

Seattle, Wash.—The election of officers of the Union Illumination Company, as the Union Electric Company and the Seattle Gas and Electric Company are known since the consolidation of the concerns a few days ago, has taken place, with the following result: President, C. P. Stone; vice-president, Maurice McMicken; secretary, L. A. Turner; treasurer, E. C. Kilbourne. Mr. Kilbourne is general manager of the concern; John Mather, late manager of the Seattle Gas and Electric Light Company, is superintendent of the gas department, and A. L. Hawley, of the Union Electric Company, is now superintendent of the electrical department.

Elkhart, Ind.—Arrangements are now being made to begin work on the new Indiana Electric Railway. The road is to start from Elkhart and run as far as Plymouth, a small town south of South Bend, where it will join on the new Chicago electric line, which is now being built. The road from Plymouth to Elkhart will probably be finished in a short time. The power will be obtained from the St. Joseph River dam, on the Michigan and Indiana line, which is now in course of construction. An electric line from South Bend to Niles is to be built this year and another road from South Bend to Mishawaka is now nearly finished. The power will all be obtained from the St. Joseph River dam; besides this the dam is to supply several other cities and towns in Michigan and Indiana.

Niagara Falls, N. Y.—The second of the great Westinghouse dynamos is being put together at the power house of the Cataract Company.—The contract for the construction of seven miles of double track electric road from Niagara Falls to Lewiston, through the Niagara gorge, has been let to Craig & Tench of Buffalo by the Niagara Falls and Lewiston Electric Railway Company. The tracks will be ready for operation by July 1. Open cars 34 feet long and seating sixty people will be used in summer.—The final test in connection with the monster 5,000 H. P. dynamo already set up in the power house of the Cataract Construction Company was made on the 16th instant, when the huge machine was run for the first time to its fullest capacity, which means 250 revolutions to the minute. The test was an unqualified success, for the great machine worked with clock-like precision and regularity, and not a hitch occurred.

Telephone and Telegraph.

The King-Price Telephone Company have just completed a line which connects Wesson, Beauregard, Hazlehurst and Martinsville with Crystal Springs, Miss.

J. H. Theobald, the general manager for Wisconsin of the Strowger automatic telephone, states that his company expects in a short time to be able to supply telephone facilities to 10,000 subscribers in Wisconsin at $20 to $25 a year.

The Milwaukee *Journal* states that I. B. Reid, editor of the Appleton *Post*, has purchased an interest in the new Standard Telephone Company, and may become manager of the branch company in Wisconsin.

Capt. J. Hardwick Jackson has secured a franchise from the city council of Augusta, Ga., to establish and conduct a telephone exchange in that city. Mr. Jackson's company will be known as the Interstate Telephone and Electric Supply Company.

Omaha, Neb., is yearning for a new telephone company to come in and cut the rates of the company now giving service there at $5 a month. The business district of Omaha wants a $3 a month rate and $2.50 for each additional 'phone, says a business man in one of the papers.

The Chicago Telephone Company has reduced its rates to about 50 per cent. of its former charges. It has 11,000 subscribers in Chicago and the nearby suburbs, 3,000 of them residential. The company has arranged twenty-five circuits on the North Side to put in practical operation a service for placing two or more telephones on the same wire.

A representative of the Harrison Telephone Company who has been at Owensboro, Ky., taking subscriptions makes a very encouraging report.

The Mutual Telephone Exchange at Lincoln, Neb., has now 154 instruments in use and expects to increase the number to 200.

The citizens of Auburn, Neb., have organized a telephone company with an authorized capital of $5,000. The directors are J. W. Kerns, Thomas W. Eustice, George W. Cornel, Church Howe, J. S. Stull. The company proposes to advertise for bids for constructing a first class system of telephones for the use of the citizens.

The Cranford Mutual Telephone Company has filed articles of incorporation at Elizabeth, N. J.

G. E. Paine has been appointed general manager at Chicago of the Postal Telegraph Cable Company, vice F. G. McCurdy.

An application for a charter for the Citizens' Telephone Company of Chattanooga, Tenn., has been filed by F. I. Stone, W. D. Carswell, T. R. Preston, H. C. Abercrombie and Wm. K. Stone. The objects of the company as stated are "the purpose of manufacturing electricity for telephoning purposes, and of building, equipping and conducting a telephone exchange, and other business incident to the purposes mentioned."

J. P. A. Anderson has asked the council of Madrid, Iowa, for a franchise for telephone, electric light and waterworks plants.

Dr. D. P. Fahrney, of Frederick, proposes to build a telephone system in Hagerstown, Md., if proper encouragement is given by the citizens.

The Board of Commerce of Youngstown, O., at a meeting on the 15th inst., resolved that unless the Bell Telephone Company reduced its rate to $24 per year for residences and $30 for offices the board would request council to grant a franchise to a new company at these rates, to be secured by a five-year contract.

W. E. West will erect a telephone exchange at Milledgeville, Ga. He has already about seventy-five subscribers.

The Anthracite Telephone and Supply Company has ordinances for right of way before the town councils of Centralia, Ashland, Shenandoah, Girardville and Mahoning City, Pa.

The New York and Philadelphia Telegraph and Telephone Company has filed articles of incorporation with the county clerk at Jersey City. The company has a capital stock of $15,000. Its incorporators are Edward P. Meany, of Newark; Melville Egleston, of Elizabeth, and Alfred E. Holcombe, of New York. The object is to erect a telegraph and telephone line from New York to Philadelphia. It will pass through Hudson, Essex, Union, Somerset, Middlesex, Monmouth and Mercer counties in New Jersey. Its principal office will be in Jersey City. Work of construction will be commenced at once.

The Clinton Telephone Company, of Clinton, Tenn., has been fully organized, with Dr. R. K. Medaris as president and general manager. The company has twenty instruments in operation.

The president of the Oregon Telephone Company, at Portland, Ore., promises a substantial reduction in charges on the 1st of May.

There is a plan on foot to connect a dozen small cities and towns with Americus, Ga., by telephone. The towns include Smithville, Sumter, Bronwood, Dawson, Weston, Shellman, Richland, Parrott's, Preston and Plains, thus making a complete circuit.

The commercial exchange at Goshen, Ind., has transferred its telephone franchise to George M. Beers, of Fort Wayne, who will adopt the Anthony, a comparatively new telephone, placed upon the market since the expiration of the Bell patents.

S. P. Walmsley and others have applied to the New Orleans city council for a franchise. In their application they say they "have no interest, direct or indirect, with any person or concern residing outside of the city of New Orleans; that they propose to inaugurate a home enterprise, to be in the hands and under the control of our own people; that they have not opened negotiations with any one whatsoever regarding the purchase of telephones or the use of any particular device, or the sale or transfer of the franchise which is asked to be granted; that the best instruments which can be obtained are to be used, and that the service will be superior to any heretofore given to the people of New Orleans."

An ordinance has been prepared by the board of works of Indianapolis and submitted to the council requiring all telephone, telegraph and electric light wires to be placed underground within the limits of a square mile bounded by North, East, South and West streets. Sewers may be used for conduits.—The board has notified all the companies which propose to carry on a telephone exchange business to send samples of their instruments to the office of the board for examination by an expert. The companies notified are the Phœnix, Gamewell, Central Union and Cushman.

The Phœnix Mutual Telephone Company has been granted permission to erect poles and string wires in Bayonne, N. J.

A lawyer in New Jersey, wishing to attend a sale of real estate went to Bridgeton, only to find that the sale was just beginning at Vineland, twelve miles away. Nothing daunted, he went to the telephone, put in his bid by its means and captured the property. Then he took the next train and signed the necessary papers.

In Albany, N. Y., there is a movement on foot looking to the establishment of a local company to compete with the Hudson River Telephone Company. A franchise permitting the new company to place its wires underground will soon be asked of the common council.

The Southern New England Telephone Company has reduced its rates in all its third class and second class exchanges. The basis of reduction is the value of the service in a city compared with its population and the cost of maintenance of wires and exchanges in the different places.

The Wizard Telephone Company will erect a machine shop at Council Bluffs for the manufacture of instruments. Machinery has been ordered.

A call has been issued for a meeting of telephone representatives from all parts of the State of Ohio at Columbus on the 29th inst. for the purpose of discussing the establishment of a complete long-distance exchange covering the whole State.

Proposals for Electrical Supplies for the Government.

WASHINGTON, D. C., April 18, 1895.

The Commissioners of the District of Columbia are asking for bids for the following electrical supplies for use in the various branches of the government of the city for the fiscal year ending June 30, 1896. Sealed proposals will be received at the office of the Commissioners until 2 o'clock P. M. on May 9, 1895.

The following is a list of the articles and amounts of same for which bids are asked:

Sulphate of copper (bluestone)	15,000	pounds.
Sal ammonia, best	400	"
Sheet copper (No. 30 Brown & Sharp's gauge), cut in strips to order	300	"
Molded zincs (amalgamated), for Le Clanche battery	10	
Molded zincs, pure, crowfoot, per sample in office	15,000	"
Glass jars, No. 1, 6 x 8 inches	500	
Le Clanche battery, complete	10	
The Burnley dry battery	500	
Imperial dry battery	500	
Law battery, complete	500	
Holtzer-Cabot Monarch battery, with long zinc	500	
Cold drawn copper wire, No. 12	10,000	pounds.
Galvanized iron wire, No. 12 extra best, best quality	1,000	"
Copper wire, Okonite insulation, No. 16	2,000	feet.
Copper wire, Okonite insulation, No. 12	500	"
Copper wire, Okonite insulation, No. 14	1,000	"
Office wire (copper), No. 16, wound and braided, paraffined and polished	200	pounds.
Office wire (copper), No. 18, wound and braided, paraffined and polished	20	"
Copper wire, two conductors, annunciator, No. 16	1,000	feet.
Copper wire, twin Okonite cable, No. 14	400	"
Register paper, cut and wound on spools to order	1,500	pounds.
Register paper, cut and wound loose on spools, chemical	100	"
Double telephone cords, tips complete (3 feet long)	500	
Double telephone cords, short (2 feet long).	500	
Glass screws (insulators), Western Union	2,000	
Brackets, screw, oak painted	1,000	
Double-pointed (telegraph) tacks	10	pounds.
Cross-arms, standard size, best yellow pine, painted, with steel pins, locust screw tips, complete	5,000	feet.
Screw bolts, with washer, ½ inch x 7 inches.	1,000	
Climbers, extra spring steel, with straps (Stubbs)	6	pairs.
Insulator pins, steel, locust screw tip, per sample	1,000	

WASHINGTON, D. C., April 18, 1895.

Sealed proposals will be received at the office of the Superintendent until 2 o'clock P. M. on May 9, 1895, for furnishing the Treasury Department and its annexes with electrical supplies for use during the fiscal year ending June 30, 1896.

The following is a list of the different articles upon which bids may be given:

Adjusters for lamp cord, hard rubber; sample required, each. Batteries, dry, sample required. Batteries, Le Clanche (any form) sample required. Binding posts, brass, machine screw, assorted. Binding posts, brass, wood screw, assorted. Bushings, hard rubber. Buttons, push, bronze, sample required. Buttons, push, nickel, sample required. Buttons, push, pear or similar shape, complete; sample required. Bells, vibrating, 3-inch gong, iron box, sample required. Bells, vibrating, 3-inch gong, sample required. Bells, vibrating, 3-inch gong, skeleton frame; sample required. Cups, porous, for Le Clanche batteries. Cut-outs, fixture, double-pole, porcelain. Cut-outs, porcelain, for ceilings. Cut-out plugs, one to thirty lights. Cut-outs (branch), D. P., porcelain, one to thirty lights. Cut-outs, branch, one to thirty lights, D. P. Cut-out wire, assorted, per pound. Chatterton splicing compound, per pound. Dove-tailed rosettes, K. W., No. 104 Western Electric Catalogue, or equal thereto. Dove-tail rosettes, K. W., No. 106 Western Electric Catalogue, or equal thereto. Handles, wood, for electric lamps. Joints, hard rubber. Key receptacles, polished brass, Edison pattern. Keyless fusible wall receptacles, Electric Engineering Supply Company's Catalogue, or equal thereto. Keyless receptacles, polished brass, Edison pattern. Key, fusible, wall sockets, Electric Engineering Supply Company's Catalogue, or equal thereto. Key sockets, polished brass, Edison pattern. Keyless sockets, polished brass, Edison pattern. Lamp cord, 2-twisted conductor, No. 12, silk covered, per yard. Lamp cord, 2-twisted conductor, No. 14, silk covered, per yard. Lamp cord, 2-twisted conductor, No. 16, silk covered, per yard. Lamp cord, 2-twisted conductor, No. 18, silk covered, per yard. Plugs, attaching, Edison pattern. Push-button plates, complete, nickel, 2 buttons. Porcelain insulator knobs, No. 1,929 Western Electric Catalogue, or equal thereto, sample required, per 100. Safety wire holders, porcelain, No. 1, No. 2,566 Western Electric Catalogue, or equal thereto, sample required, per 100. Safety plugs, Edison, No. 6,341, per dozen. Shades, tin, flat, green exterior, white interior, 8 inch, 3-4 inch holder, each. Shades, tin, flat, green exterior, white interior, 10-inch, 3-4 inch holder. Shades, porcelain, flat, 8 and 10 inch, for 3¼ inch holder, each. Shades, green reflector, ground glass bottom, 9 and 12 inch, each. Shades, silvered reflector, ground glass bottom, 9 and 12 inch, each. Shades, tin, cone, green exterior, white interior, 8 and 10 inch, 2 1-4 and 3 1-4 holders, each. Shades, porcelain, cone, green, 8 and 9 inch, for 2 1-4 inch holder, each. Shade holders, 2 1-4, 3 1-4, 3 3-4 and 4 inch per dozen. Staples, safety, insulated, Nos. 10, 15, 20, 25, 30, per 100. Tape, Okonite, white or black, per pound. Tape, Grimshaw, white or black, per pound. Wire, equal to Kerite, Nos. 8, 10, 12, 14, 16, 18, per foot. Wire, gutta-percha, insulated, Nos. 14, 16, 18 and 20, per pound. Wire, office, No. 14, per pound. Wire, two conductors of No. 14, No. 33 copper wire, insulated with silk, for pear-shaped buttons, per yard. Zincs, for La Clanche batteries (any form), sample required, per dozen.

All bids on the above material must be each, except where otherwise specified.

All further information can be obtained from Chief Clerk, Superintendent's Office, Treasury Department, Washington, D. C.

Independent Electric Company.

The Independent Electric Company, 39th street and Stewart avenue, Chicago, say that their recent reduction in the price of Fuse Wire and Links is having a marked effect on the business in this line. Their brand of Fuse Wire is well and favorably known for its uniformity and also the convenient and attractive manner in which it is packed.

The above familiar illustration has recently been registered by the Independent Electric Company as a trade-mark.

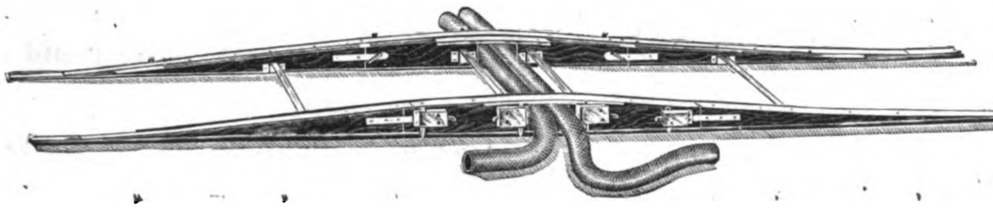
Packard Lamps.

Among the old stand-bys in the incandescent lamp line none have been better regarded by the public than the Packard Lamp, made by the New York and Ohio Company, Warren, O. Since the Bate case decision the company have returned to the old style of lamp, and are now ready to supply customers quickly with a standard lamp in the success of which there is no uncertainty.

A Portable Hose Bridge.

The Metropolitan Electric Company of Chicago are placing on the market a Portable Hose Bridge, for which the following features of merit are claimed:

Made of the best steel and second-growth oak; it is easily placed in position, ready for work, inside of three minutes; strongly and securely braced and clamped to the rail, making it impossible to get out of position; will carry the heaviest motor cars fully loaded; being but 8 inches high at its center and 16 feet in length, the rise of the car in passing over is almost imperceptible; weight of a bridge is 400 pounds; is in three sections to each side and easily carried on a car or "hurry up" wagon; two lines of 4-inch hose can pass under each bridge; every bridge guaranteed for ten years; the first time used will more than pay for its cost; overcomes the inconvenience of transfer checks and blockades; cars run on schedule time during a fire with the use of this bridge.



PORTABLE HOSE BRIDGE.

The illustration of the bridge, shown herewith, makes its application plain. It is a desirable acquisition to any railroad company's outfit.

INCORPORATIONS.

The American Electric Works Company, Denver, Col.—to buy, sell, rent, manufacture and repair all kinds of electrical steam and mechanical machinery. Capital stock, $10,000. Promoters: Wm. Thorne, Thomp. C. Walton, Chas. E. Hawkins, all of Denver.

The Roth Multi-Cylinder Motor Company, Cincinnati, Ohio—to manufacture and sell gas and gasoline and electro-motor engines and locomotives. Capital stock, $100,000. Promoters: Gilson W. Roth, H. L. Roth, J. M. Blair, Jos. Blair, R. C. Bliss.

The E. S. Kawly Electrical Construction Company, Chicago, Ill.—to engage in electrical construction business; instal electrical apparatus in buildings and elsewhere, etc. Capital stock, $12,000. Promoters: E. S. Kawly, V. Merriman, J. H. Weber.

The Metropolitan Electric Street Railway Company, Chicago—to operate a street railway in the counties of Cook, Du Page, Kane, Lake and Will, Ill. Capital stock, $5,000,000. Incorporators: Robert P. Parker, Richard E. Breed, James F. Dagley.

The Standard Telephone and Electric Company, Minneapolis, Minn.—to manufacture telephones and other electrical instruments. Capital stock, $50,000. Promoters: S. S. Kilvington, E. W. Batchelder, H. C. Dodge, Geo. L. Scott, Minneapolis.

The Osburn Electric Supply Company, Chicago, Ill.—to manufacture and deal in electrical goods, machinery, supplies and electrical appliances of all kinds, and carry on a general electrical business. Capital stock, $12,000. Promoters: Harry C. Osburn, M. Roy Osburn, Asa W. Waters.

The Milwaukee Incandescent Lamp Company, Milwaukee, Wis.—to manufacture and deal in incandescent lamps. Capital stock, $25,000. Promoters: John J. Reilly, M. J. Reilly, Barney Davis, Milwaukee.

The Felts Primary Battery Company, Sacramento, Cal.—to purchase, lease, operate or dispose of all kinds of electrical rights, patents, licenses, batteries, machinery, apparatus and other property pertaining to electric lighting. Capital stock, $1,000,000. Promoters: W. W. Felts, R. Watkins; Thos. E. Fogalsang, G. W. Merrell, Sacramento.

The Atlantic Coast Electric Railroad Company, Asbury Park, N. J.—to construct and operate a street railway or traction company. Capital stock, $1,000,000. Promoters: Wm. H. Hurst, John J. Walsh, J. Henry Haggerty, all of New York, N. Y.

The Manhattan Incandescent Light Company, Gloucester City, N. J.—to manufacture, prepare, buy, sell and otherwise dispose of the Welsbach and other incandescent lights and burning devices. Capital stock, $500,000. Promoters: Waldron Shapleigh, Camden, N. J.; Thos. Dolan, Randal Morgan, C. R. Collins, of Philadelphia.

The Cranford Mutual Telephone Company, Cranford, N. J.—to build and operate a telephone line. Capital stock, $10,000. Incorporators: William J. Lansley, Henry C. Thornton, Joseph Watterman, Wilfred C. Allen, George W. Littel, James Rodgers and John Rodgers.

The Wizard Telephone and General Electrical Manufacturing Company, Council Bluffs, Iowa. Capital stock, $100,000. Incorporators: Eli Brown, C. J. Willow and J. E. De Lee.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED APRIL 16, 1895.

ELECTRIC RAILROADS AND APPLIANCES.

537,626. Electric-Railway Conduit System. Harry A. Belden, Washington, D. C. Filed Jan. 26, 1895.
537,630. Electric-Railway Conduit System. Albert N. Connett, Washington, D. C. Filed Jan. 26, 1895.
537,672. Electric Railway. Jean Claret and Olivier Wuilleumier, Lyons, France. Filed Sept. 19, 1894.
537,706. Sectional Conductor for Electric Railways. James F. McLaughlin, Philadelphia, Pa. Filed Feb. 7, 1895.

ELECTRIC LIGHTS AND APPLIANCES.

537,493. Machine for Securing Filament-Holders Into Globes of Incandescent Lamps. Arnold J. Spiller and John R. Massey, Cleveland, Ohio, assignors to the Buckeye Electric Company, same place. Filed May 17, 1894.
537,498. Incandescent Electric Lamp. Elihu Thomson, Swampscott, Mass., assignor to the Thomson-Houston Electric Company of Connecticut. Filed May 23, 1892.
537,555. Filament and Carbon for Electric Lamps. Peter Stiens, London, England. Filed Feb. 14, 1895.
537,617. Electric-Arc Lamp. Charles A. Pfluger, Chicago, Ill., assignor to the Standard Electric Company, same place. Filed July 2, 1894.
537,633. Electric-Arc Lamp. Edward H. Crosby, Boston, Mass., assignor of one-half to Otis M. Shaw, same place. Filed Aug. 13, 1894.
537,693. Process of Evacuating Incandescent Lamps. Arturo Malignani, Udine, Italy. Filed Aug. 15, 1894.

DYNAMO ELECTRIC MACHINERY.

537,480. Commutator. Gwynne E. Painter, Baltimore, Md. Filed Feb. 28, 1895.
537,541. Regulator for Dynamo-Electric Machines. Walter S. Moody, Lynn, assignor to the General Electric Company, Boston, Mass. Filed Aug. 30, 1893.
537,549. System of Electric Distribution. Edwin W. Rice, Jr., Swampscott, assignor to the General Electric Company, Boston, Mass. Filed Feb. 21, 1894.

TELEPHONE AND TELEGRAPH APPARATUS.

537,464. Printing-Telegraph. Oscar L. Kleber, Pittsburg, Pa. Filed June 5, 1894.
537,603. Automatic Telephone-Exchange System. Ward Decker, Owego, N. Y. Filed May 14, 1894.
537,644. Telegraphy. Robert H. Morris, Roselle, N. J., assignor to the Western Union Telegraph Company, New York, N. Y. Filed Aug. 10, 1894.

BATTERIES.

537,474. Secondary Battery. William M. McDougall, East Orange, N. J. Filed Jan. 7, 1893. Renewed June 15, 1894.
537,475. Secondary Battery. William M. McDougall, East Orange, N. J. Filed Aug. 2, 1894.

MEASURING INSTRUMENTS.

537,499. Electric Measuring-Instrument. Elihu Thomson, Swampscott, assignor to the Thomson-Houston Electric Company, Boston, Mass. Filed Oct. 26, 1894.
537,500. Electric Measuring-Instrument. Elihu Thomson, Swampscott, assignor to the Thomson-Houston Electric Company, Boston, Mass. Filed October 26, 1894.
537,501. Electric Measuring-Instrument. Elihu Thomson, Swampscott, assignor to the Thomson-Houston Electric Company, Boston, Mass. Filed Oct. 26, 1894.
537,769. Electric Meter. Haydn T. Harrison, London, England. Filed June 14, 1892.

MISCELLANEOUS.

537,515. Electric Switch. James J. Wood, Fort Wayne, Ind. Filed Nov. 12, 1894.
537,533. Electric Switch. Edward M. Hewlett, Schenectady, N. Y., assignor to the Thomson-Houston Electric Company, Boston, Mass. Filed Dec. 22, 1894.
537,538. Electric Switch. Amandus Metzger, Schenectady, N. Y. Filed Oct. 5, 1892.
537,539. Electric Switch. Amandus Metzger, Schenectady, N. Y. Filed April 15, 1893.
537,595. Electrical Interrupter. Gustaf J. Andersson, Brooklyn, assignor to the Ozone Company, same place and New York, N. Y. Filed Feb. 18, 1895.
537,665. Electric Switch. Henry P. Ball, Bridgeport, Conn., assignor to the Thomson-Houston Electric Company, Boston, Mass. Filed Oct. 19, 1894.
537,673. Electrically-Actuated Vehicle. John B. Clark, St. Paul, Minn. Filed March 3, 1894.
537,679. Oil-Guard for Electric Fans. Philip Diehl, Elizabeth, N. J. Filed May 24, 1893. Renewed March 20, 1895.

EDITORIAL NOTES.

Collapse of the Sperry Company. In another column will be found mention of a recent visit of a few G. E. dignitaries, including Messrs. Coffin, J. P. Ord and S. Dana Greene, to the city of Cleveland, and of their intermediate stop at Buffalo. The interpretation placed upon this visit is beyond doubt just what these old campaigners desired to go out to the public. The editors of the daily press have swallowed the gudgeon, and we shall await with some curiosity the use which the editors of our esteemed contemporaries of the technical press will make of this remarkable news item.

Mr. Coffin is wont to boast of the ease with which the public can be fooled, and the length of time during which the process can be kept up. It is not surprising, perhaps, that one who has succeeded for so long in fooling so many people, including his associate directors and the stockholders whom he has robbed, should be able to lead off on a false scent those reporters who treat his utterances as those of a frank and honest man.

The subject of which we treat here is one in which, however, Mr. Coffin, assisted by Mr. W. H. Lawrence, succeeded in fooling his brother directors for a season, much to their loss, but not long enough for him to reap the financial reward which he started out to gather in.

In passing, it may be remarked that Mr. W.H. Lawrence, who was discharged from his position as foreman in the Brush Works by Mr. Stockley for incompetency, has learned much in a few years, and would not now be discharged from any position requiring financial shrewdness and an elastic conscience, for the same reason.

While the trip to Cleveland mentioned above was noted with eagerness by the daily papers, and started ambitious hopes in the Chambers of Commerce in two cities, it did not presage any good either to Buffalo or Cleveland. It did not bespeak the birth of any new enterprise for either city. It was rather a delicate and roundabout method (such as might be expected from Mr. Coffin) of announcing the funeral of the Brush Electric Company of Cleveland, of the Sperry Electric Company, and of the death of the plans which Mr. Coffin and associates had so skillfully laid for extracting from the G. E. treasury in legal form $1,000,000, $500,000 of which could have been divided among friends in the old-fashioned way.

ELECTRICITY has watched the career of the Sperry Electric Company with considerable interest, and we have never lacked full knowledge of what was going on. We might have told the stockholders of the G. E. Company over a year ago that they were in a fair way to be robbed of a million dollars or more through this enterprise, but we preferred to wait. We had strong hopes that one or two of our particular friends would, if let alone, put their feet into so deep a hole in this transaction that their standing in the business world would be settled forever. But the president of the G. E. Company is no longer beyond suspicion among his associates, and their suspicions have apparently killed the Sperry deal before its completion.

Mr. W. H. Lawrence, formerly foreman at the Brush Works, and now the head of the National Carbon Company, is entitled to the credit for the discovery of the Sperry railway motor. He found it at Pullman, where Mr. Sperry had succeeded in getting one built; to Mr. Lawrence primarily Cleveland is indebted for the expenditure of $250,000 belonging to G. E. stockholders (not to Mr. Lawrence) in "promoting" the manufacture of it for two years in that city.

Mr. Charles A. Coffin, although coming in second, could of course never remain long in that position, and to him the G. E. stockholders are indebted for throwing away a quarter of a million dollars in his effort to produce a round million from the same source for an utterly worthless business.

When Mr. Lawrence first discovered the Sperry motor, and laid it before Mr. Coffin for consideration, the Short railway speculation was successfully closed. No less than $440,000 had been taken from the treasury of the Brush Company to boom the Short enterprise, and more money of G.E. stockholders finally was used to buy up the outstanding stock and close up the affairs of that company, leaving the few purchasers of their apparatus without a source of supplies for further repairs, and compelling the purchase of entirely new apparatus.

The Short Electric Railway Company still owes the Brush (G. E.) Company the $440,000 as above.

Mr. Coffin was successful in the Short deal—why not try it again? He did.

The Sperry Company had a capitalization of $250,000 in $100 shares. Of these, 247 were (and are) owned by Mr. Sperry and one each by Messrs. James Parmelee, Myron T. Herrick and W. H. Lawrence. Sperry had no money. The other three gentlemen are supposed to have paid cash for their stock, making a paid-up capital of $300 for the Sperry Electric Railway Company of America.

But if the company had no money it had money's equivalent. A trade was made with Mr. Coffin by which the Brush (G. E.) Company stood sponsor for the Sperry Company, made the apparatus and paid all the bills. It was hoped to continue this until the entire outfit could be unloaded upon the G. E. Company for $1,000,000.

But in some manner the attention of Mr. C. H. Coster was attracted to the huge indebtedness of the Sperry Company to the Brush (G. E.) Company, and the trip of the dignitaries to Cleveland last week was the result.

The Sperry Company is as dead as a salted codfish hung upon a nail, and there is no further inducement for Messrs. Coffin, Herrick and Parmelee to interpose any objection to closing the Brush Works. It was the opposition of these gentlemen which prevented their being closed while the private scheme still had a spark of life.

Sperry apparatus has been sold in five towns, the People's Traction Company of Philadelphia having 125 cars, the Chicago General Railway Company 20, and Carbondale, Waterbury and Youngstown smaller outfits. These purchasers can now make their own repairs or scrap their apparatus. They will probably do the latter.

If the stockholders of the General Electric Company, at the meeting on May 14, desire to take up for discussion the manner in which their money has been wasted, these deals of Mr. Coffin with the Short and Sperry companies are worthy of consideration. There was no legitimate reason for the T.-H. or G. E. Company making a trade of any nature with either. Neither motor could be recognized as a competitor of the then standards. They were not competitors, and would have died a natural and early death if let alone.

The only reason for Mr. Coffin meddling with either of them was the desire to rob the companies of which he was the trusted representative of a large personal rake-off in each case; and in one instance the desire was gratified.

The books of the Brush (G. E.) Company show to-day $440,000 charged to the Short Company and $250,000 charged to the Sperry Company—neither claim worth one dollar. The assets of the Sperry Company are *nil.*

According to the charter of the Sperry Company the stockholders are liable for the debts of the company up to twice the amount of their stock. This leaves Messrs. Herrick, Lawrence and Parmelee liable for $200 each, and Mr. Elmer Sperry liable for $249,400.

The fiat has again gone forth, and the works of the Brush Electric Company will now be closed for good.

Mr. Sam. Hamill has played for three years a successful engagement in the part of "The Great and Elastic Straddler." He will now come down on either one side or the other—probably the other.

Connecticut Railroad Matters. When it was announced a few days ago that the Connecticut Legislature, which has been hearing arguments for several weeks on the question of granting charters to electric roads paralleling to some extent existing steam lines, had decided not to make any general regulation, but to decide each case upon its merits as it came up, it was assumed in some quarters to be a victory for the trolley people. Such is not the case. Every application coming before the Legislature since the hearing, where the parallel idea was involved at all, has been decided adversely to the trolley interests and against the best interests of the people of the State.

There can be but one interpretation placed upon the action of these Connecticut lawmakers. The merits of the trolley system for interurban traffic are so thoroughly demonstrated, and have been so overwhelmingly recognized by the public at large, that these hayseed legislators can not crawl behind the pretext that they thought they were working for the public good. They were working chiefly in the interests of the Consolidated steam road company, which for years has controlled the body.

If there be one man among them who honestly holds that the State is under any obligations to the railroad company, he is sadly misguided. Paternalistic ideas have slight foothold in America, but the arguments offered by the railroad lawyers would outdo in this direction anything that we know of even in Germany, the stronghold of paternalism. These lawyers held that the State had really guaranteed that the investment in New York, New Haven and Hartford securities should forever be a profitable one. This is not exactly nonsense. It is socialism of too dangerous a tendency to be tolerated in New England.

The advance of the trolley has been checked; the people who need the new lines can now wait another season or two, but they will get it sooner or later.

It would not be a bad notion to make an issue of trolley extension in the next legislative election in Connecticut. The trolleyites would certainly win.

The Telephone Situation. An interesting review of the present condition of the Bell Telephone Company and of the telephone situation generally is offered to the readers of ELECTRICITY this week. Nothing, perhaps, of editorial comment is needed to show that the imperious Bell monopoly is broken, and that the great corporation which has so long treated the public with contemptuous arrogance is even now bending the knee, and will soon be begging for public favor.

There is no way of estimating exactly the amount of actual and legitimate competition already in the field against the Bell Company. There is enough of it to make itself felt and to reduce the Bell Company's income by several millions per annum.

Whatever this competition may be, however much it may grow, it can change the situation and produce results in time only. The Bell Company's inherent weakness is such that it must give way from this cause alone sooner or later. A few more strong companies in the field for actual business, a few more local Bell companies asserting their rights, and American Bell stock will be offered at 50 on the Boston Exchange.

Though the telephone business is wide open, we advise investors everywhere to go slow and look carefully into the affairs of the companies proposing to sell rights. Telephone rights are not worth a pinch of snuff. The company that has only *stock* to sell should have no consideration.

There are independent companies, with factories established, ready to sell instruments and to install exchanges. They are the only ones worthy of talking to, and there are not many of them in the United States. Examination would show that most of the new companies advertising in the *Electrical World* are nothing but stock-jobbing concerns, without money, without credit, without a telephone system—without anything in fact save plausible stories and stock or rights to sell.

This condition was inevitable, and it will soon clear itself, leaving the new companies with money, with men who understand the telephone business, and with fully equipped factories, in practical control of the field.

Under the Searchlight.

Views and Opinions on Timely Topics.

MR. D. O. MILLS is likely to retire from the G. E. Board this month.

* * *

AN Edison licensee advises us that the licensees who are paying 18 cents for Edison 16 C. P. lamps are paying too much, as his last purchase was made at 12.5 cents net f. o. b. New York.

* * *

IN line with arguments advanced by ELECTRICITY some weeks ago in favor of keeping up the price of the standard incandescent lamps to a fair price, we are able to state that the Westinghouse Electric Company, immediately upon the announcement that they were prepared to deliver the Sawyer-Man lamp at 25 cents in barrel lots was actually deluged with orders. There is a large proportion of lamp buyers who realize that the best lamps on the market are none too good, and that an inferior lamp like the Edison is not worth buying at any price.

* * *

WE understand that Mr. Webster, he who worked-'em-all, has been uneasy of late over the casual remarks in this column concerning the procurement of the G. E. charter and the way the bribery fund was manipulated. Mr. Webster is getting nervous too soon; we have not yet told half the story which is available. When we have told it all, he might be nervous enough to go abroad. He and Mr. Clapp might go together.

* * *

NOTWITHSTANDING the payment of unearned dividends on Consolidated Electric Storage Company's stock, the price has declined to $1.50 and $2 per share—par value $25.

* * *

WE were in error last week in stating as a fact that G. E. preferred stock cannot be scaled down. There are two opinions upon this subject, both advanced by able counsel. The attempt will probably be made to reduce it one-half, and the matter will be settled in the courts.

The Electropoise and Religious Journals.

A Public Disgrace.

(From the Troy Press.)

It has become an axiom among promoters of questionable projects that the religious press of all class publications is the most easily satisfied to accept the advertisements of their wares. Humbugs and frauds which even the daily press reject as unfit for its columns are often greedily sought after by the editors of religious papers of easy conscious, simply because of the financial returns which they bring.—ELECTRICITY.

That this is true of many religious papers is proven by their own columns; but not of all. Now and then a denominational journal is careful to keep its advertising as well as reading columns pure and wholesome; but our observation leads us to say that it is really exceptional. At any rate most of the religious papers that we see print plenty of advertising of a class that is almost daily rejected by the *Troy Press*. Many advertising frauds send cash with their orders so as to lessen the likelihood of rejection, and it is no exaggeration to say that we return hundreds of dollars annually because the matter offered is objectionable. To see vile medical advertisements, catchpenny announcements for agents at fabulous salaries and other devices to defraud the public in a journal which purports to be religious is disgusting. A good family paper will keep its advertising no less than its reading columns free from that which is fraudulent, immoral and vicious.

May 1—"About this time look out for fish stories."

The following is taken from the Cleveland *Plaindealer*, but has appeared in slightly different form in many other papers:

BUSINESS IS BOOMING.

The G. E. Company Will Build New Factories.

President C. A. Coffin, Vice-President S. Dana Greene and Treasurer J. P. Ord and other directors of the General Electric Company, which does a large share of the electrical business of the country, have been in Cleveland for the past few days. They held a conference Monday at the works of the Brush Electric Company.

The matter under consideration is the consolidation of several of the company's plants in one mammoth concern. The gentlemen were in Cleveland to canvass the prospects for securing a site here.

"We have been in Buffalo," said one of them to a reporter yesterday, "and in that city a Buffalo syndicate offered to erect our buildings and present us with land for the plant. Their offer was equivalent to $1,000,000. A New Jersey concern has made us an equally desirable offer. The matter is as yet undecided and if Cleveland wishes to make an offer she has a fair field. We do not regard Buffalo as in any way superior to Cleveland, but of course Buffalo has made a fine offer."

It is probable that the matter will be submitted to the Chamber of Commerce. The plant will employ between 4,000 and 6,000 men. In the event of the plant being located in some other city than Cleveland it is not improbable that the Brush works may be a part of the consolidated concern and be moved with it.

A rumor about town yesterday was to the effect that Tom L. Johnson would endeavor to secure the works for Lorain.

AMERICAN BELL'S WEAKNESS.

Its Patent Foundation Gone, the Structure Totters.

NO LONGER A MONOPOLY AND RUINOUSLY CAPITALIZED.

Facts and Figures Concerning the Present Status of the Telephone Business.

New England investors have been mercilessly scourged during the past ten years, and unless all signs are at fault further desperate punishment is in store for them. They lost $125,000,000 in Union Pacific and collateral securities; $140,000,000 in Atchison; $80,000,000 in Northern Pacific and allied enterprises; $65,000,000 in Burlington and $20,000,000 in General Electric—a grand total of $430,000,000.

Each of the five properties was in its turn raised high upon the pedestal of New England favor and worshipped with blind idolatry. All New England was wrapped up in them. Three went into total collapse and two have shrunk and shriveled under the shadow of the coming of the auctioneer's red flag. They are in the list of "badly disfigured."

American Bell Telephone now ranks as the leading "gilt-edged" security into which the fetish loving New Englanders are investing their money, and the dews of death are glittering on the brow of that sacred monopoly. Its corpse is in preparation for New England's already overworked financial morgue. Founded in fraud, fostered by bribery and corruption, attempting to prolong its life by what has been judicially declared to be "grand larceny," and fattened into vast size on the fruits of oppression and rapacity, the hideous monster—ranking in public estimation as one of America's greatest monopolies—is an empty shell. More properly speaking, it is rotten to the core. It has reached the "confidence game" stage, and longer silence by the press as to its real condition would amount to participation in the robbery of thousands of widows and orphans and an army of innocent and deluded investors who have put their aggregated savings and trust funds into the property under the belief that it was as safe as Government bonds. It is the one security that New England brokers urge first upon anxious customers who come to them with a few hundred or a few thousand dollars to invest.

WHAT THE COMPANY IS.

What is American Bell Telephone? It is a corporation capitalized at $50,000,000, the basis of which is ownership in patents that have expired, and in the earning power of its stock in subordinate companies which are confronted with a newly arisen and overwhelming opposition that has already cut into their business and forced a reduction in telephone charges all over the country of from 25 to 50 per cent. These subordinate companies are face to face with an angered public, threatened on every hand with hostile State and municipal legislation, and pinned to the ground with the inexorable necessity of spending vast sums to renew plants so as to be in a position to meet the vigorous competition that is springing up in every community.

These subordinate or operating companies are capitalized to the extreme limit of earnings under most favorable conditions, and they are in nearly every instance bonded to the amount represented by the actual cost of their plants. These minor companies have a capital stock of very nearly $80,000,000 and their bonded indebtedness approximates $35,000,000.

During 1894, the best year in the history of the telephone business, and the last (final) year of the existence of the monopoly, the sub-companies earned $3,800,000 net to shareholders, of which $1,937,000 went to the parent company (the American Bell). The dividends of the sub-companies averaged a shade less than 5 per cent. Since that money was earned and paid out the telephone charges throughout the country have been cut 25 to 50 per cent., as above noted, and 100,000 instruments have been put in by opposition companies. With equipment allowed to run down in order to pay dividends on distended capitalization, the necessity confronts the Bell sub-companies of reducing revenues one-third and of raising more money with which to rehabilitate plants—a situation which may be described as gloomy viewed from an investment standpoint.

TROUBLE IN ITS OWN CAMP.

That portion of the income of the American Bell Telephone Company derived from the dividend on its $38,268,000 holdings in the stock of sub-companies is threatened with practically total extinction.

The total revenues of the American Bell last year were $4,848,294.94, according to the annual statement of its president, of which $1,937,657.77 was from its stockholdings, as noted. The largest source of income, however, was from royalties on patents which are now extinct. These royalties average $4 on each telephone, or 50 per cent. of the cost of the instrument. There are 604,000 telephones in the Bell service, and the royalties paid by the sub-companies into the treasury of the parent company footed up $2,502,922.17 in 1894.

This enormous tribute, amounting to 55 per cent. of the total revenue of the American Bell, is robbery pure and simple. It is blood money extorted by the parent company for certain so-called rights which have ceased to exist by reason of the expiration of the patents. By virtue of majority holdings in the stock of the sub-companies the hoggish parent company forced upon the lesser corporations contracts requiring the payment of such royalties in practical perpetuity. This palpably and remorselessly jug-handled arrangement for the extortion of $2,500,000 a year from subordinate companies has already aroused the furious indignation of many of the more far-sighted of the minority holders, and a suit at law has been commenced by one of the directors in the Central Union Telephone Company, an organization covering the greater part of Ohio, Illinois and Indiana, to restrain the monopoly from further exactions in that direction, the plea being that when the patents expired upon which royalties had been paid the right to demand such royalties should in justice cease also, and that contracts binding his company to continue such payments were extortion and thereby invalid. The director referred to is Mr. Milo G. Kellogg, a wealthy man of Chicago, and his attorney is ex-Solicitor General Aldrich. The minority stockholders in other companies throughout the country are watching eagerly the development of this suit, and from the mutterings which are heard in every quarter it is not unlikely that similar suits will be instituted in other courts. Another ground upon which the validity of these contracts is to be attacked is that they are null because the management of the company receiving the benefits controlled the majority holdings in the subordinate companies represented by the other end of the contract. The courts have held repeatedly that directors or officers or those in control cannot make legal and binding bargains with themselves as individual officers for the control of other corporations. The point has never been raised before as between the American Bell Telephone Company and its numerous subordinate companies, but the fight has now been opened and will be pushed to a conclusion.

The only hope the minor companies have of obtaining money without borrowing it, with which to keep up their plants, is in relief from the royalty robbery. Revolt against further submission to this robbery is so general that relief is certain to follow. With the illegality of these contracts established, the principal source of American Bell income is gone.

THE INSIDERS USED FORESIGHT.

Reading the handwriting on the wall and realizing the inevitable, "insiders" several years ago organized the American Long Distance Telephone and Telegraph Company under the laws of New York to serve, it is broadly intimated, as a raft upon which to float out all that is valuable of the American Bell when the collapse should come. The American Long Distance is capitalized at $12,000,000 and is heralded as the future rival of the Western Union and Postal in the telegraph field. It is a parasite that has grown upon and into the American Bell, and it is sapping the vitality of the parent company. Wherever and whenever it is possible, business is being diverted from all other Bell companies into the Long Distance. This is beautiful for the Long Distance Company but it is difficult to see wherein the American Bell shareholders are going to be benefited at the "show down." Nobody but the "insiders" know precisely what the relations are between the American Bell and the American Long Distance Company. Official reports are silent on that point, and the thousands of small investors are kept in the dark as to the true inwardness of the deal. Explanations are urgently demanded and are overdue.

Of the $50,000,000 authorized capital stock of the American Bell, $20,500,000 has been issued. At current quotations on the Boston Stock Exchange (180) it has a market value of $37,000,000. "Knowing" holders have been kindly letting widows, trustees, savings banks, preachers, school teachers, servant girls and the great army of small investors have the stock around top figures for a year or more, and the suffering when it comes will descend upon thousands instead of upon the few. The wolves will get away and the lambs will be left to endure the punishment. The unloading process is far from complete, however, and fearless publication of the iniquity of the thing may yet save other thousands who would, if left in ignorance, drift upon the shoals of disaster or stumble blindly into the trap set for them.

THE MONOPOLY IS BROKEN FOREVER.

A few of the weak points in the armor of the telephone monopoly are presented in the foregoing enlarged discussion and analysis of these points, and incidental reference to other matters will tend to further enlighten on the general situation—conditions necessary to a full and complete understanding of the facts in the case. It is in regard to the permanency of the earning power of the American Bell that stockholders and the investing public are chiefly concerned, for it is upon "earning power" that there has been reared the stupendous telephone capitalization represented by—

American Bell	$50,000,000
Sub-companies	80,000,000
Bonded debt	35,000,000
Total	$165,000,000

Monopoly is the arch upon which this sky-scraping structure of securities rests. Cut the ground from under monopoly and the huge pile tumbles.

How thoroughly and effectively the monopoly is already broken is shown by the ferocious competition that is meeting the old companies at every turn and in every quarter, and to add to the embarrassment of the Bell people, the Legislatures of half the States in the Union are considering bills to reduce the telephone charges to about one-half former rates. Such bills are pending in the Legislatures of Wisconsin, Illinois, Ohio, Pennsylvania, New York, Minnesota, Iowa, Missouri, Texas, Kentucky and nearly all the Southern and Northwestern States. Bills have also been introduced and are being pushed for the compulsory interchanging of business with other telephone companies already established or to be established. The Bell would have the people believe that opposition is all in the air. This is very far from being the case. Local companies are springing up all over the country, and no less than ten having control of available patents are already in the field. The Standard Telephone Company, which has been recently exploited in the newspapers as being about to grapple with the old monopoly on even terms so far as capital goes, is as yet entirely in the air. It has no exchanges in operation, and its achievements are all in perspective. In some quarters it has been hinted that the Standard is merely a Bell decoy, put up for the purpose of frightening off genuine competition. These suspicions may or may not be groundless. Time alone will determine that.

The Harrison Telephone Company has already many exchanges in operation, with a total number of about 40,000 instruments in use, and is making considerable headway in several Western and Middle States, and the smaller companies are succeeding in proportion.

A few instances may be mentioned illustrative of the irrepressible tendency towards a reduction in telephone rates. In Norwalk, Ohio, the Bell Telephone Company has offered to do business at $12 a year as against an old charge of $4 a month. In Crawfordsville, Ind., the Bell people are offering to supply service at $12 a year instead of $48 as formerly. At Lafayette, Ind., the price was formerly $48 a year; it is now $12. Indianapolis, Ind., charges have been reduced from $60 to $30. Decatur, Ill., now has a $12 service in the place of one costing $48 a year. A large reduction at New Orleans, La., is noted. Throughout Illinois, Wisconsin and Iowa charges have been reduced 25 to 40 per cent. In New York City there has been a reduction (on paper) from $240 to $80 and upwards a year. Just what the reduction is in that city has not yet been fully developed. It may or may not amount to anything immediately, depending on contingencies not possible to forecast. In Topeka, Kansas, there has been a reduction in charges from $60 a year to $18 a year. In Salina, Kan., Selma, Ala., and Durham, N. C., the Bell people are offering to do business for a year or more for nothing, and equally cheap terms have been offered in several other Western communities. Masillon, Ohio, Fort Wayne, Ind., and Port Huron, Mich., are also in the class that is now paying $12 a year instead of $48, the price ruling last year. A perfect epidemic of reduction has struck the very citadel of Bell monopoly—New England itself.

Scores of mutual co-operative companies are springing up all over the country, their basis being an assessment on subscribers for the bare cost of the plant and the payment of monthly charges just sufficient to cover operating expenses.

Chicago and many of the larger cities of the country have been attacked by independent companies, and it is only a question of time when the inhabitants of the great communities as well as the small towns will enjoy the benefits of competition. In Chicago the Bell Company charges averaged $125 a year. To shut out competition it has reduced its rate to $60 a year, a loss of revenue on 11,000 instruments amounting to $715,000 per annum. The newly organized companies enter new fields on the basis of average charges of $24 a year, whereas the old companies have been charging from $48 to $100 a year. In Ohio a State Association of independent companies is forming to fight the Bell.

It will be seen from the above that the Bell monopoly is being savagely attacked at the very base and fountain-head of its income.

FINANCIAL CONDITION.

Of tangible assets the monopoly is very poorly equipped. As stated, its foundation and very life is its earning power. As has been shown, the two large items under this head are being subjected to a line of attack that cannot help but be fatal in the long run. The old companies are placed at the grave disadvantage of being over-capitalized. They have been stocked to the full extent of an earning power that could only be enjoyed while they held an undisputed monopoly of the entire field. New companies starting in on business have an enormous advantage from the outset. They are not under the necessity of earning dividends on a large amount of "wind" capital, and neither are they handicapped with contracts requiring the payment of extortionate royalties on dead patents.

The aggregate bond and stock capitalization of the subordinate telephone companies in the United States under the Bell control approximates $115,000,000. The plants of these several companies consist largely of 604,000 telephone instruments and a little less than 400,000 miles of wire of all kinds. These plants can be duplicated for less than $40,000,000 according to competent authority. The telephone instruments, switchboards, poles, wires, etc., can be furnished at a cost of about $60 a subscriber. This calculation provides a total of less than $35,000,000 and an additional allowance of $5,000,000 to cover every other possible contingency.

The telephone business of the old companies must earn enough to pay returns on $80,000,000 local stock capitalization and $36,000,000 (market value) in the parent company stock, or $116,000,000 in all, besides interest on $35,000,000 bonds, and this on a plant that can be duplicated for less than $40,000,000. The earnings from the business for the year 1894 may safely be called a maximum. It represents the climax of fifteen years' development in a field in which there was no competition. Now, with rivals at every crossroad and pressing for admittance into every community, is it reasonable to suppose that that maximum can be maintained? That is something that anxious stockholders are already asking themselves.

Expert accountants who have undertaken in all candor and get at the true inwardness of the annual financial statement of the American Bell say that it is entirely too subtle for even their trained understandings. There are items of which no clue to their real meaning is given. For instance, in the liabilities there appears the item of $10,228,571 under the head of

"Patent Account" (Profit and Loss). Now as the patents have become worthless by their expiration, it is difficult to see how they should figure at all in this statement. They very evidently counted originally as part of the capital of the company. On the same side of the ledger there appears to the account of "Profit and Loss" $5,849,444, to account of "Reserves" $4,222,756, and to account of "Surplus" $2,152,000. What these various accounts mean is something to which the anxious inquirer is afforded no clue by the officers of the company. The four items, "Patent Account," "Profit and Loss," "Reserve" and "Surplus" foot up $22,500,000. So far as anybody knows, that vast amount may mean something, anything or nothing. So far as official explanation goes the terms are meaningless. As a convenience in bookkeeping they stand as a partial offset to the assets, which, as before stated, foot up to something like $45,000,000.

The balance sheet also affords a field for the scrutiny of the curious. Under the head of "Expense" are to be found the following items: "Legal Expenses," $178,342.88; "Interest and Taxes," $356,417.51; "Commissions," $459,915.71; "Concessions," $231,713.64.

President Hudson naively remarks that the expenses for legal services in the coming year will be much smaller than they were last year, important litigation having been closed. This is good. The litigation which is over terminated in the destruction of all that was left that was of any value to the Bell people in the way of patents. The reduction in legal expenses by reason thereof is a good deal like the saving in a doctor's bill for catarrh after a man's head is cut off. Some curiosity is shown as to what is really meant by the outlay for "interest and taxes." It is shown by the report that the investment in telephones is $1,209,000 and in real estate $951,000, a total of a little over $2,000,000. Taxes on that could not be very heavy. The bonded indebtedness of the Company is $2,000,000, bearing the exorbitant rate of 7 per cent per annum. Stretching everything, legitimate expenses for taxes and interest could not exceed $150,000. Where did the rest of the $356,000 go to? To what purpose was it applied?

It would likewise be interesting to know what sort of "commissions" absorbed the enormous sum of $459,000. Was it commissions on "grease" of the kind best known in State capitols during the sessions of Legislatures? Details upon this point would be interesting. And then something might be furnished with regard to "Concessions" that would be information for which stockholders are clamoring. The accounts that are classed as "Legal Expenses," "Interest and Taxes," "Commissions and Concessions," cover a vast amount of mystery. Under these headings nearly $1,350,000 was expended during the year 1894. There is absolutely no explanation given as to where the money went, how it was spent, or what for.

Now here is another phase of this question to be further considered: In order to meet the newly arisen competition the old companies are obliged to rebuild their lines at an enormous outlay of money, which outlay must be provided either by further increase of capitalization or by the extension of their bonded indebtedness, or taken from their greatly reduced earnings. These are the plain facts which confront the owners of this heretofore immensely profitable business, and it is folly to be blind to conditions that are patent to the whole world. In view of the facts, investors of an inquiring turn of mind will be slow in accepting the brave statements of the friends and upholders of the American Bell Company that dividends will be continued at anywhere near old rates. The arrangements between the parent and subordinate companies give to the former every possible advantage, and so long as fat dividends were being earned no complaint was heard. But now that there is a very strong possibility of a reduction all along the line, the minority holders who put up all the cash that had been invested are getting into an ugly frame of mind. The iron is entering their souls, and they are beginning to see that they are due to suffer from the operation of the agreements now existing. To them the future looks exceedingly blue. They are compelled to skim off the first layer of earnings to meet the interest on an aggregate bonded indebtedness approximating $35,000,000 and then to submit to the payment of tribute to the parent company at the average rate of $4 per year on all instruments used before they can begin to see a dollar for themselves. That is a pretty severe tax on an earning power that is already subjected to serious impairment. Without burdening the reader with too many details, it is pertinent in this connection to give a list of the more important subordinate companies which control the business in the United States. Their names are as follows:

The New York and New England Telephone Company, covering Maine, New Hampshire, Vermont, Massachusetts. This company has an authorized capital of $12,000,000, of which $10,394,000 has been issued It has a bonded indebtedness of $2,541,836.

The Providence Telephone Company of Rhode Island.

The Southern New England Telephone Company, occupying that portion of New England not covered by the two last mentioned.

The New York and Pennsylvania Telephone Company, covering a portion of New York, Pennsylvania and Delaware.

The Metropolitan Telephone and Telegraph Company, covering the city of New York and the country thereabouts within a radius of thirty-three miles. Capitalized at $3,300,000 and bonded at $2,000,000.

The New York and New Jersey Telephone Company, covering Staten Island, Brooklyn and nine counties of Northeastern New Jersey. Capitalized at $3,000,000 and bonded at $2,827,800.

Chesapeake and Potomac Telephone Company, covering Maryland, Virginia and the District of Columbia.

Cumberland Telephone Company, covering Tennessee, Kentucky and a part of Indiana.

The Southern Bell Telephone Company, covering the southeastern States.

The Southwestern Telephone Company, covering Texas, Louisiana and Arkansas.

Missouri and Kansas Telephone Company, covering Missouri, Kansas, Indian Territory and Oklahoma.

The Rocky Mountain Telephone Company, covering Colorado, Wyoming, Utah, Nevada, Idaho and Montana.

The Sunset Telephone Company, covering the Pacific slope.

The Wisconsin Telephone Company, covering Wisconsin.

The Michigan Telephone Company, covering Michigan.

The Nebraska and Erie Telephone Companies, covering Nebraska and the Dakotas.

The Iowa Telephone Company, covering the State of Iowa.

The Central Union Telephone Company, with $10,000,000, covering Indiana, Illinois and Ohio.

The Chicago Telephone Company, with $5,000,000 stock capital, $2,000,000 bonded debt, covering Cook County, Ill.

Details infinite in variety might be lugged in to fill the skeleton outline of the story and support the statements presented above, but a multiplication of facts would only carry the recital to unconscionable length. Bell history in its brutal entirety would fill volumes.

Advanced Electrical Work at Columbia College.

To determine whether or not the sluggish effect which opposes the transmission of electrical impulses in submarine cables and other conductors of high static capacity can be overcome, a series of elaborate experiments are now in progress in the electrical department of Columbia College. Prof. Pupin has the experiments in charge, and most flattering results are confidently expected.

Prof. Pupin is devoting his personal attention to the perfection of a multiplex system of telegraphy which will operate without the necessity of the delicate adjustment and balancing now required in the quadruplex system.

OPPORTUNITIES IN ELECTRICAL ENGINEERING.—II.

BY A. A. ATKINSON.

The question now is, with conditions as they are, which offers the most to the young man? So far as it can be seen at present, considering the number of positions open, the practically educated young man has the advantage, though if the technical graduate be willing to begin low in order to learn the practical elements of the business and to convince his employer of his superior ability and skillfulness, he will find plenty of opportunites for promotion; he can then leave the lower position to another beginner. But unless he be willing to do this, the practical man who is in a sense previously prepared for work in any application has much the advantage. Besides, he knows the practicalities, the other has them yet to learn.

I believe the day is past when we should expect new and wide applications to develop suddenly to require the services of a number of men; the surprises in lighting and power and transportation are not in the future. When these things were new, men not educated had to fill the positions; horse-drivers became motormen, fire-stokers station men, and steam engineers "electricians." Now as these industries widen, and that rapidly, the great problems are a more efficient service, stricter economy in all directions and a gradual weeding out of the undesirable, thus making room for those prepared to render the best service. Necessarily this process has been slow for several reasons, but now that the various departments of the electrical business have become permanently established, this will be more rapid. The bad wiring, the wretched installation, the miserable economy of operation which have prevailed in the majority of cases in light and power plants for small towns, and also in very many not so small, will gradually disappear, because the services of trained men are beginning to be appreciated and sought. For the same reasons new installations will be manned by those who are prepared for the work.

I can probably best indicate the situation to the electrical student by outlining the kinds of positions that may be open to him. So, not by any means including all, but serving as a broad basis of division, let us lay down the following: (1) Original investigation and invention. (2) Consulting and constructing engineer. (3) Superintendents of light and power plants, including isolated and central station work, stationary power, railways, mining, etc. (5) Artisans in light and power. (6) Artisans in factories. Those belonging in the first class I shall call electricians. Those in the second, third and fourth classes may properly be denominated electrical engineers. To be sure this is not meant to consider those cases where some member or stockholder of the company is made "superintendent" whether there is an engineer besides him or not. If he has not the electrical knowledge, and does not actually superintend the electrical part of the work, his title is a misnomer. Properly, in small towns where this is done, he should be superintendent or business manager of the "company" and not of the plant or works. It will be quite evident, also, that the station man in a small plant, who also looks after the wiring and general repairs, is not entitled to the distinction of electrical engineer. He is merely an artisan, and the plant and town are without an engineer. I assume in this connection that only he who has practically passed through the preceding steps and has arrived at the point of being the real superintendent of all the construction and repair of electrical appliances, whose theory and practice and experience entitle him to this distinction, shall be called electrical engineer in the sense in which I am using the title. Under (5) and (6) I mean to include all, highest to lowest, engaged in actual work in manufacturing establishments, and in the actual operation of electrical appliances in lighting and power.

As to numbers, we observe that those belonging to class (1) are comparatively few. Their preparation will be of the highest kind, technical and theoretical. The work of research must be undertaken only by those who have an intense love of truth for its own sake, and are willing to devote many weary days to its search with the expectation of no other reward than the great satisfaction of having added something to the world's knowledge. Science may indeed pause to do them tardy honor. Men of this stamp we all can name, and none are more deserving of the world's gratitude for their noble sacrifices in behalf of truth. Such men have established the laws of chemistry, physics and electricity—indeed have built the foundations of knowledge in all lines. They have established the bases for the modern practical applications of science, and they have invented practical devices for applying their discovered principles. They have given us the photophone, the phonograph, telephotography, the telautograph, the possibilities of electrical welding, heating, cooking, transportation and hundreds of others. And yet their work is not done. There are the problems of light without wires, the real nature of electricity, light and power without the present wasteful methods—perhaps by maintaining very high frequency vibrations—electrical energy directly from the sun, methods of improving the magnetic circuit of dynamos, earth telephony, etc., etc.

Very little need be said about class (3), for the number of places is necessarily limited, being open generally only to those who have received a special training in the factory itself. New establishments select men of experience from factories elsewhere. But those who are fortunate enough to secure places as artisans are the material—some of them—out of which those more enviable men are made.

There are much greater opportunities in class (2) and these will be on the increase. As the tendencies are more and more to stricter economy, least first expense and more efficient service in general, the electrical engineer will be more and more in demand. The time is rapidly approaching when every central station, lighting and power, and every form of electrical business, will have their consulting and installing engineers. The preparation for this work must be founded in practice. Without going into detail, it is apparent that the technicalities of engineering alone will be of little avail. The reason for many failures in the successful installation and operation of electrical plants has been that the "theories" of those in charge were not backed up by a thorough practical knowledge and experience.

Classes (4) and (5) have the advantage of by far the greatest number of individual opportunities; and as the financial condition of the present improves this will be true in a still larger measure, since capital being less conservative will hasten to invest in the business which when rightly managed promises the largest per cent on the outlay. The gradual adoption of electricity by steam roads and by new competing roads joining important centers, the rapid extension for lighting into towns everywhere, the enlarging of existing plants to meet the exacting demands for greater and better service, the extension of electric power into mines and other forms of industry —all will have the effect of opening up new and wider opportunities. But in the same proportion there will be the greater demand for more thoroughly prepared men. This needs no particular illustration; but to take a single instance, lighting, as representative of the situation in general, it has been stated on good authority that if electricity should supplant gas for lighting purposes the cities of New York and Philadelphia alone would at once require all the dynamos and lamps now in use in all the United States. I believe this is what we are gradually but surely coming to. With the inevitably cheaper production and more satisfactory results gas must die hard after a severe struggle, the Welsbach with its other devices. It can readily be seen what the advantages of electricity are, and the people will demand and get it. It needs no argument that the preparation for these two classes must be a thoroughly practical one—practical in the sense in which I have been taking it.

Under the head of (6) comes a number of positions, though much smaller than under (4) or (5). On the whole these places are not so desirable, since the chances for advancement will be limited to very few in this line of work.

From the foregoing outline it will be apparent that the men educated along what I have called practical lines have far the better chance for promotion under the present conditions, and the places they are at once able to fill are much more numerous. The technical graduate is prepared for (1). True he may work in (2) and the rest if he first goes to work to prepare for them by practical study and experience, either in school or under private instruction, with an apprenticeship. This done his higher instruction will be of much advantage to him. But I cannot help deprecating the tendency of our so-called technical schools in their instruction to sail off into the generalities, refinements and abstractions to the neglect of those things which are more essential for the immediate use of the great majority of their graduates.

I wish to repeat that there are and will be opportunities abundant for those rightly educated. In numbers they compare at least very favorably with those in other professions. Students must of course be taught the difficulties of low salaries at first—not speaking of the many favorable exceptions to this,—hard work and perseverance. But is this any less true in most other kinds of business as a rule? One great reason for the apparent overcrowding of the electrical profession is that so many are educated for positions that do not exist instead of preparing to meet the conditions as they are.

Athens, O., April 17, 1895.

Last of Prof. Crocker's Lectures.

The concluding lecture in Prof. Crocker's popular course at Columbia College, on the practical applications of electricity, was given on Thursday evening last. "The Telegraph and Telephone" was the subject. As in previous lectures of the course, Prof. Crocker gave considerable attention to the history and development of the art, making plain at the same time the extreme simplicity of the principles upon which the several instruments are operated. The synchronous and quadruplex systems were explained in detail, and experiments made to show the method of operation. To show the sluggish effect which the high static capacity of an ocean cable has upon the transmission of electric impulses, the most novel and interesting experiment of the evening was made. This experiment and Prof. Crocker's explanation of it clearly demonstrated why it is not possible to use the Atlantic cable for telephonic communication with Europe.

In connection with his remarks on the telephone, Prof. Crocker said it was only fair to the telephone companies in large cities to state that the complexity of connecting 10,000 or more subscribers is infinitely great, in fact almost insuperable. Hence it stands to reason that telephone service in large cities must of necessity be an expensive luxury.

ARC CARBONS AND THE RATING OF ARC LAMPS.*

DISCUSSION.—(*Concluded.*)

Prof. Thomas, of Columbus—I am not a member of this Association, and now have the pleasure of attending one of your meetings for the first time; but, as some of you know, I have been more or less interested in the questions involved in lighting by incandescent and by arc lamps, and noting the title of this paper on the programme which was sent to me, I brought with me the results of some work which has been done recently at the State University at Columbus bearing on the point under discussion. I thought it might be interesting to the members to know what the results of that work were. The work was undertaken with particular reference to the bearing of facts upon the proposed watt rating of arc lamps which grew out of the discussions of the Electrical Congress during the World's Fair. The measurements consisted in the determination of the amount of light given by the amount of carbons, not when they were mounted in arc lamps, but mounted in rigid holders, the length of the arc adjusted to a definite amount by means of the chain of the arc formed by a lens upon a screen. The strength of the current passed through the carbons was ten amperes. The length of the arc and readings of voltage required and candle power were measured by means of the Weber portable photometer (?). The carbons upon which measurements were made consisted of ten or more pairs of carbons, obtained from nearly all the central stations in the State of Ohio. The carbons were obtained by students of the university from their homes, or by their friends at home from lots of carbons that were in regular use in street lighting service, for the purpose of getting at the facts as to the light actually given by the carbons. The point of the investigation was to determine how much variation there is in the candle power afforded by arcs which are maintained at an expenditure of a constant amount in watts.

The watts that we made use of in the investigation were a little higher than the rating adopted by this Association, namely, about 500 watts, as nearly as we could judge. Our machinery was adjusted so as to work steadiest at ten amperes, and with the arc length we find commonly maintained in lamps in Columbus we found that sometimes 51 or 52 volts was required to maintain the arc in that condition.

With this brief explanation as to what the work consisted in, I may briefly run over the results, without of course naming the makes of carbon upon which the measurements were made. Readings were taken at different angles in the lower hemisphere, but without stopping to read the results showing the variation at different angles. I will give the results at 45 degrees, which has been found is about the angle at which the light is produced.

I find in the case of the first make of carbons tabulated that at 45 degrees the candle power measured ranges between 1,855 and 1,422. These readings which I give you are the results of the averages of readings taken from six to ten pairs of carbons of the individual make, and readings taken in each case by different observers, so as to eliminate as far as possible personal error, and to get as nearly as possible a basis for judging of the uniformity of performance of a given make. The variation in the candle power of this make shows 23.3, with variation of 3 per cent. in watts. The candle power relation is widely different from the relation of watts. Second make, similar data, candle power 8.86 to 14.29; variation in candle power 38 per cent., 2 per cent. in watts. The next make, 55.6 candle power, 7 per cent. variation of watts; candle power 977 to 2,200. Here is a reading of 2,200. These readings are worked up by my students, and are abundantly substantiated by individual work of my own.

---

* A paper read before the N. E. L. A. at Cleveland by L. B. Marks.

The next make of carbons gives a variation of 39.8; 2.2 watt variation. Next, candle power 20.48 to 1,370, 33 per cent. variation in candle power for 2.3 variation in watts. Next, 40.3 in candle power, one-half of 1 per cent. in watts. Next, 45 candle power, with ⅞ in watts. Next, 26 variation in candle power, with 2.8 variation in watts. Next, 44.7 variation in candle power, 3 in watts.

The foregoing will answer in part the question which was partly answered by Mr. Marks as to the influence of size, etc., whether the carbons are coated or uncoated. The difference between them is shown here at 45 degrees. The average candle power of all makes with uncoated carbons, 1,677; half coated carbons, 1,474, of the same size, $\frac{7}{16}$; uncoated, candle power 1,611; coated, 1,459. In both these cases the smaller carbon has the smaller candle power. Of course, this is not to be taken as conclusive, because the point of investigation was not to determine the influence of size; and I should say from a scientific point of view there are many points left out of this investigation.

Not being a member of your Association, it would of course be improper for me to argue upon the question of the propriety of the watt rating; but I have done so much work in the matter, and am so interested in the success of your work, that I may perhaps be pardoned for expressing myself on the question. I think the watt rating is simply taking a step in one direction which does not tend in any degree to remove the trouble which you all experience, and you are simply changing the ground, that is all. My idea as to what should be done I have privately urged for some time. It is substantially that set out in Messrs. Houston and Kennelly's paper, read at this meeting, that the proper basis for a contract between a municipality and a corporation, the object of which contract is the lighting of the streets of a city, is the illumination that is produced upon the street. I care not whether the light be done by electricity, arc or incandescent lamps, or by gas, or gasoline, what the citizens want is light upon the streets; and if your contract will specify the degree of illumination required to be satisfactory under the usual weather conditions obtaining in a given place, and you name that in your contract, and then determine at any time when the question arises whether you have that illumination or not, you will have an easy means of settling your controversy. There will be no question of arc lamps, candle powers, or anything of that sort. Find out what the fact is as to the illumination which your contract calls for.

I cannot refrain from expressing a word of criticism, which I shall do in print soon, upon the paper of Messrs. Houston and Kennelly in regard to the instrument which was presented. The idea underlying that instrument was discarded some two or three hundred years ago. The principle that underlies it was one of the earliest made use of in the attempt to measure the intensity of light, and it was found unreliable, and the reason for it was set forth by Prof. Thomson in his remarks. The human eye is the thing which makes it unreliable. There are too many and serious differences in the eyes of individuals, and differences in the same eyes at different times. The instrument is an interesting thing for a person to use to satisfy himself, but when it is presented as a means of settling disputes in which values are concerned it seems to me that we ought to have had something better, something more susceptible of more accurate and reliable results, than that proposed.

Mr. Ayer—I do not agree with the last speaker that in rating the arc lamp by wattage we have made no progress. We have gotten from an absolutely indeterminable thing, candle power, to something we can put our hands on. When we contract for watts we can furnish them. It may not be the best way, but it prevents impositions on the central station manager. It is known that it is a very crude method of determining; but as yet nothing has been proposed other than the instrument offered here, which seems to me an impracticable device. Prof. Thomas tells us he gets a variation of 45 per cent. in candle power with a change of ⅞ per cent. of wattage. That is a very extreme difference. It does not seem as though we find much of that in ordinary practice, and it is an extreme case. It is an unstable thing we get our light from—the carbons. There is nothing uniform about them, and there is no way of determining what character or size of carbons are best adapted to particular cases. I think we would all welcome something which will definitely determine the amount of illumination to be given people at a definite distance from the light, or any point on the street, under usual conditions. In having wattage we have something definite; if we give you that, there it is; if we do not, you can talk to us.

Mr. Armstrong—I thought better things of Mr. Peck than what he stated here about our definition of what a two thousand candle power light was meaning nothing at all. When we agreed, in giving a two thousand candle power light, to furnish 450 watts, we met the conditions as well as they can be met. The truth of the matter is that candle power is the measure of light and we cannot change it, and we must make ourselves conform to that in some way, and we did the best we could when we selected the standard of watts.

Prof. Marks—A few words with regard to Prof. Thomas's remarks. The data submitted by him are certainly interesting and directly in line with reports contained in the paper. We are all aware of the occurrence, but probably not of the magnitude of the variations he refers to. However, though it is only too true that the candle power for the same watts may differ fifty or one hundred per cent. or more with different carbons, yet, for reasons given in my previous discussion, I do not see how the Association could be benefited by adopting a standard of candle power. From a practical standpoint it seems to me that it would be just as unwise for the central station manager to sell his lamp as a three hundred or a five hundred candle power lamp as it would be to sell it as a twelve hundred or a two thousand. There is of course no doubt of the value of making some measurement of the illumination, and, as has been suggested, the proper place to measure the illumination is not at the lamp but at the place which is lighted. In one case we may find that distribution is the all-important feature, the intensity of the maximum rays being of secondary importance, and in another vice versa. Though the same amount of energy be supplied in the case of two lamps trimmed with special carbons, one of them whose candle power is much less than the other may be preferable because of the quality of the light.

Before closing I wish to call your attention to a test in which two carbons, tested for mean hemispherical candle power, showed 456 and 486 candle power respectively. On being tested for efficiency they showed 11.71 per cent and 10.01 respectively. The efficiency referred to here is the radiant efficiency or ratio of luminosity to total radiation. The current in each test was nine amperes, and the P. D. forty-five volts. One of the carbons was a squirted coke carbon, the other a molded.

It will be noted that the carbon showing the higher candle power had lesser efficiency. It seems quite probable that in this case the difference in the quality of light explains the discrepancy.

Death of William J. Richardson.

In the death of Mr. William J. Richardson, of Brooklyn, which occurred last Thursday morning, the street railway fraternity loses one of its most conspicuous and able members and the city of Brooklyn one of its most estimable and honored citizens. For seven weeks prior to his death Mr. Richardson had been a sufferer from complicated nervous diseases, which developed into acute spinal meningitis.

At the time of the recent strike in Brooklyn Mr. Richardson was called upon to perform a task which a less able man would have failed to successfully accomplish. As an official of the Atlantic Avenue Railway Company he was forced to do that which was for the best interests of his company. As president of the Atlantic Avenue Railway Employees' Mutual Aid Association he desired that the employees of his company be accorded the kindest and fairest treatment. As an evidence of the employees' faith in his honesty, integrity and fairness no more striking proof could have been offered than their unanimous request that he be permitted to arbitrate the questions which were made the issues of the strike.

WILLIAM J. RICHARDSON.

Mr. Richardson was born in Albany forty-six years ago. His street railway experience began in 1867, when he became his father's assistant in the management of the Brooklyn and Jamaica Railroad. When the Atlantic Avenue Company was organized he was made secretary, which position he held until the reorganization of the company, when it passed into the hands of the Brooklyn Traction Company. He was one of the organizers of the American Street Railway Association and served continuously since 1882 as its secretary and treasurer. He held the same office in the New York Street Railway Association. In this capacity Mr. Richardson became widely acquainted in street railway circles. The efficient manner in which his duties were discharged, coupled with his faithful, earnest work for the advancement of all that pertains to street railway practice and construction, and the cultivation of more cordial relations between street railway interests and the public, brought to him the well-merited distinction of being the foremost leader in this field.

LEGAL NOTES.

The Supreme Court of Michigan has affirmed the judgment of the lower court in the case of Louis George and others against the Wyandotte Lighting Company, thus confirming the contract made in 1892 by the city with the Western Electric Company for the construction of an electric light plant.

Judgment has been rendered against the South Bend and Mishawaka Railroad Company in the suit brought by the Central Trust Company of New York to foreclose a bond mortgage amounting to $250,000, and also against J. McM. Smith, the purchaser for the company of the equipment for the road. The latter suit was for $29,000, and was brought by Isaac B. Newcombe. The company operates an electric road from South Bend to Mishawaka, five miles in length.

Henry B. Oakman and Harry M. Shaw, doing business as the Oakman Electric Company, manufacturers of electric specialties at No. 136 Liberty street, New York, have made an assignment to William D. Murray, of Plainfield, N. J.

Justice Russell, in the Supreme Court, has vacated the assessments made by the Commissioners of Taxes of New York for the year 1894 upon the personal property of the General Electric Company, the Edison Electric Light Company and the Edison General Electric Company, on the ground that they are taxable only at their principal place of business, Schenectady. New York County loses about $200,000 by the decision.

Judge Taft has handed down his decision in the suit brought at Cleveland, O., by Francis Lowrey, executor of the estate of Grosvenor P. Lowrey, against the Cowles Electric Smelting and Aluminium Company and Alanson T. Osborn for infringement of patent sold and assigned to plaintiff by Charles Bradley for a process of separating metals, particularly aluminium, from their ores by the use of an electric current, etc., the Judge holding that the defendants had infringed. He granted the plaintiffs a perpetual injunction, restraining the defendants from using the patent rights and ordered the letters of patent held by the Cowles people canceled and declared void.

The Westinghouse Electric and Manufacturing Company has filed a bill in equity against the Suburban Electric Company at Philadelphia, alleging infringement on several patented improvements, the exclusive right to which the complainant company claims. The improvements are for electro-magnetic motors, invented by Nikola Tesla, of New York, who assigned one-half interest in his patents to Charles F. Peck, and Tesla and Peck subsequently assigned them to the plaintiff company. The Westinghouse Company has also filed a bill against John Mustard, charging infringement by the defendant on the plaintiff company's patented improvements in method of electrical distribution.

Personal.

Dr. Arthur Brown, who has been representing the T.-H. International Company in Brazil for some time, has returned to this country to stay, and is now at his home near Boston.

Mr. Chas. Bragg, manager of the Westinghouse Company's Philadelphia office, was in New York last week.

Mr. Charles E. Bibber has opened offices at 620 Atlantic avenue, Boston, as New England agent for the Columbia Lamp Company and the Wagner Electrical Manufacturing Company, of St. Louis.

Portable Electric Light Plants.

To the Editor of ELECTRICITY.

DEAR SIR: In your issue of the 17th, under the heading "A Large Portable Plant," you say a successful test was made. I presume you mean a successful test was made with that particular plant, as the idea is not new. Portable electric light plants consisting of a vertical quick steaming boiler, high-speed engine, coupled direct to dynamo, were sold by Woodhouse & Rawson, Queen Victoria street, London, Eng., in 1889. Yours truly,

TRAVELER.

To Form a State Association.

A call has been issued signed, by the more prominent gas and electric light men in Texas, for a meeting at Houston on May 22 for the purpose of forming a State Association.

New York Electrical Society.

The April meeting of the New York Electrical Society was fixed for the 25th, when Mr. T. L. Wilson was to have delivered a lecture on Acetylene. At the last moment Mr. Wilson had to leave for the West and Mr. Edward Durant kindly filled the gap by repeating before the Society on the 24th ult. his lecture given on the 16th before the Brooklyn Institute on the Manufacture in the Electric Furnace of Diamonds, Rubies, Aluminum and Acetylene Gas.

Boston Notes.

Attention is being called through the Boston papers to the condition of the overhead wires of the West End Railroad Company throughout this city.

The Nantasket Beach branch of the New York, New Haven and Hartford Railroad is being equipped with electricity.

The lamp business in Boston is remarkably quiet at present. It was expected that several new companies would start up after the verdict in the Bates Refrigerator case, instead of which things rather look the other way. The low prices have apparently scared people against going into business.

The West End Railroad feeder wires throughout the busier parts of Boston are to go into underground conduits.

R. H. White & Co., the mammoth dry-goods firm, having just completed an extensive addition to their establishment, have placed the contract for lighting the store with four hundred arc lights.

Electric launches are to be run on the ornamental ponds in the various pleasure parks and pleasure grounds in and around Boston this summer.

Electricity is being utilized for advertising purposes in this city on a scale that is not approached in any other city in the country. To stroll through the streets of Boston after dark, strangers would be more than surprised and impressed by the magnificent displays that are made at the theatres and other places of amusement as well as by the principal restaurants and dry-goods stores.

General News.

What is Going on in the Electrical World.

Montrose, Pa.—A committee has been appointed to examine and report on the subject of electric lighting for this town.

Toronto, Can.—The question of civic electric lighting for this city will be submitted to a vote of the people on the 25th of May.

Salem, Mo.—A stock company is to be formed to build and operate an electric road from Salem to Licking, Houston and Cabool.

Batavia, N. Y.—The survey of the route proposed for the Batavia and Northern Railroad, from Oak Orchard to Batavia, has been completed.

Harrisburg, Pa.—A bill has passed the House of Representatives permitting electric street railways operated within the State boundaries to carry freight.

Columbus, Ga.—Grigsby E. Thomas, Jr., a prominent attorney of this city, has outlined a plan for an electric road connecting Columbus and Atlanta.

Brattleboro, Vt.—The Gaslight Company will put in a plant to furnish electric power for small manufacturers and users if they are assured of a sufficient demand.

Flushing, L. I.—An application has been made to the highway commissioners for a franchise to operate an electric road from the Whitestone line to Willett's Point.

Muncie, Ind.—A choice of routes for a new electric street railway in this city is being considered. George F. McCulloch is mentioned as being interested in the project.

Fulton, Mo.—The light committee of the council has been instructed to ascertain the probable cost of an electric lighting plant for this place and to receive bids for the same.

Little Rock, Ark.—It is reported that a company has been organized here to utilize a sixty-foot fall on a mountain stream not many miles from Little Rock to generate electricity for transmission to this city.

Rushville, Ind.—M. L. Howe, of Indianapolis, has presented a proposition to the city council offering to construct waterworks and an electric light plant for $70,000, four-fifths of the capital stock to be taken by the city.

Monroe, Mich.—Mr. Fenton, of Findlay, O., has applied to the city council for a franchise for the Citizens' Electric Railway Company giving them the right to operate an electric line in certain streets of this city.

Stockton, Cal.—Harry Bunn and J. W. Hartzell are busy securing the rights-of-way for the electric railway they propose to construct between here and Lodi. These have been secured for about two-thirds of the distance.

Hackettstown, N. J.—The lamp committee of council has been instructed to advertise for bids for lighting the streets of the town by electricity for the coming year with 85 or more electric lights of 20-candle power each.

Pittsfield, Mass.—The stockholders of the Stanley Electric Manufacturing Company have voted to increase the capital stock of the company from $200,000 to $300,000. The officers report a rapidly increasing business.

Flint, Mich.—John E. Nolan, of Saginaw, who is interested in the Owosso and Corunna street railway, has been here lately looking over the field with the view of putting an electric street railway line in operation in this city.

Allegan, Mich.—W. B. Brittin has been granted a patent on an electrical transformer, and is now arranging for the manufacture of it. A stock company will be formed and a factory started at either Benton Harbor or Coldwater or at Chicago.

Port Huron, Mich.—Sealed proposals will be received and information given by W. F. Wagenseil, city clerk, until the 20th of May for furnishing the city of Port Huron with electric light. From 150 to 200 arc lamps of 1,200 C. P. will be required.

Parkersburg, W. Va.—The Parkersburg Electric Light and Power Company and the Parkersburg Gas Company have consolidated. Neither company sold out to the other; they simply combined and will hereafter be operated under one management.

Moorhead, Minn.—The city council has accepted plans for a new pumping station and electric light plant to be built here this summer. Bids will be advertised for at once. Citizens are unanimously in favor of the plan of the city doing its own lighting and pumping.

Bucyrus, O.—The commissioners have granted a franchise for the Inland Electric road between Bucyrus and Sulphur Springs, a distance of seven miles. M. J. Monnett, the president of the company, states that work on the road will begin at the earliest possible moment.

Waukon, Iowa—An electrician with $3,000 or $4,000, to take interest in and full management of a lighting plant and business in a growing town, where receipts of $300 to $400 per month are guaranteed, may hear of something to his advantage by addressing G. L. Hubbell at this place.

Grand Rapids, Mich.—The Sweet Electric and Manufacturing Company of this city has filed with the city clerk a mortgage to E. H. Donnally as trustee. The mortgage covers all the company's stock, patents, accounts, etc., and is given to secure over $12,000 indebtedness due on labor and other claims.

Muncy, Pa.—A charter has been granted to Senator John J. Coyle, Charles N. Brumm, Patrick Campion and C. O. Smith, giving them the right to build an electric railroad from Muncy to Picture Rocks, a distance of eight miles. The incorporators have obtained the right of way and will begin work in a short time.

Deckertown, N. J.—B. W. Decker has resigned as president and general manager of the Sussex Electric Light, Water and Power Company. R. A. Sinn has been elected president and J. W. C. Casher general manager.

Atlantic City, N. J.—The lighting committee of city council recommend that the contract for lighting the city be awarded to Metzger & Co. for 20 cents a lamp per night, on the condition that they file a bond for $50,000 and have their plant ready for operation by May 30, when the contract with the old company expires.

Santa Barbara, Cal.—The supervisors have granted the franchise for the proposed electric railroad running from the city limits through the Montecito and Carpinteria valleys. The council has practically granted a franchise for the road to run through the city, the form of advertising for bids for the franchise being the only delay.

Chicago.—The Metropolitan West Side Elevated Railroad is approaching completion and trains made up of motor cars and trailers are now running on the portion of the structure that is finished. The road is operated by electricity on an elaborated plan of the intramural road at the World's Fair, the third rail supplying current.

Galion, O.—Proposals will be received at the city clerk's office until noon, May 6, for an incandescent light dynamo of 120 K. W. capacity, including exciter and all necessary station equipment, to be delivered at the city's electric light station. All proposals must be accompanied by a check, duly certified, for $100, as a guarantee.

Peterboro, Can.—Two hundred employees of the Canadian General Electric Works here have been discharged for refusing to sign a new rule of the company making the workman liable for the full value of any machine or part thereof which he had the misfortune to damage, or for defects found in an article that has passed through his hands.

Medina, N. Y.—A portion of the track of the Beecher Railway between Waterport and the lake has been finished and is in working order. The work is being pushed as fast as possible. An experimental car is being built to test the possibilities of the system for high speed work. It is expected to obtain a speed of 150 miles an hour.

Sandusky, O.—The Sandusky Electric Light Company at a recent meeting elected the following directors: Watson Hubbard, H. C. Huntington, C. E. Cooke, George E. Reiter, T. F. Spencer, J. O. Moss, Charles H. Moss, A. C. Moss, C. W. Sadler, Jacob Knebeler, James Woolworth, C. G. Nielsen, George R. Butler and George Feick.

Oneida, N. Y.—A scheme is on foot to establish a new electric light plant here to compete with the Warner Electric Light Company. Chas. E. Remick, chairman of the street lighting committee of the board of village trustees, is the leader in the movement. Five thousand dollars' worth of stock has already been subscribed and much more has been promised.

Lockport, N. Y.—Samples of a new insulating material formed of sponge crepon, supplied by the Sponge Cloth Company of this city and indurated by a process discovered by a Lockport man, have been sent for examination to leading electricians by the United Indurated Fibre Company who will manufacture it if the material proves to be of value.

South Haven, Mich.—At an election held here recently it was decided to bond the town for $10,000 to be used for the construction of an electric light plant. Mr. H. Zeedyk is a member of the committee appointed to advertise for bids. [In last week's news summary an item containing this information was by mistake headed "South Haven, Mass."]

Quebec, Can.—A project is on foot to furnish electric lighting to Levis from the Chaudiere Falls, which are 95 feet high and will give 500,000 horse-power. The distance is eight miles from Notre-Dame de Levis. These falls, though less in height, are greater in volume than those of Montmorency, which, with a height of 140 feet, afford only 300,000 horse-power.

Rochester, N. Y.—The Proctor Raymond Electric Company, organized March 8, 1893, with a capital of $20,000, has gone into the hands of a receiver, E. A. Marsh. In the papers presented to the court it is stated that the assets of the corporation, if well cared for and sold for what they are worth, will bring $42,863.74, and that the liabilities do not exceed the sum of $29,883.17.

Omaha, Neb.—A project much talked of here at present is the building of a canal from the Platte River at Fremont to an available point for the erection of a power-house on Papillion Creek, where the water power developed could be used for generating electricity to be transmitted to Omaha. It is estimated that 18,000 horse power is attainable through a suggested engineering plan.

Madison, Wis.—The lighting of the capitol by gas has become intolerable to many of the legislators and a proposition to provide for an electric lighting plant for the building, to cost $13,000, has been adopted.—Gov. Upham has signed the "street car vestibule bill," making it the duty of street car companies to provide a sheltered compartment on their cars for the motormen.

Buffalo, N. Y.—At the annual election of the Buffalo General Electric Company the following directors were chosen: Daniel O'Day, New York; Thomas Hodgson, H. W. Burt, J. M. Brinker, W. H. Orcutt, W. W. Sloan, J. L. Williams, P. P. Miller, Franklin D. Locke, S. S. Spaulding and C. R. Huntley, Buffalo; S. D. Greene, Schenectady, and George Urban, Jr., Cheektowaga.

Oakland, Cal.—The first electric railroad constructed in Oakland was finished less than five years ago, and at the present time the city is literally gridironed with electric street railroads which reach out in all directions. There are at least fifty miles of well-equipped electric railroads, furnishing rapid means of transit to and from the neighboring villages as well as to different parts of the town.

Rome, N. Y.—The application of the City Street Railway Company for permission to change its motive power from horses to electricity or any other power besides steam has been approved by the railroad committee of the common council. The recently elected directors of the company are J. S. Wardwell, W. P. Rayland, A. C. Kessinger, J. D. Higgins, W. R. Huntington, W. L. Kingsley and James H. Searles.

Columbus, Ind.—An electric device has just been invented by Dora Ogden, manager of the Western Union office at this place, by which steam whistles are to be blown by electricity, the current passing through an electric clock. By this device every factory whistle in the city, or in the United States for that matter, can be sounded simultaneously. The whistle may be set to blow at any hour desired.

Chattanooga, Tenn.—Under the auspices of the Chamber of Commerce a survey is to be made at once for an electric railway from this city to the Chickamauga National Military Park, which includes the battlefield. The promoters of the enterprise have elected the following officers: President, D. M. Steward; vice president, James R. McFarland; secretary, John M. McFarland. Directors: A. L. Ross, J. M. Rife, Geo. O. Fisher, Jos. Aull, G. P. Wilbanks.

Baltimore.—Mayor Latrobe has approved the Washington and Baltimore Boulevard Electric Line ordinances. The contractors have received orders to push the work with all possible haste, as the company is anxious to have the line in operation within the time prescribed by the charter granted by the last Congress, which was eighteen months. The road will be as near an air line between Baltimore and the national capital as possible, about thirty-two miles, and will cost about $2,000,000.

Pass Christian, Miss.—A company has been organized under the franchises granted to C. Phelps, L. B. Moseley and others to build an electric street railway from this village to Biloxi. The company is to be known as the Pass Christian, Mississippi City, Handsboro and Biloxi Electric Railway, with the following officers: L. B. Moseley, president; W. L. Dinkins, vice-president; C. Phelps, treasurer. The company will get out a charter at once and build the road as soon as possible.

Fresno, Cal.—The people of this city are jubilant over the formation of a company to utilize the immense water power of the San Joaquin River and transmit it by electricity to all points in the valley. The capital of the new organization is $800,000, all of which has been subscribed. Besides furnishing power for their own establishments the projectors have in mind the acquisition of the street car lines of the city, which will be changed to electric lines and the system extended.

Philadelphia.—An electric locomotive of a new type has been completed at the Baldwin Locomotive Works for the North American Company, which operates the property of the Oregon and Texas Continental Company and extensive street railway and electric lighting interests in Milwaukee. This locomotive was designed by Sprague, Duncan & Hutchinson of New York, and it is intended for special experimental work in handling heavy freight and for switching purposes.

Seattle, Wash.—The formation of the Union Illuminating Company and their lease of the properties of the Union Electric Company and the Seattle Gas and Electric Light Company may be considered another victory for electricity over gas, as the Union Electric Company is the controlling party in the new combination. Dr. E. C. Kilbourne, general manager of the Union Electric Company, as we stated last week, becomes the general manager of the Union Illuminating Company.

Anderson, Ind.—The Clodfelter Gas Belt Electric Railway Company, which proposes to connect all of the Indiana gas belt cities with Indianapolis, was reorganized on the 26th ult. with $500,000 capital. Among the eleven stockholders are J. D. Lindsay and A. B. Wilson, Jr., of New York. N. J. Clodfelter is vice-president and general manager. It is stated that the contract for the construction and equipment of the line from Marcen to Anderson has been let to the New York Standard Construction Company.

Asbury Park, N. J.—Work on the new electric railway between Asbury Park and Pleasure Bay was begun last week. It is the intention of the promotors to push the work as rapidly as possible. The proposed trolley road from Atlantic Highlands to Long Branch is also likely to be constructed at an early date. Articles of incorporation have been filed with the Secretary of State, and the $25,000 guarantee has been deposited with the State Treasurer. This road will be known as the Atlantic Highlands, Red Bank and Long Branch Electric Railway.

Indianapolis, Ind.—The Indianapolis and Broad Ripple Rapid Transit Company has filed a mortgage in favor of R. T. McDonald and the State Street Deposit and Trust Company of Massachusetts. The mortgage is to secure $400,000 worth of bonds which the company will issue. With the mortgage was filed a warranty deed to 130 acres of land at Broad Ripple to the Indianapolis and Broad Ripple Rapid Transit Company. The deed was executed by R. T. McDonald and Lillie McDonald. The Broad Ripple Company will issue the bonds for the purpose of paying off its indebtedness and to make improvements this summer. The officers of the company say that $100,000 is to be expended in improving the street car track and in making it a double line. The company will also build a power-house.

Albany, N. Y.—The Railroad Commissioners have been applied to for permission to change the motive power on the White Line branch of the Troy City Railway between Cohoes, Green Island and Troy, from horses to electricity. The necessary consent of property owners along the line has been obtained.—A bill has been introduced in the Senate providing that the contract time for which the city of Albany shall be bound to pay for light shall be extended to five years. It also gives the contractors the right to supply electricity in every part of the city for light and power, thus giving them the free use of the streets for the extension of electric wires.—The State Railroad Commission has granted the Herkimer, Mohawk, Ilion and Frankfort Street Railway Company permission to increase its capital stock from $55,000 to $150,000, the increase being for the purpose of electrical equipment.

New York.—It is reported that the Widener-Elkins Traction Syndicate of Philadelphia had offered $4,500,000 for the "Huckleberry" system of trolley roads, north of the Harlem, and that the offer was rejected, the officials of the company valuing their roads and franchises at $5,000,000. A suit is now pending in the Supreme Court to test the constitutionality of the franchises under which this "Huckleberry" or Union Railway is now operating.—The Madison Square Light Company has mortgaged all its rights, privileges and franchises to the State Trust Company for $500,000, and the company has authorized its president and secretary to issue bonds to an amount not exceeding $500,000 to pay off the indebtedness incurred by the acquisition of the East River Electric Light Company.—In the construction of the "underground trolley road" on 109th street the management have substituted for the underground trolley wire a solid iron rail through which the current will be sent. The new device has been given a trial, and it worked so successfully that the directors of the road abandoned the old idea and adopted the new one.

Telephone and Telegraph.

A telephone line is in course of construction between Sioux Falls, S. D., and Dell Rapids.

The Lewis County Telephone Company of Canton, Mo., has been chartered. Its capital is $1,800.

The People's Telephone Company of Catlettsburg, Ky., has been incorporated. Its capital stock is $200.

Enough stock has been subscribed for at Emporia, Kan., to warrant the formation of a new telephone company.

An ordinance has passed the Salem, Ore., city council granting a franchise to the Anthony Telegraph Company of Oregon.

Cherokee, Minn., is to have a telephone, managed by a private company. The rentals are set at $2 per month for all instruments.

A home telephone company has been organized at Princeton, Ill., with over 100 subscribers. Nearly all the subscribers of the company are patrons of the Central Telephone Company and it is the intention to reduce rates from $48 per year to $15.

The Upper Peninsula Telephone Company, organized to operate in Marquette, Mich., under the franchise granted to B. S. Kaufman, have forwarded incorporation papers to Lansing.

The new Occoquan Woodbridge Telephone Company, who propose to establish an exchange in Alexandria, Va., in opposition to the Bell Telephone Company, are now busy soliciting subscribers and will shortly begin the erection of its line.

E. G. Edwards, representing the English Haley company of Kirksville, Mo., proposes to put in a telephone exchange at Whitewater, Wis., on the new automatic system and at low rates. A thorough canvass of the place will be made, and if sufficient encouragement is given a franchise will be asked of the common council.

J. M. Drill and Oliver Watson announce that they are forming a telephone company at Buffalo, N. Y., with a capital stock of $250,000. The organizers will guarantee to place telephones in business houses for $35 a year and in private houses for $30, with an unlimited service. They intend to introduce the inventions of the Mutual Automatic Telephone Company of New York.

Arguments of counsel in the Bell Telephone case, in which the validity of the Berliner patent on the telephone transmitter is involved, were closed several days ago in the United States Circuit Court of Appeals at Boston. It is likely to be some weeks before the decision of the court is made public.

It is stated that there is such a lack of harmony among the projectors of the Mutual Automatic Telephone Company of Philadelphia that a reorganization of the company has become a necessity. This is the company that was involved in the council scandal which went through the farce of an investigation a few weeks ago.

The Stillwater, Minn., Telephone Company has voluntarily reduced the price of telephones to $3.50 a month in business places instead of $4 and to $2 instead of $3 in residences.

At Des Moines, Iowa, long distance telephones are being placed in the daily newspaper offices, trunk line railroad offices and city offices, including the fire department and the police headquarters.

The Massachusetts House has rejected the bill to compel the Bell Telephone Company to pay a tax on shares of stock held in sub-companies. The House accepted the adverse report of the committee on mercantile affairs on the petition of J. J. Casey that telephone companies should be placed under the supervision of the Gas and Electric Light Commissioners.

A telephone exchange has been organized at Northfield, Minn., by Tennant Brothers. Sixty-five subscribers have been already obtained.

The defeat of the bill for cheaper telephone rates in the Legislature was a setback that can be only temporary. Competition will accomplish what legislation has denied.

The Citizens' Co-operative Telephone Company of Shreveport, La., is now fully organized, with John W. Taber as manager. The new company is meeting with such encouragement as to induce the belief that in time it will be a strong competitor of the Southern Telephone Company.

The Interstate Telephone Company has been organized at Wilkes-Barre, Pa., to build a telephone line connecting Wilkes-Barre, Pittston, Scranton, Carbondale and small towns between those places. The officers are: Hon. John Graham, Wilkes-Barre, general manager of the Wyoming Valley Traction Company, president; Timothy Burke, of Scranton, vice-president; Horace E. Hand, of Scranton, secretary and treasurer.

The city council of Chattanooga, Tenn., has granted a franchise to the Citizens' Telephone Company to establish a telephone system in that city. It purposes putting in telephones at a rate of $30 a year for business houses and $24 a year for residences.

The Harrison Telephone Company has applied to the city council of Detroit for a franchise. Attorney Charles Flowers, of the company, stated at a meeting of the Committee on Streets that the new company had already over 3,500 subscribers on its books, among them O. W. Shipman, who has subscribed for seven telephones.

Alpena, Mich., has a new telephone company composed altogether of its own citizens. The subscribers for telephones are also subscribers for stock.

Business men of Fort Wayne, Ind., have decided to form an independent telephone company. "The promoters," says the *Gazette*, "are men of means, and can secure abundance of capital to carry out their project, and they insist that the city will be given cheaper and better telephone service than it possesses at present, and and that, too, within a very brief period."

George S. Holmes has secured a telephone franchise at Pierre, S. D., and begun putting in a system there which he expects to extend to surrounding towns.

The Bell Telephone Company intend erecting a long-distance line between Huntsville, Ala., and Shelbyville, Tenn. The latter place is connected with Nashville, Nashville with Evansville and Evansville with Chicago. Then Huntsville will be connected with Atlanta, thus connecting Atlanta with Chicago, via Huntsville, a distance of over 900 miles.

The Ashland, Ky., *News* says: "The Keystone Telephone Company of Pittsburg, Pa., has written several parties locally about the prospects of the establishment of a new exchange here, but so far as can be learned they have not to date been accorded any very great amount of encouragement. The Keystone Company claim to have a system that is equal to any on the market and are willing to place the exchange at very low rates."

The Susquehanna Telephone Line, a company recently organized in Susquehanna, Pa., proposes to sell its 'phones to subscribers for $12, and will establish an exchange in that town when enough subscribers are obtained. The president of the company is L. G. Larrabee.

The Drawbaugh Telephone and Electric Company have made a propcsition to the citizens of Myerstown, Pa., offering to locate there if a specified amount of money be raised by the residents. At a meeting held for the purpose a large amount was subscribed.

More than $1,200 have been subscribed for a telephone line from Tallahassee, Fla., to Thomasville, Ga., via Bradfordville, Centerville, Duncansville and Surette. The line will be about thirty-six miles long.

The Gerst telephone bill, notwithstanding the fight that was made in its favor by the commercial organizations of the State of New York, has been killed for this session of the Legislature by the discharge of the committee on electricity. The probability of such an outcome was announced in this paper several weeks ago.

The stockholders of the Orange County Telephone Company at a meeting in Middletown, N. Y., on Tuesday of last week elected the following directors: L. S. Stivers, J. E. Iseman, J. L. Wiggins, A. B. Wilbur, F. M. Stratton, L. V. Sinsabaugh, R. C. Tuthill, G. A. Swalm, Jr., T. D. Mills, J. J. Silk, E. Fancher, Frank Harding, T. A. Weller.

A representative of the Harrison International Telephone Company is in Watertown, N. Y., securing subscribers. The company has been granted a franchise and part of the stock will be held by prominent business men of the city. The charge for the new telephone is $2 per month for business places and $1.50 for residences, just one-half the rates of the Bell Company.

The city council of Paris, Ky., has given the new Paris Telephone Company a ten-year franchise, and the company will begin at once to erect its poles and make connections with the outside world. H. A. Power is president and Dr. H. Roberts secretary and treasurer.

A representative of the Stromberg-Carlson Telephone Manufacturing Company has proposed to business men of Morris, Ill., to introduce a system in that city on the basis of a local stock company to which he will furnish the instruments, and it is thought that in this way business houses can be accommodated at an expense of $18 or $20 a year, while residence 'phones will cost but $12 or $15. Marseilles, Ill., has gone into the scheme and has many subscribers.

The council of Winterset, Iowa, has passed an ordinance granting H. J. B. Cummings, Fred Strong, Dr. Hinshaw, C. C. Schwaner and T. Mardis and their assigns the exclusive right to use the streets and alleys of Winterset for telephone purposes for the next ten years. This ordinance, as locally construed, prevents the old company from soliciting further business in Winterset, and restricts it to the instruments already in.

The Merritt Lamp.

A patent has recently been issued to Mr. Charles Andrew Merritt for an incandescent multi-filament lamp which will be readily understood by the following description:

The lamp is made with three or more filaments; they may all be of the same candle power or have different degrees of illumination; each one is to be used separately, or two or more of them can be used at the same time in multiple arc. One terminal of the carbons is attached to a contact post in the base of the lamp, the other leading-in wires are attached to the outer shell for a return contact. The contact posts for each filament are insulated from each other and are touched by a switch shown at L, Figs. 1, 2 and 4, which also forms a contact with the key in the socket. There is no change necessary in the socket from present construction. By placing the pointer end or switch on any contact post the carbon connected with it will be lit up, or by

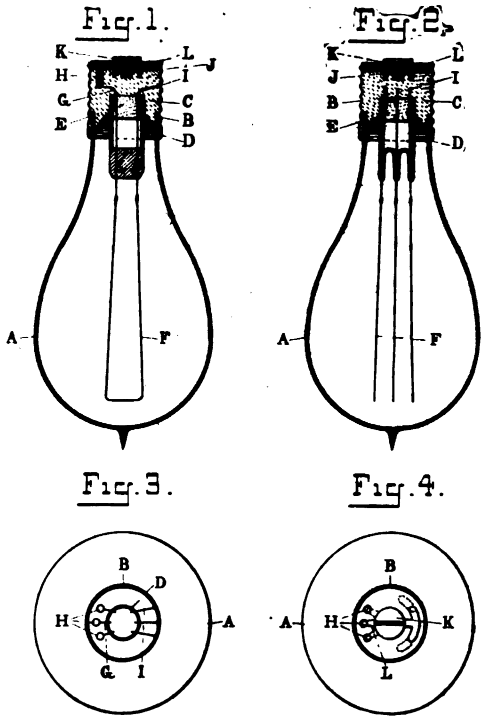

Fig. 1. Fig. 2. Fig. 3. Fig. 4.

The Merritt Lamp.

turning the broad end around one or all may be lit up.

It would seem that this lamp could be made at a slight additional cost and would be a great saving to the consumer.

Probably the true way to use this lamp would be to burn each carbon for about 300 hours; four filaments would thus give 1.200 hours' continuous use at a comparatively small loss of brilliancy. While each filament might drop 10 to 15 per cent. in burning, every time a fresh one is started it would bring up the lamp to full candle power; that is to say, in using the lamp before the globe becomes smoked enough to obscure the light the initial brilliancy will be restored as many times as there are extra carbons to use.

THE FORT WAYNE ELECTRIC CORPORATION'S NEW MULTIPOLAR DYNAMO.

Figure 1 of the accompanying illustrations represents a new 60 K. W. medium speed dynamo designed for incandescent lighting or power. It is the first of a series of multipolar dynamos designed by Mr. James J. Wood, the Corporation's electrician and mechanical engineer, which vary in size from 25 to 800 kilowatts. As will be seen from the figure, the design of this dynamo, like all of Mr. Wood's apparatus, presents a very beautiful and substantial appearance, while the mechanical perfection of detail, workmanship and finish stamps it at once as a modern high-grade machine. In the several sizes up to and including 120 kilowatts, the lower portions of the field, pedestals and base are made in a single casting, while in the larger sizes, which have an outboard bearing, the parts are cast separately and bolted to the base, making the dynamo easier to install, as should the same design be maintained throughout, the castings would become very heavy and difficult to handle. A notable feature in this Generator is the absence of all loose cables, wires and connections, so common on most machines, the connections in this dynamo being made by removing the perforated door, where they connect with the main binding-posts, which are mounted on slate bases at each side, effectively protecting them from dirt or injury. The two small binding-posts shown in front are for the field rheostat connections. The dynamo is compound wound and can be run in either direction by simply reversing the brush-holders on the studs and without changing any of the other connections, the brush-holders being so proportioned with relation to the commutator that the act of reversing them on the stud changes the point of contact 90 degrees, leaving them in the correct position for commutation when the dynamo is run in the opposite direction. The curved pedestal on the commutator end is also a decided advantage, as it not only reduces the floor space and weight of metal required in the base, but enables the dynamo to be turned end for end on the sub-base should it be required to belt from either end. The bearings are self-oiling and aligning and are of ample proportion to withstand the strains to which they are subjected, while the field coils are wound on steel spools with brass heads, making them very easy to replace in case of an accident.

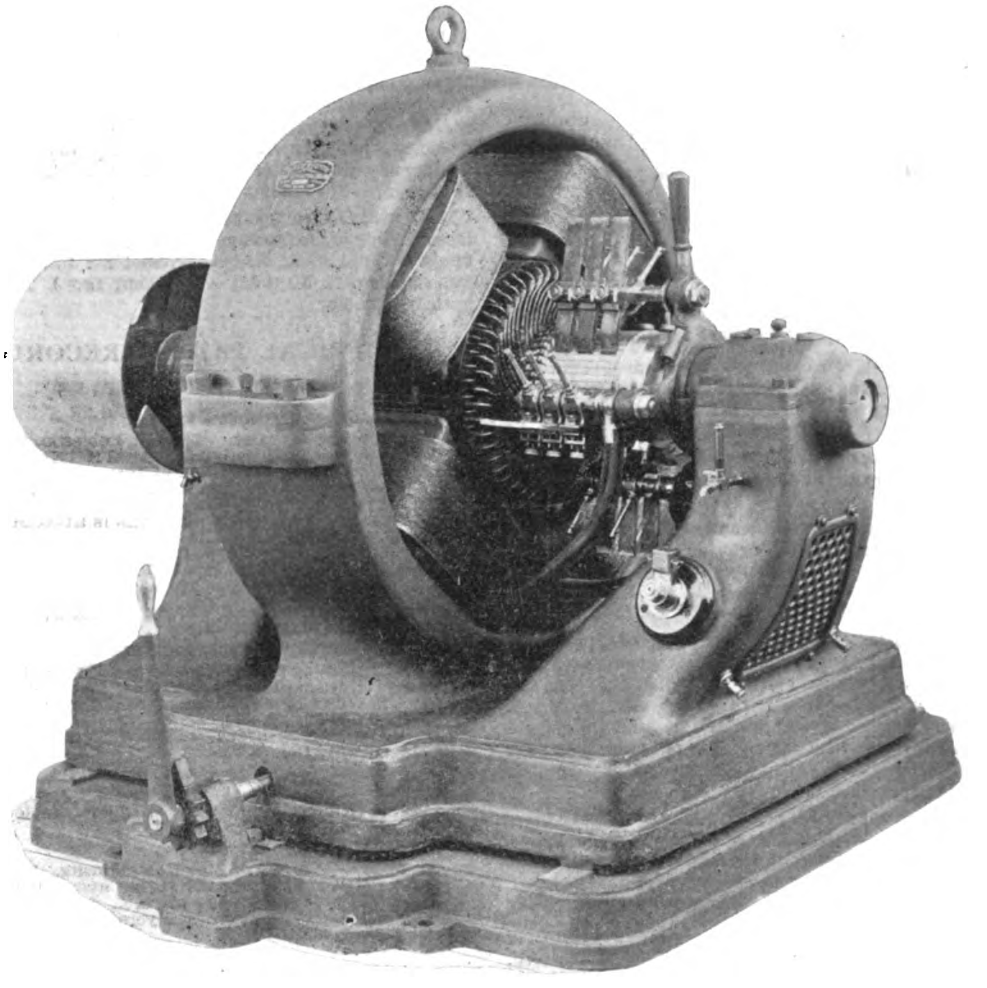

FIG. 1.—"WOOD" 60 K. W. DYNAMO.

The armature construction of this dynamo (Figs. 2 and 3) possesses many novel features, showing in a marked degree the ingenuity and originality of the designer. Fig. 2 shows the commutator and core complete with one of the coils in place, while Fig. 3 shows one of the armature punchings, the method of building up the core, and one of the coils before being insulated. As will be seen from Fig. 3, the armature core is constructed from segmental punchings, having hooks projecting from the inner edge which partly encloses the clamping bolts. These punchings alternate with one another in order to break joints, the hooks making contact with the bolts on opposite sides but without completing the magnetic circuit around them. It will be seen from this construction that the several segments are self-supporting, there being no strain on the spider or bolts other than that produced by the torque. As a consequence the spider can be of exceedingly small cross section and in marked contrast to the heavy cast-iron or steel structure so common in other multipolar machines, while the labor of fitting is reduced to a minimum, there being no dovetails or other difficult fits to make. The hooks, which engage with the clamping bolts, not only break joints, but alternate in position, leaving spaces between each equal to the thickness of the iron punchings. These hundreds of spaces enormously increase the radiating surface of the core, which of course reduces the temperature.

A careful set of tests show that with this construction there is absolutely no current generated in the clamping bolts or spiders. Its advantages may be summed up in the following terms:

1. Minimum weight of armature,
2. Enormously increased radiating surface,
3. Self-supporting core construction,
4. Simplicity of spider construction,
5. Economical use of sheet iron,
6. Small cost for punching dies and their maintenance,

—this method adapting itself perfectly to armatures of large diameter, and any capacity required. Those wishing a more detailed description of this construction are referred to Mr. Wood's patent, No. 529,437, of November 20, 1894.

The windings or coils which compose the armature circuit are also of novel construction, and present features of extreme simplicity over the bar method of winding heretofore employed. As will be seen from Fig. 3, the coil is composed of four bare wires wound on a former with a heavy copper connector soldered at one end, which makes connections by screws to the commutator segments. The advantages of this construction are: First, the soldered joints so common in bar winding at each corner, with their tendency to get loose, are entirely dispensed with, there being but one soldered joint to each coil, in place of five in the old method. Second, as a consequence, the resistance of a turn, and the $C^2 R$ losses in the armature are materially reduced. Third, the four naked wires of which the coil is formed present a greater radiating surface in proportion to their area, and consequently carry the currents generated in them at a much lower temperature.

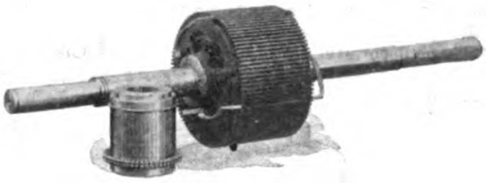

FIG. 2.—ARMATURE CORE AND COMMUTATOR.

After being formed in shape as shown in Fig. 3, they are then carefully insulated and placed in position on the core as shown in Fig. 2, the return ends being soldered into holes in the commutator connector before referred to. The commutator is then slipped on the shaft, each connection being screwed to its proper segment by two screws. As there is no strain anywhere on the insulation, and as the voltage between each turn is very low while the ventilation is perfect, it would seem as though such an armature ought to last forever.

The commutator of this machine, shown separate in Fig. 2, is constructed from hard drawn copper with mica insulation, put together by hydraulic pressure, and both it and the brushes and brush-holders are of ample cross section for the currents which the dynamo is intended to generate, and as a consequence it does not heat. The armature circuits are so arranged and connected that either two or four sets of brushes can be used on the commutator; either set can be removed while the dynamo is running and the remaining set will carry the current without over-heating. On a recent test this dynamo was run on a load of 525 amperes at 120 volts for ten hours after which careful temperature readings were made. It was then found that the highest temperature in any part of the dynamo was but 35 degrees C. above that of the room.

The dynamo weighs complete 7,300 lbs., while the armature complete weighs but 950 lbs., and at a speed of 650 revolutions per minute delivers 500 amperes at 120 volts, which can be raised to 140 when required.

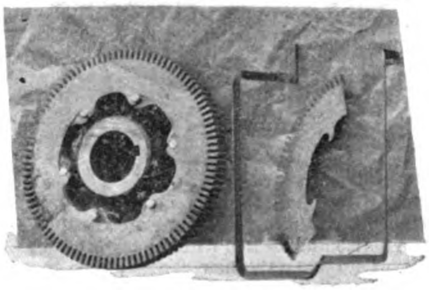

FIG. 3.—DETAILS OF ARMATURE CONSTRUCTION.

COMMERCIAL PARAGRAPHS.

The Metropolitan Electric Company have placed on exhibit in their store a sample board, showing a very complete assortment of pliers, splicing clamps, vises, etc.

The Central Electric Company of Chicago have issued Catalogue No. 15, giving full particulars as to the large line of Lundell Fan Motors which they carry in stock at all times.

The Siemens & Halske Electric Company are sending out an open letter to customers giving strong arguments for the superiority of the direct-current low-tension system of lighting over all others.

The Interior Conduit and Insulation Company's Catalogue of 1895 models of Lundell Fan Outfits is now ready. It contains among other desirable matter a price list on separate parts which may be needed.

The New York office of the American Electrical Manufacturing Company, formerly in the Havemeyer Building has been removed to 39 Cortlandt street.

The Metropolitan Electric Company have made a new departure by establishing a bargain counter on which can be found a complete line of useful devices at hard-time prices. It will be well for the trade to inspect these goods before placing their orders.

A. L. Hawley, formerly assistant manager of the Union Electric Company of Seattle, Wash., is now superintendent and purchasing agent of the new Union Illuminating Company of Seattle, and will be in the market for stock of supplies, both electric and gas, and gas stoves, during June and July. His address until June 1 will be Seattle, and after that date, catalogues, etc., can be addressed to him at 1,255 Wabash avenue, Chicago.

Special Decorative Incandescent Lamps.

The Columbia Incandescent Lamp Company are placing on the market some special incandescent lamps, very suitable for decorative purposes.

Figure No. 1 represents the full size 16 candle-power coiled-filament round-bulb incandescent lamp, which is made in high voltages and is very suitable for window and ceiling decorations. The lamps are capable of being used in a horizontal position without any drooping of the filament. They maintain their candle power to the high degree of the new type Columbia incandescent lamps in high economy, and give a very pretty effect either clear or in ground glass.

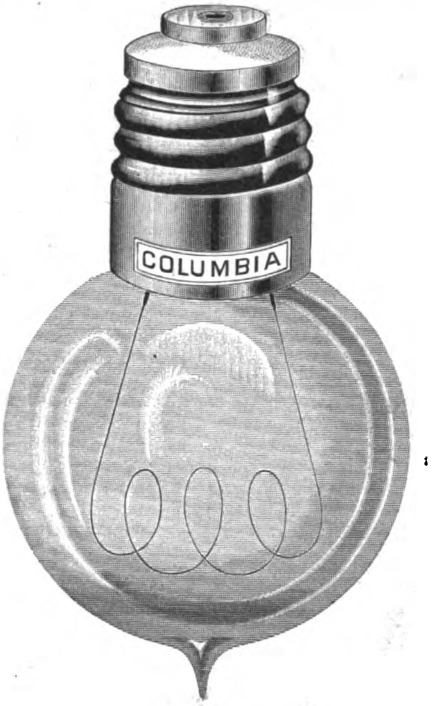

FIG. 1.

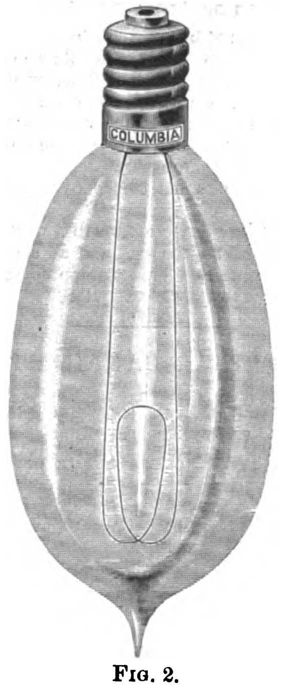

FIG. 2.

Figure No. 2 represents a special candelabra lamp, which is suitable for burning in series on 100 volt circuits and upwards. These lamps, used with the small yellow and red silk shades, make a very pretty and harmonious effect.

In More Commodious Quarters.

The Metropolitan Electric Equipment Company has moved from 10 and 12 Chambers street, New York, to more commodious quarters at 44-46 Duane street. This company, which has acquired the distinction of producing the most striking and artistic effects in Decorative Lighting, has on hand a large number of contracts in this field. Mr. C. Colombani, the skillful and artistic originator of the decorations, has in preparation some designs which promise to surpass, in point of beauty and effect, the many and remarkable creations he has already produced in this line.

INCORPORATIONS.

The Hobart and Western Electric Railway Company, Hobart, Ind. Capital stock, $50,000. Promoters: Alfred Morrison, Andrew J. Smith, Geo. Stoker, Seward Lightner.

The Great Western Electric Company, Des Moines, Iowa—to manufacture all kinds of electrical machinery, appliances, appurtenances and supplies. Capital stock, $500,000. Promoters: Warren A. Drake, Riverside, Ill.; L. F. Dyrenforth, Riverside; Ralph H. Smith, Evanston; T. C. Sullivan, H. K. Gilman, Chicago; C. E. Hunn, Des Moines, Iowa.

The Delaware County Electric Company, Chester, Pa—to supply light, heat and power by means of electricity. Capital stock, $1,000. Promoters: S. T. Wellman, Upland, Pa.; W. C. Gray, O. B. Dickinson, Chester.

The Baird Electric Conduit Company, Chicago, Ill.—to build, equip and operate street railroads operated by horse, steam, electric or other power; deal in street railroad and railroad appliances, material, supplies, etc. Capital stock, $5,000,000. Promoters: F. C. Baird, Geo. E. Baird, W. H. Craig.

The Electric Porcelain and Manufacturing Company, Trenton, N. J.—to manufacture every kind of porcelain insulating devices for electrical purposes. Capital stock, $50,000. Promoters: Carl F. Adam, Ferdinand F. Wachter and David Crossley, Trenton, N. J.

The Northern Waterworks and Power Company, Beresford, S. D.—to build, operate and maintain waterworks plants, electric plants and milling plants. Capital stock, $75,000. Promoters: J. L. Potter, Beresford, S. D.; C. O. Potter, Elmira, N. Y.; F. H. Potter, Mellette, S. D.

The Big Four Electric Company, Chicago—to manufacture electric apparatus. Capital stock, $200,000. Incorporators: William H. Brown, Louis K. Gilson and Henry G. Ames.

The capital stock of the Pasadena (Cal.) Electric Light and Power Company has been increased from $50,000 to $100,000.

The Asbury Park Electric Company, Asbury Park, N. J.—to furnish electricity for light, heat and power, etc. Capital stock, $200,000. Promoters: George A. Smock, Jas. M. Ralston, John W. Rockafeller, Harry J. Rockafeller, Asbury Park.

The Automatic Telephone Company of Wisconsin, Chicago, Ill.—to maintain and operate telephone exchanges, and to furnish telephone service as well as telephone and electric lighting and power, to furnish electric wiring, erect telephones and their accessories and do general telephone and electrical business. Capital stock, $500,000. Promoters: J. Harry Theobald, Wm. Thos. Whipple, Maurice Rosenfeld.

The Lafayette Machine, Electric Light and Power Company, Denver, Col.—to conduct a machine shop for manufacture and repair of electric fixtures and generate electricity for light, heat and power. Capital stock, $10,000. Promoters: John S. Spencer, Frank D. Taggart, Henry Jay Mayham, of Denver, Col.

The Wadsworth Electric Railway Company, Wadsworth, Ohio—to build railways to be operated by electricity or horse power, construct and operate telegraph and telephone lines, furnish electric light, heat and power. Capital stock, $10,000. Promoters: F. G. McCauley, W. A. Ault, O. V. Dibble, R. F. Weaver, Frank Mills, W. S. Holloway.

The Wayne and Conshohocken Street Railway Company, West Chester, Pa.—to construct and operate a street railway. Capital stock, $30,000. Promoters: Francis Fenimore, St. Davids; Richard H. Johnson, Julius A. Bailey, Wayne, Pa.

The Rockland Telephone and Telegraph Company—to construct and operate telephone and telegraph lines from Nyack to Montmoor, to Hillburn and Ramapo; Montmoor to New City, to Congers, to Rockland Lake and to Haverstraw, N. Y. Capital stock, $8,000. Directors: William R. Thompson, Frank L. Colgrove and William Dewey, of Nyack; John I. Traphagen, of Suffern; G. A. Blauvelt, of Monsey; A. A. Demarest, of West Nyack, and L. H. Hutton, of Nanuet.

The Vance Electric Company of New York City—to carry on a business of general contractors and electrical engineers for all classes of electrical construction work. Capital stock, $10,000. Directors: Arthur S. Vance, of Brooklyn; John H. Cheever, Elizabeth Cheever, Charles C. Guiteau, of New York City, and Charles A. Allen, of Dover, N. J.

The United Electric Telephone Company of New York City. Capital stock, $50,000. Directors: Norman C. Raff, Frank R. Gemmon, Henry C. Williamson, Albert L. Richardson, Charles P. Rowland, Henry A. Tobb and F. C. Toepleman, of New York City.

The Harvard Telephone Company, Harvard, Ill. Capital stock, $2,500. Incorporators: John C. Blake, John F. Reham, Herbert D. Crumb.

The Stromberg-Carlson Telephone Manufacturing Company, Chicago—to manufacture telephones. Capital stock, $50,000. Incorporators: Alfred Stromberg, Androy Carlson and Arthur B. Cotton.

The Nunda Electric Light Company, Nunda, Ill.—to operate an electric light plant. Capital stock, $5,000. Incorporators: E. G. McCollum, H. H. McCollum and E. E. McCollum.

The Mount Vernon Telephone and Messenger Company—to operate a line of electric telegraph or telephone to connect the towns, villages, cities or other places within the County of Westchester, N. Y. Capital stock, $40,000. Directors: Horace Granfield, C. H. Ostrander, F. T. Davis, G. H. Gray, John Dawson, John Berry and William Archer, of Mt. Vernon, N. Y.

The Westchester and William's Bridge Traction Company—to operate a street surface electric road between the villages of Westchester and William's Bridge, N. Y. Capital stock, $60,000. Directors: G. P. Morgan; A. G. MacDonnell, and Charles F. Tracy, of New York City.

The Toledo Electric Street Railway Company of Toledo, Ohio, has increased its capital stock from $1,400,000 to $1,750,000.

The Cambridge and Guernsey Consolidated, Chicago, Ill.—to prosecute mining, produce and market coal, salt, gas, oil and electricity for all purposes; buy and sell merchandise; build an electrical light plant for lighting, heating or power. Capital stock, $200,000. Promoters: U. S. Frye, C. N. Crandle, Walter J. Hammond.

The Kitsee Electric Company, Camden, N. J.—to manufacture dynamos, motors and electrical contrivances of all kinds. Capital stock, $75,000. Promoters: Jno. M. Carroll, Camden, N. J.; Robt. A. Balfour, Leo J. Tierney, Philadelphia, Pa.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED APRIL 16, 1895

ELECTRIC RAILROADS AND APPLIANCES.

537,857. Electric-Motor Car. William Robinson, Boston, Mass. Original application filed April 12, 1889. Divided and this application filed Jan. 16, 1890.

538,005. Electric-Railway. Conrad C. G. Wolpers, Brooklyn, N. Y. Filed Oct. 2, 1894.

538,104. Electric Motor for Railway Cars. Charles E. Emery, Brooklyn, N. Y. Filed April 19, 1894.

538,158. Electric Railway System. James M. Faulkner, Philadelphia, Pa. Filed Jan. 12, 1895.

ELECTRIC LIGHTS AND APPLIANCES.

538,023. Electric-Arc Lamp. Frank M. Lewis, London, England. Filed Oct. 12, 1894.

DYNAMO ELECTRIC MACHINERY.

537,994. Controlling Mechanism for Electric Motors. Charles H. Richardson, Philadelphia, Pa., assignor to the S. S. White Dental Manufacturing Company, same place. Filed June 9, 1894.

538,097. Commutator-Brush. Louis Boudreaux, Paris, France. Filed Oct. 28, 1892.

TELEPHONE AND TELEGRAPH APPARATUS.

537,967. Telephone System. William Coonan, Jersey City, assignor to himself, and Wm. A. Childs, Englewood, N. J. Filed Aug. 4, 1892.

BATTERIES.

537,989. Storage-Battery. Morris Moskowitz, Newark, N. J., assignor, by direct and mesne assignments, to himself, Leon D. Adler, same place, A. S. Adler, Philadelphia, Pa., and Theodore W. Myers, New York, N. Y. Filed May 7, 1894.

MISCELLANEOUS.

537,829. Electric Alarm-Clock. Henry W. Knapp and Lawrence E. Gerrety, St. Paul, Minn. Filed Oct. 25, 1894.

537,855. Electric Appliance for Elevators. James H. Roberts, Grand Rapids, Mich. Filed Oct. 6, 1894.

537,856. Electrical Appliance for Elevators. James H. Roberts, Grand Rapids, Mich. Filed Feb. 23, 1895.

537,860. Electric Guest-Call. Frank O. Smith, La Crosse, Wis. Filed June 2, 1894.

537,876. Rheostat. George H. Whittingham, Baltimore, Md. Filed Dec. 11, 1893. Renewed Sept. 27, 1894.

537,907. Rosette or Ceiling Cut-Out. Eugene A. Snow, Syracuse, N. Y., assignor to John R. Owen, same place. Filed Sept. 21, 1894.

537,920. Coupling for Electrical Connections. James M. Faulkner, Philadelphia, Pa. Filed Aug. 9, 1894.

537,932. Method of and Apparatus for Protecting Electric Circuits. John M. Oram, Dallas, Tex. Filed Jan. 15, 1895.

538,020. Insulated Conductor. William M. Habirshaw, New York, N. Y. Filed Oct. 16, 1894.

538,024. Electric Brake. Edward D. Lewis, Savona, N. Y. Filed Dec. 7, 1894.

538,064. Fastening for Non-Conducting Coverings. Philip Carey, Cincinnati, Ohio. Filed July 21, 1893.

538,083. Separable Terminal for Conductors. David N. Osyor, Columbus, Ohio, assignor to Joseph A. Jeffrey, same place. Filed Nov. 28, 1893.

538,090. Electric Cut-Out. Herbert A. Wagner and Ferdinand Schwedtmann, St. Louis, Mo. Filed Jan. 5, 1895.

538,127. Electric Door-Opener. John Schneider, Long Island City, N. Y. Filed May 7, 1894.

538,132. Electrical Igniting Device for Gas-Engines. Alfred J. Signor, Elkhart, Ind. Filed March 26, 1894.

538,224. Automatic Cut-Out System. Lewis L. Borradaile, Philadelphia, Pa., assignor of one-half to Joseph C. Borradaile, same place. Filed Feb. 5, 1895.

ELECTRICITY.

VOL. VIII. NEW YORK, MAY 8, 1895. NO. 17

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER CO.
B. E. GREENE, PRES'T. L. J. MONTGOMERY, SEC'Y.

PUBLICATION OFFICE:
6 Park Place - New York

EDITORS: NELSON W. PERRY.
BURTON E. GREENE.
R. H. WILLOUGHBY.

BUSINESS MANAGER, - - JOHN L. GANS.

SUBSCRIPTION RATES:

UNITED STATES,	$2.50
IN CLUBS OF FIVE OR MORE,	$2.00
FOREIGN COUNTRIES,	$4.50
SINGLE COPIES,	10 CENTS

ADVERTISING RATES:

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.

Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

ENTERED AT THE N. Y. POST OFFICE AS MAIL MATTER OF THE SECOND-CLASS.

TRADE SUPPLIED BY
THE AMERICAN NEWS COMPANY,
THE WESTERN NEWS COMPANY,
And their Agencies in all Principal Cities.

EDITORIAL NOTES.

The Right Will Win.

To many of our readers it may seem entirely superfluous to call attention to the peculiar conditions of the electrical trade as distinguished from other industries, and to point out that just such a course as has been pursued by this paper was, and is, not only justifiable, but essential to the very life of the industry. But while the progress of events has made it clear to a few of the more advanced thinkers among the thousands directly or indirectly interested in the business that, with all its disagreeable features, such a vigorous campaign against wrong, and against the individuals responsible for or typifying the wrong, is for the general good, there are many, especially of the distinctly professional class, who have looked upon our policy with disfavor, and who, while not denying the existence of the evils which we have laid bare, have held that a policy of silence and tolerance would have been better, and that the wrongs would have righted themselves without the disgrace and humiliation which have resulted from their complete exposure.

The fact that ELECTRICITY was the only one of the trade papers to take hold of the subject with vigor, to expose trade abuses and those responsible for them, has apparently strengthened this view of the situation.

Those who have been of this opinion, however, have failed, we think, to consider the subject in its full breadth and depth. The fact that our contemporaries have not printed one word to aid the right and to wipe out the wrong proves, not that they do not see the wrong, but that they are governed by a short-sighted policy and are afraid to attack the vampires in the art because those vampires have had money to spend in advertising. This is the case in a nutshell as regards the older journals. The heads of every one of them admit in private conversation that the trade is in danger, that the source of that danger lies chiefly in those great corporations which have no other idea of business than the ruin of competitors and the robbery of the investing public.

The narrow view of the case that the evils which exist are inevitable and must be endured is not tenable. They are not inevitable, and need not be endured forever. The trade *can* be cleared of the parasites; the handicap *can* be removed; the electrical industry *can* be placed on an even basis with the other great industries of the world. While in our social life petty deceits and misrepresentations are looked upon without serious criticism by most of us, and accepted as incurable, the policy of misrepresentation and deceit should not and can not be tolerated at all in large enterprises such as the one we are interested in. In the electrical business, as in railroads, etc., millions of money are invested, chiefly the money of the middle classes—small investors, ignorant of the business, and confiding in the representations made by those who know more. The lines upon which the large corporations have been conducted, the gross mismanagement, the continued robbery of the many to enrich the few, have killed all confidence in the solidity of the industry, and have worked great injury not only to the innocent investors but to the very industry itself.

We hold with greater confidence than ever before that ELECTRICITY has shown from the first abundant reasons for existence, for claiming the support of every honest man directly or indirectly interested in the business and looking to that business for his living or for profits upon investments. Yet many of those who are supposed to mold public opinion have looked askance at our work, questioned our good faith and doubted the good effect of such a crusade.

We shall yet demonstrate to all the skeptics and to the world at large that in our fight we have been at all times right, and that we are entitled to great credit for a work which should have been carried on at least in part by the other trade journals. We stand by our guns, and *shall stand there*, aiming at what we know to be wrong in whatever corporate or individual name it may appear, just as certain as we are of our own existence that sooner or later the sober judgment of the entire trade will give to us more credit for work done in the interests of the art than is extended to any or all of our contemporaries. And we shall not have long to wait.

We adopted, after careful consideration, a policy which we know to be sound, not only from the newspaper standpoint, but which is for the best interests of everyone represented in the trade in any honorable capacity.

It may be that before the fight is ended not only the G. E. Company but other companies will be driven into bankruptcy. So. Their legitimate businesses will not be ruined, the stockholders will not be injured but benefited, as will also be the entire industry and the large investing public. The businesses will go on, but the coteries of speculators who have become interested in this art only to its bedevilment will be forced out. This is our single aim, and when the result is achieved, the incubus removed, general prosperity will come immediately, capital will come in again, and the first step will be taken towards a solid foundation for a great and profitable industry. Such a foundation has never been built, and it will not be until the speculators and robbers have been driven out.

The electrical business, or that part of it developed to such a marvellous extent by the earnest technical workers in the last fifteen years, has, by its very magnitude and opportunities for profits, attracted to it men of various stripes of character. They may be divided into two general classes. Of course minor classifications or subdivisions might be mentioned, but for the purposes of this article the two general classes are sufficient.

The first class includes the *producers*--those who have contributed by their efforts to the general welfare of the race, who have originated and worked out ideas which have added to the world's wealth, assisted in the amelioration of the harsher conditions of life—have made in fact life better worth the living. These producers are not only those who have labored with their hands, but those who have used the brains with which they were endowed, and the class may justly be said to include the business men who worked along legitimate lines hand in hand with the inventor to perfect improvements and place them within reach of the people at large, rich and poor.

The second class embraces those who have not been producers in any sense of the word, but who have come into the business with the sole object of taking advantage of the work of others and turning that work to their own financial benefit, regardless of the rights of others. They are the men who contribute nothing to the world's wealth, but who succeed only in re placing the bank accounts, transferring the savings of the workers to their own pockets.

The number of persons who belong in class 1, those who have contributed to the development of the art by honest effort, is very large, though those who have become *prominent* for working out the various difficult problems is comparatively small. And every man who has assisted by his labor in the perfection of necessary devices is entitled to some measure of credit and to his share of the commercial rewards. Not one in ten of these men is getting to day any appreciable share of the reward to which he is entitled, and chiefly for the reason that the parasites of class 2 have appropriated the results to their own benefit.

Class 1 has utilized the hitherto unknown or unused forces of nature to the public good; class 2 has substituted for genuine ability a low order of cunning and knavery, stolen the work of the former, disgraced the industry and brought it to the verge of wreck.

Every new industry offers inducements and attractions to a class of people who have never made an honest living or by the exercise of their faculties contributed to the advancement of the human race, and also to a more dangerous class who have conducted orderly and respectable businesses with a fair measure of profit, establishing a good reputation, and who are thus prepared to successfully deceive the public when they enter, as many did in the electrical line, upon a career of stockjobbing and public plunder. The history of the world's business, however, furnishes no parallel to this trade in the number of such persons who were attracted, and who have succeeded by hook or by crook in freezing out the more conservative and in debasing the industry.

The *producing* class have never, with perhaps few exceptions, endeavored to force the sale of unfit apparatus upon the consumer by misrepresentations, and to the subsequent injury not only of the purchaser but also of the whole trade. Not so class 2, the members of which have had no scruples in this respect, but have foisted upon the central station men, the railroad companies and the public generally anything and everything in the shape of apparatus, regardless of whether it was of any actual value and utility or not. The methods adopted to do this are already well known, but have not been sufficiently impressed upon the public which has been so wronged. To find this out more clearly will be the important work of ELECTRICITY in the future.

The temporary success of this vicious policy was made possible by the dense ignorance which prevailed in the early days, and which has not yet disappeared altogether, of everything connected with the art. Even the so-called teachers of the period showed small understanding of the underlying principles.

It has been the desire of ELECTRICITY to clear up the entire situation, to show who were the enemies of the industry and who its friends. When one group has been disposed of, the others will follow quickly. They are not confined to one corporation. While they might disappear eventually in the regular order of things, the present condition of the trade shows that, left to themselves, they would outlast the present generation and bring the whole business to complete wreck. Our children might re-establish a solid business, but the legitimate rewards would not come to the army of thousands now here. To hasten this cleansing process nothing could be more effective than a newspaper campaign such as we have made. Our policy has been for the best interests of every honest worker.

There has been enough money made in the manufacture and sale of apparatus to have made a competency for every one engaged in it. No other trade or industry has contributed so largely to the general welfare of the world. The world has been willing to pay for the benefits conferred. It has paid for them. But the cormorants of class 2 have stepped in between the public and the producer and robbed both, so that instead of a successful business industry, what do we see? an unstable discredited trade, with the rank and file making a bare living, struggling along in hopes of better times, and scarcely realizing the forces which have brought them where they are.

ELECTRICITY'S mission is to help them to see and to remedy the evils.

Millions have been made as the fruit of honest labor, and those millions have been squandered in rascally schemes and gross mismanagement. Class No. 2 has not only stepped in to rob the legitimate worker of his reward, but has used that work for purposes of further robbery in swindling the investor.

Nothing can be more certain than that without ELECTRICITY'S early exposures the G. E. Company would have had at least temporary success in their campaign of extermination.

Their first point of attack was not their competitors (except in the incandescent lamp field) but the consumers. Their first policy towards central stations and other large customers was that of the highwayman. This policy was partially shown in the preparation of Contract Form D. The agents went to the central station man and laid bare to him the weakness of his condition, and this weakness did not need to be exaggerated. The agent said: You have a plant covering so much territory and having cost so much money, and you sell so much current. Now we are in position to dictate terms. We do not care to go into the lighting business in your town, but we must supply the apparatus and supplies. Give us a five or ten year contract at our terms and we will get along together without trouble. If you refuse to give this contract, we will come into the field ourselves; we can build a new station at half what yours cost, and do better work.

Nothing prevented the success of this plan so much as the growing knowledge of the weakness of the G. E. Company itself. It did not take long for the central station people to find out, through the columns of ELECTRICITY, that the great attempted monopoly was only a rotten shell, and that a degree of backbone on their own part was all that was needed.

As certain as the sun rose in 1892 ELECTRICITY prevented the G. E. organizers from issuing the remaining $20,000,000 of unissued stock—and if they had got that additional money there would not have been enough of the independent element to-day to make a respectable funeral procession for those who had died.

The stand and-deliver policy failed, and now we have a new one with the same object in view, to wit, the sale of apparatus and supplies for less than cost. It is now the intention to trust to financiering schemes to carry the G. E. Company along while they are losing money on every dollar's worth of product sold, until their competitors shall one by one be forced to the wall. That this policy is already meeting with some success is in evidence. That further success awaits it is certain, unless the independent manufacturing and selling companies realize their danger, combine for common defence, and sustain papers which have the disposition and the power to protect them.

Unless the STOCKHOLDERS of the G. E. Company can be reached and informed of the iniquitous, even criminal, abuse of position on the part of the management, that management will hang on long enough to create unlimited trouble and disaster from which not one independent concern in ten can recover.

ELECTRICITY proposes, therefore, at great expense, and with thoroughness, to conduct from now on an educational campaign. The first object lesson will be a complete history of the Northwest General Electric Company that will run through several numbers. And if those responsible for this company's condition are not landed in the penitentiary through our disclosures it will be because the swindled preferred stockholders and others refuse to make use of the documentary evidence which we shall present. We believe it to be of supreme importance to show to the stockholders of the G. E. Company that their interests are being managed by criminals and for purposes of criminal robbery.

What ELECTRICITY has done is on record, but the record is not completed. When it is, those who now criticise or withhold their support will be proud to do homage to the paper which knew the right and was not afraid to fight for it. We need the support of the trade, but the trade needs us far more. We claim that support as our right and will yet have it in fulness.

In future articles we shall give many specific instances, as we have in the past, in support of the position here taken. We shall take up the affairs of more than one company, and show conclusively to any intelligent man that exposure of all the rottenness, though unpleasant, is essential to the purification of the business, and that until this rottenness is uncovered, and cast out, there will be no improvement in conditions, no room for any honest man or company to make money.

No injustice has been or will be done by ELECTRICITY. We know that we are right, and we shall continue until the cause of the right in the electrical industry of America has fully triumphed over wrong.

This is the keynote of the entire conflict—THE RIGHT AGAINST THE WRONG.

* * *

Ewing's Magnetic Tester for Hysteresis.

To Prof. J. A. Ewing more than to any other man are we indebted for the present state of our knowledge of the magnetic properties of iron. Several of what have proved to be the most important properties are in fact his own discoveries. With the advent of the alternating current methods of distribution came the transformer, or rather might it more truly be said that with the advent of the transformer came the commercial alternating current.

This involved a study of the magnetic properties of iron under practically new conditions, viz., under conditions of rapid reversal. It had been noticed that there was a retardation of the magnetizing or demagnetizing effects as regards the causes which produced them—a *lagging behind* of the effect after its cause. Ewing first quantitatively studied these effects and gave to them the name hysteresis, from ’υστερεω, the Greek verb meaning "to lag behind." He found that in a complete cycle of magnetization, i. e., when magnetizing a piece of iron in one direction and then demagnetizing it, and then magnetizing it again in the opposite direction, and finally bringing it back again to its original condition, a definite amount of energy was expended which was dependent upon the quality of the iron and its previous history. The energy thus expended appeared as heat, and was not only a total loss as regards the final useful results, but where carried too far became destructive of the insulation of the surrounding coils. Prof. Ewing mapped out the hysteresis curves of an immense number of specimens of iron of different grades, and thus made the world familiar with the generic characteristics as regards hysteretic losses of the various types of iron. The manufacturers of alternating current apparatus were not slow to see the importance of selecting irons which would dissipate the least energy by hysteresis, but the difficulty was in distinguishing that which was good from that which was bad. While pure irons, low in carbon, were invariably better than those which were the reverse, analysis proved entirely inadequate as a guide for selection. The property was due quite as much to the physical character of the iron as to its chemical composition.

The only reliable test was found to be the physical one of measuring the hysteresis losses of a sample. The ballistic method, by which Ewing had made his classic investigations and determined the standard curves, now so well known, was slow and tedious. It could be employed only in properly equipped laboratories by skilled experimenters, and furthermore, as Ewing himself states, judging large lots of iron by single small samples, as was necessary by reason of the expense and tediousness of this method, was very unsatisfactory. Experience has shown that even in one batch of plates of the same rolling so much difference is apt to exist between one plate and another as to make the testing of a single sample furnish a poor guide to the average quality of the batch. Prof. Ewing mentions an instance under his observation in which as much as 15 per cent. variation in samples taken from the four corners of a single plate not quite two feet square was observed in an iron of excellent quality.

But this, up to the present, has been the only method of testing the suitability of iron for transformer and armature purposes, and manufacturers, while they have been giving more and more attention to the importance of procuring the best materials as they realized the necessity for it, have still been subject to variations in material quite as wide as those noted, notwithstanding the exercise of the utmost care in selection.

What was needed and wanted was not a laboratory method but a shop method by which the particular iron that was to go into each individual structure could be tested before it was used. Such a method must be rapid and of at least fair accuracy to be of value, and furthermore required to be one that others than highly trained experts could employ with satisfactory results.

The accomplishment of such a desideratum seemed almost too much to be hoped for, but Prof. Ewing announces in the paper to which we are referring that he has solved the problem in a most complete and satisfactory manner.

By Prof. Ewing's method it seems that any one who can turn a crank and read a clock-dial can make the tests, and the time occupied is so short that it is now possible to know with an accuracy sufficient for all practical purposes the quality of iron that goes into each transformer in the largest manufacturing establishments that are to be found.

The world did not appreciate the value of the results of Prof. Ewing's studies of hysteresis because it had not yet become aware of its baneful effects. It was at that time in blissful ignorance of what it afterwards, most largely through Prof. Ewing's instrumentality, became painfully aware. The world did not demand Prof. Ewing's investigations, but they were undertaken unbidden and the results at first coldly received. The world *has* demanded a more expeditious method of informing itself of the quality of the iron it was given to use, and this new discovery comes as a welcome guest. It will be received with open arms by the electrical fraternity everywhere, and while as a technical accomplishment this latest work of his cannot stand on the same plane as that of which it is the natural sequence, it will be regarded as scarcely less important by the commercial world.

Only second in interest of the literature received by us from England this week, is Mr. Crompton's admirable lecture on "The Utilization of Electrical Energy for Cooking and Heating Purposes," delivered before the Society of Arts, London, on April 24. Mr. Crompton is a pioneer in this line of work, and usually regarded as the highest authority in the world in all matters relating to heating by electrical means. In his address, which we will publish next week, we promise our readers a most instructive dissertation on the new arts of electrical cooking and heating.

* * *

The Load Line.

The most difficult problem confronting central station men to-day is to establish some plan of operations whereby the load line may be as nearly horizontal as possible, showing the continued use of approximately the full capacity of the plant. It is the peak of the load line, generally so conspicuous, which is the bugbear of the thoughtful manager. How to get rid of it is a subject now occupying the minds of practical students everywhere.

In the load diagram of the General Electric Company which we print this week, it will be noticed that this concern, since 1892, has succeeded, if not in obtaining an even line, at least in averting the peak. We do not know that the management has labored with this end in view—the intention may be concealed, but not so the result. The peak at 119⅞ has not been in any danger of being reached again since 1892. Popular opinion is that this company does not aim at an even line, and that the zigzag effect is the one striven for. If that be the case, the speculative directors will regard the product of our draughting room as a thing of beauty. The line shows the splendid chances of the past thirty-six months for making 10 to 30 point turns in the stock, which it is said have been taken advantage of by the insiders.

Appearances now indicate, however, that the wavy up-and-down motion has ceased for good, and that the load-line for the next year will be easily drawn and will be nearly perpendicular—leading down to zero,—after which we have no doubt the central station ideal will be at least partially realized; that is, the line will be horizontal near the zero level.

* * *

A New Fire Board Needed. In the controversy which has arisen in electrical circles over the recent promulgation of the New York Board of Fire Underwriters no criticism is directed against the Attix wire as an excellent and highly efficient product of skillful wire making, which qualities it admittedly possesses. But upon the Board itself must rest all the onus which rightfully, and with certain and poetic justice, belongs and comes to those who do absurd things.

This body has an almost sacred duty to perform. In its official capacity it is supposed to throw about the construction and electrical installations of new buildings such safeguards as shall reduce to a minimum, if not wholly eliminate, all danger and risk from the use of electric service. To accomplish such desirable results the Board must necessarily be in touch with and well informed upon all advances in the art of making electric service safe. But when, through ignorance or in utter defiance of advanced engineering methods, it takes steps which render nugatory all the well-directed and long continued efforts of wire manufacturers, architects, engineers and inventors to produce the highest degree of excellence in all applications of electric service, the Board as a body deserves not only the severest condemnation, but its action makes pertinent the observation that it needs to be succeeded by competent and representative men.

Personal.

Mr. William Taylor, formerly of the firm of Taylor, Dee & Mack, Chicago, has accepted a position in the business office of the *Electrical World* in New York.

James G. Biddle, who has been manager for some five years past of the electrical department of Queen & Co., has recently opened an office at 525 Drexel Building, Philadelphia, as dealer and manufacturers' agent for scientific and electrical apparatus.

Mr. J. S. Speer, secretary of the Partridge Carbon Company, Sandusky, was a welcome New York visitor this week.

Mr. L. E. Myers, of Chicago, was in the city for a few days last week.

Under the Searchlight.

Views and Opinions on Timely Topics.

Love, Hate and "Electricity."

(From a letter to the editor in the New York World.)

Will some kind reader inform me whether love or hate can be solved by ELECTRICITY?

We have no doubt of it. Give us a show.

* * *

G. E. securities sold during the year included:

Cleveland Electric Illuminating Co. (pref.)	$45,000
Edison Illuminating Co., Easton, Pa	27,250
Edison Illuminating Co., New York	500,000
Gesselschaft Co	113,000
Cumberland Electric Light Co., Nashville	40,000
Citizens' General Electric Co., Nashville	45.000
Manhattan Electric Light Co., New York	9,060
Weymouth Electric Light and Power Co	5,000

It will thus be seen that the gilt-edged securities have been sold—leaving what? Clearly non-negotiable stocks and bonds. If anything else COULD HAVE BEEN SOLD to raise necessary money, would New York Illuminating Company's stock have been sold? Certainly not. It is absolutely certain that those securities remaining in the treasury to-day are chiefly worthless and are carried on the books at twice or three times their actual value.

One example is sufficient to show the character of the stuff which has been added to swell the totals this year in these schedules. In the list of manufacturing companies, Schedule A, there appears $2,000,000 of the stock of the Short Electric Railway of Cleveland, a company which has gone out of business owing the G. E. Company $440,000 and stock in which is worth just what the paper would bring by the pound for junk, and nothing more.

Who can be misled by such barefaced humbug?

* * *

ELECTRICITY has no public criticism to make of Mr. Frank R. Colvin as an individual, no private grievance to ventilate. But we wish to warn all independent telephone companies against him as an unfit person to allow in any of their offices. As a supposed independent telephone man himself, he gained access to a great many details of other people's business. In his present position he is compelled to violate all confidences of this nature. He is a spy. He should be kicked out.

* * *

General Electric.

(From Mr. Coffin's Personal Organ.)

The General Electric Company is considering closing the Brush Works at Cleveland, but the question is not yet decided.

A director of the General Electric Company says: "The valuation of the company's assets given in the annual report is only a fair valuation and we ought to still shrink it a little further next year."

Indeed! We guess it will shrink itself before next year.

* * *

The Gilmanesque Idea is Not Dead.

(From a recent Incorporation Notice.)

The Great Western Electric Company has filed articles of incorporation. The offices of the company are at Duluth, Des Moines and Chicago. The capital stock is $500,000, of which $200,000 is preferred. The incorporators are: L. F. Dyrenforth, T. C. Sullivan, Warren A. Drake, H. K. Gilman and R. H. Smith.

* * *

Patents and Prophecies.

(From the Evening Advertiser.)

It will be noticed at once that the "patent" item is unchanged. It seems to us that we have some faint recollection of the able editor of ELECTRICITY telling us about the middle of January that "the $8,000,000 of patent assets would be wiped out this year or next, making a further impairment." In justice to Mr. Greene we will defer remarks on this point until the next annual report comes out, so as to be strictly fair.

Fairness is always the aim of this paper, and we are glad to know the same spirit actuates the esteemed financial editor of our contemporary.

Our prophecy was based upon knowledge, and the 1895 report, like that of 1894, was changed three times in its preparation and a different result reached each time.

An officer of the courts will soon present a report showing his estimate of G. E. assets. Until then we know of no one's opinion half as good as our own.

* * *

WHO MAKES THEM?

To the Editor of ELECTRICITY.

DEAR SIR: We have a customer who wishes to buy an electrical engraving machine. This machine is to be similar to dentists' tools, but will have to revolve instead of working as a hammer. If you know of a manufacturer of such apparatus, will you kindly let me know and greatly oblige. Very respectfully yours, E. M.

[We know of no such machine.—ED.]

* * *

Mr. W. J. Clarke, of the G. E. Railway Department, arrived in New York May 1, having recently left Kingston, Jamaica. Mr. Clarke made the trip from Havana to Montego Bay in company with a number of refugees who had been connected with the rebellion in Cuba.

American Institute of Electrical Engineers.

The annual meeting for the election of officers, reception of reports, and transaction of other business of the Institute will be held at 12 West 31st street, New York City, Tuesday evening, May 21, instead of May 14 as announced on the balloting circulars.

At the same meeting the discussion of Prof. Anthony's paper will be resumed, and it is expected that a paper will also be presented by Mr. A. D. Adams, of Boston, on "The Most Economical Form for Bipolar Field Magnets."

Saturday Half-Holidays in Boston.

The following electrical supply concerns of Boston will close their places of business during the months of May, June, July, August and September at 1 o'clock Saturdays and 5 o'clock other days: Pettingell, Andrews & Company, Holtzer-Cabot Electric Company, Anchor Electric Company, Gillis & Gleeson, Ziegler Electric Company, Thompson-Brown Electric Company, and the Electric Gas Lighting Company.

Electrical Instruction at the American Institute.

At the weekly meeting of the Electrical Section of the American Institute, on Friday evening last, W. H. Freedman, E. E., gave a very instructive talk on "Manufacture and Testing of Cables." The various steps in the progress of manufacture, from the copper ingot to the finished cable, were traced more or less in detail. The methods employed in testing conductivity, insulation resistance, capacity, as well as determining breaking-down point under high voltages, were explained and illustrated by blackboard diagrams.

The Patent Campaign Begins.

The G. E. Company, as already announced in ELECTRICITY, has prepared for a lively patent campaign this summer. One of the earlier suits to be heard is that on the Bursh double carbon lamp against the Western Electric Company, whichis being argued.

The Waddell-Entz Company's Affairs.

Upon application of the receiver, who states that there is no possible return for creditors in running the factory, and little to be divided at best, the court has ordered a sale of the assets to be made within sixty days.

A MAGNETIC TESTER FOR MEASURING HYSTERESIS IN SHEET IRON.*

BY PROF. EWING, F. R. S.

Makers of transformers are now generally alive to the paramount importance, from the point of view of all-day efficiency, of using iron in which the hysteresis losses are small. The need, however, is felt of some simple means by which this quality can be readily determined. Tests made by the ballistic and other methods have shown that different samples of iron may exhibit extraordinarily wide differences in regard to hysteresis. The author has found, for example, in the course of his own tests of iron supplied for transformers, a range of nearly three to one in the hysteresis of good and bad samples. It is unnecessary to point out how much the all-day efficiency of a transformer working under ordinary conditions will be affected if the sheet iron used in its construction has three times as much hysteresis as it need have. Again, experience shows that even in one batch of plates of the same rolling so much difference is apt to exist between one plate and another as to make the testing of a single sample furnish a poor guide to the average quality of the batch. Even in a single plate samples cut from different parts show marked differences in hysteresis. The author has noticed as much as 15 per cent. variation in samples taken from the four corners of a plate not quite two feet square, the material of which was of very excellent quality. It is well known that different analyses of the nearly pure iron of which such plates are rolled exhibit corresponding variations. The impurities appear to be unequally distributed; and, further, it is not unlikely that the irregularities which are found in the magnetic quality depend in part on slight differences in the treatment as regards annealing. Whatever their cause, there can be no doubt that they exist, and their existence makes the result of a single test often somewhat fallacious. What is wanted is a sufficiently large number of tests in any one batch of iron to allow a fair average to be estimated for the quality of the batch.

To make this possible a simple and expeditious method of testing is imperative. The ballistic method, although unimpeachable on the score of accuracy, is anything but expeditious, and can scarcely be called simple. The value of the hysteresis is arrived at by first observing the relation of the induction B to the magnetizing force H for a considerable number of points in each of a series of cyclic processes of magnetization, then drawing the B-H curve for each of these cycles and measuring the enclosed area. The operation requires some skill and experience, and a good deal of patience. The same criticism applies to other methods of finding the hysteresis by first finding the relation of magnetism to magnetizing force (as, for instance, by the permeameter or by the author's magnetic curve tracer). It must be borne in mind that in the testing of transformer iron the permeability is a quite secondary matter. What is of primary importance is the hysteresis, and high permeability is not necessarily or invariably found associated with small hysteresis. In the testing of sheet iron by the ballistic method the finding of the relation of B to H is a step in the process; it is not the object of the test.

These considerations have led the author to devise an apparatus which measures the hysteresis directly by a single operation, and in a manner sufficiently simple to allow the test to be applied to numerous specimens without much expenditure of time, trouble or iron. The basis of the instrument is the mechanical measurement of the work done in causing reversals of magnetism to take place in the iron under examination. Such measurements have been made before as a laboratory experiment and under special conditions. Thus, Mr. L. R. Wilberforce and the author, two or three years ago, endeavored to determine the hysteresis of a cylinder of iron when rotated in a strong magnetic field, by measuring the couple required to keep it slowly turning. And a method of the same general character has been employed with complete success by Mr. F. G. Baily to investigate the disappearance of hysteresis which takes place in such a cylinder when the field is made sufficiently strong—a matter of great interest in connection with the molecular theory of magnetism. In the machine now brought forward as a practical tester for workshop use the same mechanical principle is involved. The process of reversal, however, resembles that which occurs in a transformer rather than in a dynamo; the induction is caused to have practically the same value in all samples, and that a value appropriate from the transformer point of view; the sample is cut in a very simple form, and is arranged to be readily inserted and removed. The magnetism is reversed by turning a handle, and the result is given by the position of a pointer on a scale.

Fig. 1 is a drawing of the instrument now exhibited, the form of which has been reached after a good deal of experiment. The iron to be tested is cut or stamped in the form of strips, which are three inches long and five-eighths of an inch wide in this instance. The number of these pieces that is taken to compose the sample depends on the thickness of the sheet: six or seven pieces will in general be sufficient for the usual gauges of transformer iron, and a smaller number if the material tested is the thicker sheet used in dynamo armatures. The bundle of pieces forming the sample is placed in a carrier, *a*, and is covered with a vulcanite washer and secured by two clamps, *b b*. The carrier is made to rotate by means of the friction pulley, *c*, and driving wheel, *d*. This causes the sample to revolve between the poles of the permanent magnet, *e*, with the effect that its magnetism is periodically reversed. The work done in reversing the magnetism, in consequence of hysteresis, causes a mechanical movement to be exerted by the revolving sample upon the magnet, and the magnet being supported on a knife-edge at *f* in line with the axis of the carrier, tends to follow the sample and is deflected through an angle which serves to measure the work expended. Since a definite amount of work is done per reversal, whatever the frequency (so long as that is not so high as to make a sensible addition to the work by inducing currents), the deflection of the field-magnet is independent of the speed at which the carrier revolves, and no special care has to be taken to turn the handle at a uniform rate. If the rate is very slow the magnet will show each individual impulse which it receives as the ends of the sample pass its poles, but when the speed is sufficiently raised these impulses blend into a steady deflection; and the speed may be further augmented, to the extent of doubling it, or more, without making the deflection change. It is only at higher speeds still that the effects of induced currents become apparent. The deflection is observed by means of a pointer and scale above the magnet. The swinging of the magnet is checked by means of a dash-pot below, consisting of a vane, or spade, moving in a box filled with oil. The stability is adjusted to give any required degree of sensitiveness, by means of the weight, *g*, which travels as a nut upon a screw fixed to the magnet, and serves to raise or lower the center of gravity of the oscillating system. The magnet swings about a knife-edge working in an agate trough, and a lifting arrangement like that of a balance is provided, operated by the handle, *h*, to save the knife-edge from unnecessary wear or injury. The pointer is set to zero in the middle of the scale by means of a nut which runs on a screw projecting sideways from the middle of the magnet, and a more delicate adjustment of the zero may be affected by means of the levelling screw, *i*. In operating, the observer inserts the sample and secures it by the clamps, then begins to turn the handle and lets the magnet down on its knife-edge. After reading the deflection of the pointer to one side he reverses the direction of rotation, reads the deflection to the other side, and takes the sum of the two readings as the total deflection. The deflection is proportional, or very approximately proportional, to the hysteresis of the iron, even when samples widely different in quality are compared.

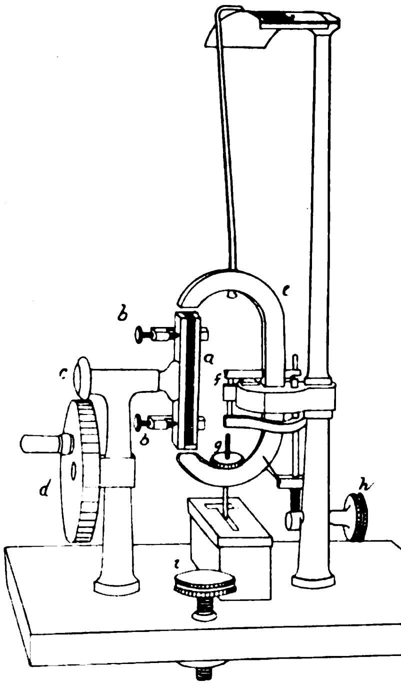

FIG. 1.

To secure that this shall be so, a considerable air space is left between the magnet poles and the ends of the sample, with the result that such variations of permeability as are liable to be met with in different samples are almost without influence upon the total induction through the iron. The author has examined the induction by means of a search coil wound around the sample, and has found it to be practically the same in the best and worst specimens of transformer iron. The dimensions and strength of the field-magnet are so proportioned with reference to the section of the sample and to the extent of the air gaps as to make the induction have a value fairly representative of transformer work. In the instrument shown the induction is about 4,000 C. G. S. units with the normal size of test sample. By increasing or reducing the area of section of the sample the intensity of the induction is reduced or increased. Within reasonable limits, however, any value of this intensity may be adopted in testing, for it is known from the results of ordinary ballistic tests that curves drawn to show the relation of the hysteresis loss to B preserve their relative positions through a wide range of values of B. In other words, the relative amounts of hysteresis in different samples do not change, or scarcely change, when the iron is more strongly or less strongly magnetized. This, of course, follows from the fact that a formula of the type originally suggested by Mr. Steinmetz,

$$\text{Hysteresis loss} = c\,B^n,$$

is practically applicable, c and n being constants within limits which are more than sufficiently wide to include the inductions used in transformers.

In cutting the pieces which are to make up the sample care has to be taken to make the length always the same, otherwise the air gaps, and consequently the induction, will vary irregularly. The carrier is formed so that it serves on a length gauge; and to facilitate the preparation of the samples a supplementary gauge is furnished in the form of a clamp of hardened steel, in which the strips are readily filed to the exact length after being cut a trifle too long. The width of the pieces requires no particular care.

---

*Paper read at the Institution of Electrical Engineers, London, April 25, 1895.

The author was under the expectation that it would be necessary in making an accurate comparison of quality between different specimens to give the sample the same weight in each case, in order to make it have the same cross section. He finds, however, that no nice adjustment of the weight is required, provided advantage is taken of a property which will be most easily explained by citing an experiment made with the tester.

The experiment in question shows the effect of varying the section of the iron by varying the number of strips which make up the sample. Eleven strips of thin transformer iron were taken, each three inches long by five-eighths of an inch wide, cut from the same plate. These were all used to form the sample in the first instance; then one was removed and the remaining ten were tested, then nine, and so on, until finally the sample under test consisted of a single strip. The following are the scale readings for this, and also for another exactly similar experiment, which was made with a different specimen of transformer iron, of a poorer quality than the first. The two specimens are distinguished as A and B:

Number of Strips in Sample.	Scale Readings of Magnetic Tester.	
	(Specimen A.)	(Specimen B)
11	72	118
10	71	117½
9	70	117
8	69½	116½
7	69	116½
6	69	117
5	69	120
4	71	124
3	75	132
2	85	142
1	69	130

These results are also shown in the curves of Fig. 2. It will be seen that both curves have the same general character, and that the scale readings of the tester pass a very flat minimum when about seven pieces form the sample. Whether six, seven or eight pieces be used, there is no material difference in the readings. Precisely similar results are given by other specimens. Hence, if a weight is chosen equal to that of seven pieces of this material as a general standard, it will suffice, in preparing other samples for test, to select that number of strips which will give a weight approximating even roughly to the standard weight. The nearest whole number of strips will do, and it is not necessary to cut a narrow or wide strip to make up the exact weight.

When only two or three strips of this thin iron are taken, the work expended in reversing the magnetism of the bundle is increased. The total induction through the sample is somewhat diminished, but the intensity is increased, and this more than compensates for the smaller volume of iron that is being operated on. It is only when the sample is reduced to a single piece that the saturation of the iron prevents B from increasing sufficiently to continue this effect, and there is then a sharp fall in the curve.

These considerations have led to the use of samples the aggregate thickness of which is equal to that of six or seven thin transformer plates. In testing armature plates the same weight is approximated to by taking a smaller number of pieces. It is scarcely necessary to add that solid pieces, or bundles of wire, may be tested as well as sheet iron.

CALIBRATION.

An extensive series of experiments has been made in order to determine to what degree of accuracy the readings of this magnetic tester correspond to the hysteresis losses as found by ballistic tests for various samples of iron. For this purpose it was necessary to test each identical sample in as nearly as might be the same state, first ballistically and then in the new tester. In view of the variations which are observed between one part of a plate and another, the author did not feel that it would be satisfactory to use separate pieces for the ballistic observations and for the observations to be made with the tester. After some consideration he adopted the following two plans:

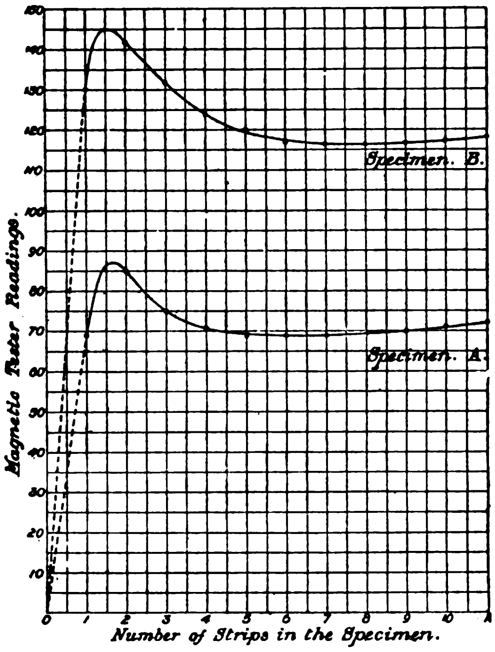

FIG. 2.

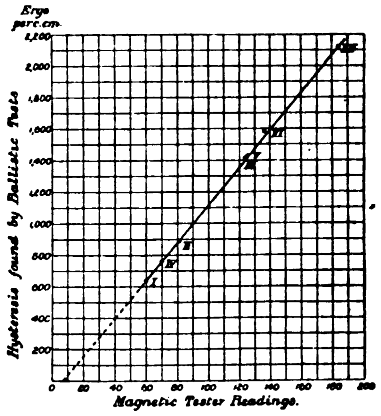
In the first place, the ballistic tests were made on rings, each consisting of a long strip cut to the width subsequently wanted in the magnetic tester, namely, five-eighths of an inch. This was bent into a ring, the ends just overlapping. After bending, the ring was annealed in a gas flame to get rid of the hardness produced by the bending. This is a most essential step, for in good iron the process of coiling into a ring, even of large diameter, hardens the metal very perceptibly and increases the hysteresis. Then the ring was tested ballistically, a sufficient number of cycles being taken to allow a curve to be drawn showing the relation of the hysteresis loss, or $\int H\,dI$, to B, from $B = 2,000$ to $B = 8,000$ or so. The same thing was done with each ring. Then the rings were uncoiled and cut up into three-inch lengths for the tester, and the pieces were straightened and annealed to get rid of the hardness due to this straining. The whole number of pieces into which each ring had been cut were then dealt out into packs of six (or five, or seven, according to the thickness of the material), and these packs were shuffled until repeated trials in the tester showed that every pack gave nearly the same scale reading. The mean scale reading for the several packs obtained from each ring was then taken as a mean applicable to that ring. Here it was assumed that the first and second annealings might be held to bring the material into the same physical state.

To guard against any uncertainty on this point, four additional trials were made, using a different procedure. Long strips were again cut, but each of them was tested ballistically in its original straight form in a solenoid with open ends, the induction coil being wound over the central region only. Each strip was 36 inches long and five-eighths of an inch wide, and a single strip was used in each test. The general effect of the free ends is to shear over the B-H diagram, but not to alter the enclosed area. Enough areas were measured to determine, as before, the curve of $\int H\,dI$ and B for each strip. The strips were then cut up into pieces for the tester which were treated as in the former case. In this procedure there was no annealing.

By these two means seven standard samples in all were produced, of quality ranging from exceptionally good to exceptionally bad. The magnetic tester readings for these were taken, using approximately equal weights to form the sample in each case. In the following table the tester readings are given alongside of the value of the hysteresis loss ($\int H\,dI$) as determined ballistically for an induction, B, of 4,000 units for each of the seven specimens. Numbers I, II and III were those tested ballistically in the ring form, the others were tested in the form of straight strips.

Comparison of Magnetic Tester Readings with the Hysteresis Loss determined by Ballistic Tests.

No. of Specimen.	Magnetic Tester Scale Readings.	Hysteresis Loss by Ballistic Tests. Ergs per c.cm.
I.	60	640
II.	81	890
III.	124½	1,420
IV.	70	750
V	125½	1,430
VI.	136	1,580
VII.	184	2,120



The same results are shown graphically in Fig. 3. It will be seen that they accord well with one another, and that the scale reading of the magnetic tester is nearly proportional to the hysteresis loss. A straight line drawn from the origin among the observed points lies sufficiently near all of them to allow the assumption to be made, so far as workshop testing is concerned, that the deflection in the tester, when multiplied by a factor depending on the sensitiveness of the instrument, is a practical measure of the hysteresis.

More exactly, however, the locus of the points is seen to be a straight line passing not quite through the origin. This may be partly due to the fact that the induction produced in the tester is not absolutely so high in the bad as in the good iron. In all probability, however, it is mainly due to this—that as the sample revolves some small amount of work is done in periodically changing the distribution of magnetism in the field-magnet itself, in addition to the work that is done in reversing the magnetism of the sample. Any work expended within the field magnet would contribute to the deflection, and would exist even if the sample (while retaining its permeability) were entirely destitute of hysteresis. Hence the line may be expected to pass a little to the right of the origin, as it is actually found to do.

It is intended to furnish with each instrument two standard samples of iron, along with a table stating their hysteresis as found by reference to ballistic experiments (in ergs per cubic centimeter, and also in watts per lb., at an assigned frequency). In proceeding to test other samples the operator will first note the deflection given by each of his standard pieces, and then, by simple proportion, or by aid of a diagram, he may go on to interpret in absolute measure the deflection observed with any specimen. This will make his results independent of any loss of strength on the part of the field-magnet, or of any changes he may find it convenient to make in the sensibility of the instrument.

The hysteresis of the standard samples is stated for B = 4,000. To find the hysteresis for any other induction it is only necessary to use the following table of factors, which has been deduced by the author as a general mean from ballistic tests of many samples:

Induction B.	Relative Amount of Hysteresis.
2,000	0·33
2.500	0·47
3,000	0·63
4,000	1·00
5,000	1·41
6,000	1·89
7,000	2·41
8,000	3·00

Other forms of the instrument can be constructed by making the field revolve while the sample is pivoted, so that the sample deflects; by placing the axis vertical instead of horizontal, with a control furnished by a spring or by bifilar suspension; by using a weighted arm or a torsion head to measure the deflecting couple, instead of observing the deflection by a pointer on a scale; and so forth. But the author believes that the form now exhibited will be found both accurate and handy in general use.

He hopes it may contribute indirectly to the betterment of the iron used for magnetic purposes, by making it easy for a purchaser of iron or a purchaser of transformers to specify a maximum of hysteresis, and to see that he gets what he specifies. A notable improvement in the quality of sheet iron in this respect has been going on during the last few years, and it is now practicable to get iron which a short time ago would have been pronounced impossibly good. But it would be easy to quote tests showing that some iron of relatively very poor quality still finds its way into armature and transformer cores. The author's aim has been to put into the hands of those who are practically concerned with magnetic hysteresis, whether as makers of plates, builders of transformers, or engineers of alternate-current supply stations, an apparatus in which testing is reduced to its simplest terms, where each test consumes no more than a few square inches of the sheet, where the preparation and testing of the sample take only a few minutes of time, and the operation consists in turning a handle and reading how good or bad the iron is from the position of a pointer on a scale.

Westinghouse News.

The daily papers report that the Westinghouse Electric Company is now working day and night forces at its new factory at Brinton, and has on full time 2,700 factory hands. The output in the railway department is twenty-five motors per day and will soon be increased to thirty.

The board of directors have expressed the opinion that it would be desirable to adjourn the stockholders' meeting until the latter part of June or early in July, in order that a more adequate showing of the importance and advantage of the new works may be then given to the stockholders.

UNDERWRITERS' RULES.*

BY WILLIAM A. ANTHONY.

(Discussion.)

Mr. C. O. Mailloux—This paper, with its unimposing title and modest dimensions, is, I think, one of the greatest importance to electrical engineers. I do not wish to disparage the preceding paper, and it ought not to be any disparagement to say that the paper we have just heard is at least of equal merit, great as is the value of the preceding paper, because although the question of electric wiring is one which seems a relatively simple matter in these days of sines and sinusoidal functions, yet it is one which, when we come to the practical and commercial side of our profession, we have at one time or another to deal with; and there are those of us who have extensively to do with it. I think that we should be very watchful of the construction which is placed upon the rules formulated by the different insurance companies. They may be working for the purpose of making the electrical business better, but that is with them only an incidental consideration; they have not the interest in so doing that we should have. Their interest is primarily to see to it that the installation is made safe from fire. We have a further interest. We have some interest in seeing that the installation is perfect, not only electrically but practically, and that it is a credit to the profession which it represents. I am very sorry to call the attention of this body (or at least some of the members of it who may not be familiar with it) to the fact, though many of you are familiar with it, that in the matter of insurance rules the electrical fraternity has been handled with a spirit of inconsistency and partiality, and with a want of that broad, liberal treatment that characterizes other lines of fire inspection. This case of the Attix wire is perhaps as good an instance as any, and it ought to be one sufficient in importance to call the attention of electrical engineers to the necessity of our acting, either singly or jointly, in such a manner and with such emphasis as to let our voice be heard and prevent the continuance of such inconsistencies.

As the paper very clearly puts it, it strikes one as almost absurd to characterize or define as a tube a piece of wire which has a solid wrapping of some material supposedly fire-proof applied to it. It is no more a tube than would be any other wire on which might be put a covering braid or some other material than the insulation. I do not see why a simple braid or a simple tape really is not as much a tube; yet we have found ourselves tied hand and foot in many cases by such rulings as that on the part of insurance inspection authorities. I might mention a dozen cases in my own practice which are equally incongruous, equally absurd, and which have caused needless delay, needless expense, trouble and annoyance. I think it is time that the Institute as a body should protest against a continuance of such rules and such measures on the part of insurance companies. I may state with pleasure that I have heard several representatives of distinguished and prominent insurance companies express themselves in no uncertain terms in regard to the manner in which this work has been done by those who were supposed to represent them and do their best for their business. I have stated to some of them that it has an evil influence on their business. I know of cases where the insured has preferred to do his own insuring rather than submit to the arbitrary dictation of the insurance inspectors. Some of the insurance companies themselves have expressed their dissatisfaction, and they feel, in some quarters at least, that there ought to be a change in policy, that insurance rules ought to be compatible with and favorable to progress in electrical installations and ought to be the means of promoting progress rather than obstructing it.

Mr. William J. Hammer—I am heartily in sympathy with the gentleman who presented this paper and the gentleman who has just spoken. I think that subjects of this character are of the utmost importance to the American Institute of Electrical Engineers. At the last annual meeting I had the honor as the chairman of the National Electric Light Association's Committee on Standard Rules for Electrical Construction and Operation to present their last report to the Institute, with the result that a committee be appointed to examine and endorse it on behalf of the Institute in order to secure fuller co-operation and a better enforcement of these rules. Two gentlemen appointed on the committee of the Institute, who are among the most honored members of this body, made the statement to me at the time, that they thought it was unadvisable for the Institute to take up a matter of this kind, because it was purely a commercial one and the Institute was a scientific body. In this connection, I wish to say that I heard some one make the remark recently that many members in the Institute thought it was hard to get papers before this body which were within five miles of the earth. I think we have had admirable papers of the character that have been read to-night by our worthy President and Mr. Kennelly, but there are also other papers, reaching a very large percentage of the members, that are of vital interest to the professional work that a good many of us are engaged in, and I am particularly interested in this class of work, having been identified for a number of years with the work of the Committee of the National Electric Light Association, which promulgated the rules now practically used all over this country by the insurance people generally, and I might add, without any credit to the organization that brought them out. I think severe criticism can be made justly upon the Underwriters for allowing their inspectors or their experts to bring out rules of this character and pass them and foist them upon electrical engineers and the public at large. I think many of these things have not been treated in as conservative a manner as they might have been. Last year a very earnest effort was made to secure the co-operation of all the electrical interests, including the insurance inspectors, etc., with a view to having one single set of rules go out, having them more rigidly enforced and having them kept up to date. Those efforts, although very earnest were not brought to a conclusion. Since that time the committee has continued its efforts, and before very long the Committee of the National Electric Light Association, who are recognized as the ones who have brought this subject to the front for years past, will extend a formal invitation to the representatives of the telephone interests, the street railway interests, the Fire Chiefs' Association, the American Institute of Electrical Engineers, and perhaps some other association or two which will be interested in seeing that proper rules, which are conservative in their character and which do not benefit any particular class of manufacturers or any particular industries to the exclusion of others, are adopted; and it is hoped that before this year is out some uniform action will be taken by these organizations which will look to just the step that Prof. Anthony and others have recommended and which is certainly highly advisable. I merely refer to this now, because very earnest efforts have been made during the past year, and they are being pushed very actively by a committee of the National Electric Light Association acting in conjunction with some of these other gentlemen, and the matter will be brought before the Institute as well as these other bodies within a short time and in a manner which I trust will appeal to them and be treated as being of such decided importance to the electrical interests for the Institute of Electrical Engineers as well as other bodies to co-operate with the National Electric Light Association in its important work.

Mr. H. Ward Leonard—This subject is one that has interested me for a good many years, and I am familiar with the difficulties that have always been met with by contractors in dealing with the rules set forth by the Underwriters and the requirements that they lay down. Having installed a good many hundred thousand lamps on different styles of wiring in the past ten or twelve years, I feel that the use of anything such as has been described in this paper as the Attix "tube and wire" is certainly a distinct reversion to the condition that applied to electric light wiring in about 1885 or 1886. I personally installed work at that time which was done with practically identical materials and which were as good, I think, as the Attix tube and wire can be to-day, and it seems to me that the conduit is an essential condition for thoroughly first-class work to-day and that a conduit to be of any service whatever must be a permanent, reliable, strong hole, which will be always there, enabling you to pull the wire out and in in case of any failure of the wire. I personally am very strongly a believer, and always have been—at least for a great many years—in placing the opposite poles of a circuit, whether it be a two-wire circuit or a three-wire circuit, all inside of a single iron pipe, and I have put in some thousands of lamps in this city in which both poles of the circuit are inside the single plain iron pipe with quite satisfactory results, and I wish to call attention to a point which may not have impressed itself on all the members, and that is that in case you do have both poles of the circuit inside of the iron pipe and the system of iron pipe be grounded, it is almost inconceivable that any condition of leakage or trouble in the electric circuit should occasion a fire. In other words, it is my belief that the rule of the Underwriters which they have so strenuously urged for the last few years, that when conduits are used only one wire be placed in each conduit, is merely aggravating the possibilities of fires which could be eliminated by using first-class insulated wires inside of a single metallic conduit. The Underwriters apparently have been convinced of this point comparatively recently, and have waived that requirement where the wires are placed in an armored conduit. As an indication of the difficulty of securing attention on the part of the Underwriters to those whose voices ought to be heard in practical matters relating to electric work, I will say that there exists in this city an association of nearly all of the representative concerns of electrical contractors; and feeling that the Underwriters had imposed very arduous and unreasonable rules, and in fact conditions which made it more expensive, more difficult and more dangerous to do electric wiring work, the contractors in question appointed a committee when they learned that the Underwriters were likely to issue a new set of rules in the then immediate future. They appointed this committee to wait upon the Underwriters for the purpose of aiding them in drawing the rules and in arriving at rules which would be mutually satisfactory, and I happened to be chairman of that committee and so can speak about it from my own knowledge. A letter was sent to the Underwriters by me, as chairman of this committee, expressing a desire to participate in their discussions in regard to this matter, or at least to be given an audience to express our views in regard to some of the points which we hoped would not be inserted in the new rules, and which we had considered arduous in the old rules, and the letter was acknowledged with the statement that in case they cared to have any conference with us or to hear any expression of opinion from us they would let us hear from them, which we never did. I am heartily in sympathy with the general tenor and purpose of this paper, and believe that this Institute is by all means a proper body to express its opinion in regard to matters having so practical a bearing on the work of electrical engineers.

---

* A paper presented at the 96th Meeting of the American Institute of Electrical Engineers, New York and Chicago, April 17, 1895.

Mr. James Hamblet—It came to my notice a short time ago that certain buildings in the city of Brooklyn were wired for electric lights and inspected by the inspectors of the Board of Fire Underwriters and approved. The lights were used for a time, and then a certain time after that inspection they were again inspected and condemned, and the owners were compelled to re-wire their buildings or improve them according to the new rules adopted by the same Board of Fire Underwriters. I also know a similar instance in Brooklyn where a contractor made an estimate for the work and the inspectors were watching him; and the inspector told him that by the new rules a certain kind of tube was to be used and he must put in that kind of a tube. That destroyed his profits on that little job.

Mr. Mailloux—I do not think that this subject can be disposed of in the time that remains for this discussion, and for one I feel that I would like to have an opportunity to collect my ideas. I am under the weather this evening with a cold, and can scarcely formulate my ideas as I would like to. There are one or two facts in connection with the matter which I think it might be well to bring to the attention of the meeting, and which may serve to stimulate discussion. In the first place I would like to call attention to the fact that the insurance companies themselves are not entirely satisfied with the way the matter has been arranged, and at present out of some forty or fifty insurance companies represented in New York City there are nearly one-half who have formed a little insurance inspection association of their own. They are no longer satisfied with the inspection made by the official Underwriters but have an inspector of their own. I am very sorry that their inspector is not here this evening, as he is a member of the Institute and could give us some very interesting information. I trust that he may have an opportunity at another meeting to give us his experience, which is, I assure you, quite interesting.

Gentlemen, I feel quite strongly in this matter, because I have had a great deal of experience with the insurance inspectors not only in this but in various districts, and as Mr. Jenks has very well observed, I found a noticeable difference, of which I will give you one instance. The iron conduit tube was adopted by the New England Insurance Exchange in June last. I had occasion to communicate with them with reference to a large installation at Newport which was in their district. I had found that their rules would not allow me to use an iron conduit, although there were certain electrical and other objections to any other forms of conduit which might be allowed under the rules. I stated the case, urging the electrical objections, and the mechanical ones as well, and received a reply the next day stating that the objections were well taken, that they had been submitted shortly before by others, and that it had been decided to allow the iron conduit tube to be used with twin conductors for such cases. Some four or five months afterwards I had occasion, in connection with several installations contemplated in New York City, to go over the same matter. A question came up almost similarly. I went over in person to consult with the officials of the inspection department in New York and was informed by them that they had as yet taken no action in regard to the iron conduit tube, expressing at the same time grave doubts as to the propriety of their taking any action whatever. It seemed to them to be something that was of very doubtful, if any, utility, if not absolutely bad. However, in the same breath almost, I learned that the Attix tube, so-called, was then allowed. This was several months before any official promulgation of this "Attix" rule was made, as this conference took place some time in October or November. You can scarcely imagine the feeling with which I heard this announcement. I scarcely could believe that we were in a metropolis and in a progressive age when I heard that we were going to be relegated by official direction back to methods which I for one should not sanction. I will state that as a member of the examining board of this Institute I would not want to acknowledge or accept as a member a man who was capable of admitting Attix wire as the rule prescribes. I would consider that he was doing something derogatory to his profession. Although we are still far away from the ideal and the perfect, we who have had practical experience with the different ways of interior wiring consider the iron conduit tube such a great step in advance that we hailed it with a certain degree of delight; but we were literally told that we must not touch that. Now I submit when we reach such a point that the progress of our profession is retarded by arbitrary methods such as these it is time for us to act. I will give you another case which is quite interesting. I have now a case where the insurance inspectors inspected a large dry goods establishment in Brooklyn. I was called in by the proprietors of the establishment after they had made efforts during several months to adjust the matter with the insurance companies—I was called in by them to see what could be done in the matter. It took me three months to bring about a conference between the various insurance inspectors interested in it. There were some twenty odd companies who carried partial risks on the establishment, it being a very large one. I discovered very quickly that some of these inspectors wanted certain things done and other inspectors wanted that very thing not done, and so on, for a long list of requirements; yet they were all working from the same rules. Some of them told me that I must not allow any molding to be capped. Others said that that was very wrong, the rules required it to be capped; and so on through a long list of inconsistencies. I began in June. In October I succeeded in bringing about a conference between the different insurance companies at which I appeared as representative of my clients. I took delight in calling the attention of the seven or eight inspectors present to the fact that they were extremely inconsistent and arbitrary. I put it in those words and stated my reasons clearly, and this particular case furnished me ample reasons. I think it had a salutary effect—a certain agreement was drawn which stated what these inspectors would all agree to agree or disagree about. I had made so many efforts to satisfy them all that I had given up hope of doing so, and I thought all further effort useless until I had their signatures as evidence of what they would or would not allow. It was no longer a question of rules. It was a question of what their individual preferences or whims might dictate. Now, gentlemen, I think the electrical profession needs some attention when it is placed in such a position as that. I think that, not only looking at it from a scientific standpoint, but also from the standpoint of dollars and cents, it will pay us to go to the bottom of this thing. I believe that with the proper amount of suasion we ought to be able to place ourselves in a position where, instead of being dictated to, we may ourselves dictate to some extent what is proper. I do not think there is a more competent body in the United States to formulate rules and restrictions, to prescribe what is a proper thing to do in connection with electric wiring, or what is profitable and desirable from the engineering standpoint. I submit that men who are business men merely, though they may have experience, are not so well fitted as those who have had the training and experience of years to do this. I think that with all the scientific men and all the practical men that this Institute contains it is more competent than any other body to dispose of this question. I am in a position to assure this body that it has sympathy from the outside, that it has sympathy from the very ranks of the insurance companies—which is saying a great deal—because I have already called to your attention the fact that they have dissenters, men who are dissatisfied with the way their business is transacted, and they are only waiting for a word of sympathy or encouragement or some little energy on our part and on the part of all the other associations interested in the electrical industries in order to give us a helping hand and bring about the desired change.

(To be continued.)

New York Wins.

Next N. E. L. A Convention to be Held in This City.

At a meeting of the Executive Committee and officers of the National Electric Light Association held in Grand Central Palace, New York, Saturday evening last, it was officially decided to hold the next Annual Convention in New York. The motion naming New York as the place of meeting was offered by Mr. John A. Seeley and seconded by Mr. Chas. R. Huntley. It was passed by a unanimous vote. The question of the advisability of holding a Convention independent of an exhibit by the manufacturing and supply interests was raised by Mr. A. J. De Camp, of Philadelphia, and discussed at some length by that gentleman and others. On motion of First Vice-President Nichols, a committee, consisting of Mr. Seeley, Mr. Huntley, Mr. De Camp, and the president and vice-presidents and secretary, was appointed to meet at some future time to fully consider the question in all its relations.

Vice-President Nichols, appreciating the valuable services the electrical press has rendered in behalf of the Association and its work, moved that a vote of thanks be tendered to the workers in this branch. The motion was warmly seconded by Mr. Gardener.

Introductory, if not preparatory, to the business of the evening, a dinner with elaborate menu was served. The following gentlemen were present: C. H. Wilmerding, president, Chicago; Frederick Nichols, first vice president, Toronto, Can.; E. F. Peck, second vice-president, Brooklyn; George F. Porter, secretary; E. H. Davis, Williamsport, Pa.; W. R. Gardener, Pittsfield, Mass.; J. J. Burleigh, Camden, N. J.; A. J. De Camp, Philadelphia; C. R. Huntley, Buffalo; W. W. Carnes, John A. Seeley, A. Markle, R. B. Corey, M. Nathan, W. D. Weaver, S. L. Coles, T. C. Martin, W. F. Osborne and B. E. Greene.

The Metropolitan Trust Company of New York has applied to the Federal Court at Sioux Falls, S.D., for the appointment of a receiver for the South Dakota Transit and Railway Co. The trust company holds bonds of the road amounting to $75,000. It was considered certain that Judge Edgerton would appoint Dr. F. H. File receiver.

GENERAL ELECTRIC'S THIRD ANNUAL REPORT.

Results Claimed by the Company for the Past Year's Operations.

COMPARISONS WITH PREVIOUS YEARS.

Following is the full text of the General Electric Company's report for the year ended Jan. 31, 1895:

SCHENECTADY, N. Y., May 1, 1895.

To the Stockholders of the General Electric Company:

For the sake of greater clearness, the following report has been divided into two sections, showing:

1st. The result of liquidating the assets which appeared on the company's books prior to January 31, 1894.

2d. The result of the business of the fiscal year ending January 31, 1895.

As previously reported, the profit and loss statement showed on January 31, 1894, a debit balance of	$12,454,967.42
The result of liquidating and providing for loss on the old assets, as explained below, has increased this by	2,754,392.27
Making the total loss on old accounts (prior to 1894) as now ascertained or estimated.	$15,209,359.69
The business of the year 1894 has yielded a net profit (over interest on debentures) of	414,642.72
Leaving the present debit balance of profit and loss	$14,794,716.97

LIQUIDATION OF OLD BUSINESS.

In the last annual report your directors sought to exhibit the extent to which your company had suffered from the panic of 1893, and from other causes inherent in some of the enterprises in which it became interested at the time of its organization. Mention was made of the fact that the accounts receivable included $2,531,609.88 due by the Fort Wayne and Northwest companies and other allied interests. Contrary to the expectation of your directors, and the statements of persons directly interested in the Northwest Company, your claim as a creditor of that company now proves to be without value; and certain other interests inherited by your company through the Northwest Company are also valueless. The aggregate loss from these sources is about $945,000 (viz., $456,484.48 on the account owned, and about $489,000 on other items), and this sum is included in the charges to profit and loss in the Supplementary Statement for the year 1893 attached hereto.

During the past year the Fort Wayne Electric Company, a former ally of one of your constituent companies, has gone into the hands of receivers, and its affairs are now being liquidated by the court. Your company has filed with the receivers its claim for $1,137,555.48.

The balance sheet and the schedules accompanying it show the outstanding interests of your company as stockholder in manufacturing and other companies. Many of these securities will be sold as opportunity offers. Such a course will, in some instances, involve considerable shrinkage from former book values.

There exist also several unsettled contracts antedating the formation of your company, but which your company has to recognize, and which will cost, perhaps, $500,000 to settle.

To cover the estimated loss on all the matters above mentioned, your directors have arbitrarily charged $2,000,000 to profit and loss account, and the results, as shown at the head of this report, are after making this deduction.

BUSINESS OF THE FISCAL YEAR ENDING JAN. 31, 1895.

Notwithstanding the adverse conditions of the past year, the output of your various factories at cost value was only slightly below that of the previous year. The output in the amount of material produced was considerably in excess of the previous year.

Special attention has been given to the supervision of credits, economy of administration and the improvement of factory facilities, and your directors and officers have sought to adopt every device calculated to increase the efficiency of manufacture and to reduce the cost of the manufactured product. In this they have been in a marked degree successful, and great credit is due those officers and employees of your company directly in charge of manufacturing details.

In the last annual report mention was made of the shrinkage in inventory values of electrical machinery arising from new inventions and improvements, whereby types of machinery which have been the best of their kind are often rendered obsolete. It is impossible to guard wholly against loss from this source, inasmuch as it is essential for your company to keep on hand at all times a considerable stock of manufactured goods. Such stock has been greatly reduced in the past year, and it will be the policy of your board to keep it down to the lowest point consistent with prompt filling of orders. This, together with the work accomplished in developing standard types of apparatus and supplies, warrants belief that the loss from this source will be diminished in the future.

In the last report your directors expressed the opinion that they could, out of the then unliquidated assets, pay off the balance of your floating debt and also provide all necessary working capital. These expectations have been realized, and in addition thereto the company has purchased and cancelled $1,250,000 of its own debentures at an average cost of less than 89 per cent.

As will be seen by the statement of profit and loss herewith, the business of the year just closed amounted to		$13,263,611.58
The cost of goods sold, legal and general expenses and taxes were		11,451,863,98
Leaving a gross profit of		1,811.747.60
Against which is charged interest on debentures outstanding		464,583.83
Leaving (over interest on debentures)		$1,347,164.27
There are further charged off:		
Various old losses which are difficult of division between 1894 and earlier years, and are, therefore, all charged against the year ending Jan. 31, 1895	$443,023 96	
Cost of all patents and franchises acquired or settled for during the year	162,298.11	
Depreciation of inventories	288,401.14	
Sundry losses	38,798.34	
		932,521.55
Leaving a net profit of		$414,642.72

EXPIRATION OF THE INCANDESCENT LAMP PATENT.

As a result of the decision in the "Bate case," recently announced by the Supreme Court of the United States, it is now settled that the fundamental patent upon the Edison incandescent lamp expired in November, 1894. Your company still owns patents of more or less importance upon the incandescent lamp, but it will chiefly rely upon the high quality of the lamp manufactured by it and its facilities for manufacturing in large quantities at a low cost to maintain its commanding position in the lamp business irrespective of patent control. Lamp prices have necessarily been greatly reduced. While the volume of this important part of your business will without doubt be largely increased in the future, the percentage of profit thereon will necessarily be less than heretofore.

PATENT LITIGATION.

During the year the company has been successful in a number of suits in which it has been attacked by the owners of patents which it was charged with infringing. It has been defeated in no such suit. A valuable patent on the Edison form of socket has been sustained by a Court of Appeals. Several important suits on railway patents owned by the company are in progress, some of which will be argued this spring.

ENGINEERING DEPARTMENT.

The work done by the engineering department during the past year deserves special mention. Much has been accomplished in the development of large units, as well as in the perfection of the minor details of manufacture.

The only successful work yet accomplished in the operation of elevated roads by electricity has been done by your company, and it is now engaged in important installations of underground electric conduits for street railways.

In large power generators, in mining and power transmission work, in regulating and measuring devices, and in railway motors, the development and perfection of design have been especially noticeable.

SELLING DEPARTMENT.

The selling organization has been conducted on an efficient and economical basis, and the sales made during the past year have been almost wholly on a cash basis, the average terms of payment on all sales being forty days after shipment.

LICENSEE COMPANIES.

These companies contribute an important part of the business done by your company in central station lighting and distribution of power, and their growth and prosperity are closely identified with the welfare of your own company. The relations which have heretofore existed between these licensee companies and your company continue, and the policy of your company in the future, as in the past, will be to cultivate their business and co-operate in the development of such licensees.

REDUCTION OF CAPITAL STOCK.

At the last annual meeting the following vote was passed:

Resolved, That the matter of reducing the capital stock of the company in the manner prescribed by law be referred to the incoming Board of Directors, with request that they give it attention; and, if such a course commends itself to them, that they call a special meeting of the stockholders for consideration and proper action.

Your board, after careful consideration, has deemed it inexpedient to take any action with reference thereto.

FUTURE BUSINESS.

The indications are favorable for a volume of business in excess of that of last year; but prices are abnormally low, and satisfactory results will largely depend upon the ability of your company still further to reduce the cost of production and distribution of its manufactures.

PATENTS.

The $8,159,264.02 at which patents are carried is the amount at which their value was taken on pages 8 and 9 of the first annual report of your company.

The attention of stockholders is called to the accompanying Balance Sheet and Statements of Profit and Loss.

Attached hereto will be found also the report of the second vice-president, explaining in detail the items on the Balance Sheet and the relation of profit and loss to the business of the current and previous years, and the stockholders are referred to same for details as to these matters.

In closing this report, the president and directors desire to express their thanks for the good work done by the officers and employees of the company in their efficient administration of the various departments.

By order of the Board of Directors,

C. A. COFFIN, President.

SCHENECTADY, N. Y., May 1, 1895.

C. A. COFFIN, ESQ., *President.*

SIR: I submit herewith:

(1) Consolidated Balance Sheet.

It includes the assets and liabilities of the Edison General Electric, Edison Electric Light, and the Thomson-Houston Electric companies, which, for convenience of bookkeeping only, are consolidated with those of the General Electric Company. The assets and liabilities of the Thomson-Houston International Electric and the Pennsylvania General Electric companies were taken over by the General Electric Company during the past year and are also included in this Balance Sheet.

(2) Consolidated Statement of Profit and Loss.

It includes the profit and loss accounts of all the companies above mentioned.

Explanation of the items is as follows:

Assets.

PATENTS AND FRANCHISES.

This account remains at the amount shown in the last two annual reports. It represents, as stated in those reports, the cost to the General Electric Company of the Edison and Thomson-Houston patents and contract rights, and its interest in the patents of the various Thomson-Houston sub-companies. During the year $94,917.11 was expended in purchasing and taking out new patents, and $67,381 in acquiring the territorial licenses which the Thomson-Houston Company had granted to the Thomson-Houston International Electric and the Thomson-Houston Electric Light companies, the latter being the predecessor of the Pennsylvania General Electric Company. These amounts, as well as all expenses of patent litigation for the year, have been written off to profit and loss.

MANUFACTURING PLANTS.

This account represents the real estate, buildings, machinery, tools, etc., at Schenectady, Lynn and Harrison. Their book value at January 31, 1894, was $3,941,128.98. During the year $61,124.34 was expended for new buildings and $268,079.73 for new machinery. On the other hand, $370,333.05 has been written off to profit and loss as an allowance for depreciation, leaving the present book cost of these plants $3,900,000, or $41,128.98 less than at January 31, 1894.

REAL ESTATE.

This account has been increased during the year $100,098.19, chiefly by taking real estate mortgaged to secure old accounts in settlement of those accounts.

STOCKS AND BONDS.

Lists of these securities are annexed hereto in Schedules A and B.

Those having a market value have been taken at book values slightly under the price of recent sales. Where there is no established price it has been necessary to estimate their value from financial statements submitted by officers of the respective companies. Effort has been made to keep the book values of stocks and bonds of "local companies" down to present cash values.

There are stocks and bonds of various companies amounting to $8,500,000 at par, but of so speculative a character that they are carried at a total book value of only $82, being one dollar for each lot. Some of these latter are practically worthless, but others possess some merit and their aggregate value is likely to be considerable.

NOTES AND ACCOUNTS RECEIVABLE.

This account represents what is believed to be a conservative value of notes and open accounts of customers, after deducting and charging off to profit and loss old notes and accounts receivable of 466 debtors, not now dealt with except on a C. O. D. basis, amounting to $2,291,844.48, heretofore carried at $234,973.69, but no longer carried as assets, except for the aggregate sum of $466, being one dollar for each debtor. They will be liquidated as speedily as possible.

INVENTORIES.

This account represents raw materials, goods manufactured and in process of manufacture at the works and manufactured goods on consignment and at sales offices, all at factory cost. They have been inventoried item by item.

Reductions from the sum at which they were previously carried have been made and charged to profit and loss. The continued writing down of manufactured goods is with the intent that only standard salable apparatus shall be considered an asset.

WORK IN PROGRESS.

This account represents the amount expended on installations in progress, without any credit for the profit to be derived from such installations when completed and billed.

Liabilities.

CAPITAL STOCK.

To acquire five shares of common and four shares of preferred stock of the Thomson-Houston Electric Company, which had not been exchanged at the date of the last annual report, three shares of common and one share of preferred stock of this company have been issued during the year.

INDEBTEDNESS.

Pursuant to the policy announced in the last annual report, various stocks and bonds, which it was not desirable for the company to hold permanently, have been marketed. Their proceeds were placed in a special fund. The cost of all securities purchased has been charged to that fund as follows:

Securities were sold for	$1,307,298.07
Securities were acquired at a cost of	1,085 226.56
Leaving a balance	$222,071.51
To this was added from the liquidation of old notes and accounts receivable the sum of	885,996.82
Making a total of	$1,108,068.33

which was used to buy $1.250,000 of the company's debentures in the open market at an average price of about 88⅝.

By liquidating as above, and by adhering to the policy of selling for cash or on short time, the company has not only collected enough cash to retire all its floating and reduce its funded debt, but has had sufficient working capital to pay cash for all its purchases during the year.

The following comparison shows the debt of the company, other than outstanding debentures and real estate liens, on the 31st days of January, 1894 and 1895:

	1894.	1895.
Notes payable	$744,341.31	None.
Accounts payable, accrued interest, etc	446.307.92	494,258.01
Total	$1,190,649.23	$494,258.01
Less cash on hand	591,143.88	404,236.48
Net amount of unfunded debt	599.505.35	90,021.53
Paper indorsed and discounted.	1,422,949 48	None.
Total	$2,022,454.83	$90,021,53

Reduction of unfunded debt	$509,483.82
Reduction of real estate liens	26,200.00
Debentures cancelled	1,250,000.00
Reduction of debt during the year	$1.785,683.82
Reduction of indorsements	1,422,949.48
Total reduction of obligations	$3,208,633 30

PROFIT AND LOSS.

It is difficult to separate losses ascertained during the current year into those properly chargeable to this year, and those due to the errors or misfortunes of previous years. The division of the Profit and Loss Statement has been made with a view to exhibit, as far as it could be distinguished, the profit of the year just ended. The losses incurred on notes and accounts, over and above the allowance made therefor last year, are due largely to diminished values of notes and accounts of customers of the Northwest General Electric Company.

GENERAL EXPENSES.

The general expenses decreased $774.882.09 as compared with the previous year.

Respectfully submitted.

J. P. ORD, Second Vice-President.

CONSOLIDATED BALANCE SHEET, JANUARY 31, 1895.

ASSETS.

Patents and franchises		$8,159,264.02
Manufacturing plants		3,900,000.00
Real estate (other than manufacturing plants):		
Edison Building, N.Y. City	$412,284.63	
Less mortgage thereon	200,000.00	
	$212,584,63	
Other real estate	211,198,79	
		423,783 42
Stocks and bonds (see Schedules A and B)		5,079,012.51
Cash	$404,236.48	
Notes and accounts receivable	6,550,499.50	
Work in progress	757,087.04	
		7,711,823.02
Inventories:		
At factories	$3,046,014.59	
At sales offices (including consignments	813.654,39	
		3,859,668.98
Sundry debits		27,989.09
Profit and loss		14,794,716.97
		$43,956,258.01

LIABILITIES.

Capital stock:		
Common	$30,460,000.00	
Preferred	4,252,000.00	
		$34,712,000.00
Five per cent. gold coupon debentures		8,750,000,00
Accrued interest on debentures	72,916.65	
Accounts payable	421,341.36	
		494,258.01
		$43,956,258.01

SUPPLEMENTARY CONSOLIDATED PROFIT AND LOSS ACCOUNT OF JAN. 31, 1894.

Balance January 31, 1994		$12,454,967.42
Losses chargeable to further liquidation of last year and previous years' business:		
Sundry liquidation accounts.	$264,048.36	
Claims against Northwest General Electric Company.	456,484.43	
On account of settlements with United Electric Securities Co. of bond transactions under T.-H. Electric Company's contracts	46,382,86	
Old notes and accounts receivable wholly charged off	234.973.69	
Sales of plants and real estate below book values	41,501.97	
		1,043,391.31
Special allowance		2.000,000.00
		$15,498,358.73

Profits belonging to last year's business:		
Discount on debenture's purchased	$141,931.67	
Sales of stocks and bonds in excess of book values	147,067,37	
		$288,999.04
Balance carried down		15,209,359.69
		$15,498,358.73

CONSOLIDATED PROFIT AND LOSS ACCOUNT OF JANUARY 31, 1895.

Adjusted balance of January 31, 1894			$15,209,359.69
Business of the current year:			
Cost of goods sold.	$9,557,827.69		
Legal and general expenses, taxes.	1,894,536.29		
		$11,451,863.98	
Interest on debentures		464,583,33	
			11,916,447.31
Losses chargeable partly to previous and partly to current years' business:			
Consignments and contracts written off		184,772.96	
Additional depreciation allowed for:			
On plants, consignments, contracts	177,417.50		
On notes and accounts receivable	130,833.50		
		308,251.00	
		443,023.96	
Further amounts now charged off:			
Patents and franchises	162,298.11		
Various inventories	288,401.14		
Sundry losses	38,798.34		
		489,497.59	
			932,521.55
			$28,058,328.55

Business of the current year:			
Sales	$12,540,395.12		
Royalties and sundry profits	420,818.17		
		$12,961,213.29	
Interest and dividends on securities owned	187,946.81		
Interest and dis.	114,451.48		
		302,398.29	
			$13,263,611.58
Balance, January 31, 1895			14,794,718.97
			$28,058,328.55

Is the Report Correct?

Many Points Which Need Explanation.

Some Which Do Not.

The report of the G. E. Company here printed differs in points of its make-up from the two which have preceded it. The second vice-president of the company has evidently made progress in the art of bookkeeping. The report is ingeniously prepared, so much so that the experts of the daily press have been utterly flabbergasted in their efforts to analyze it. Analysis of it by any one not familiar with previous reports and with trade conditions would be an impossibility, and it is therefore with a pardonable sense of duty done to the 7,000 stockholders of the company, to its competitors and to the public generally that we have made a careful study of it, and present the results of expert work in a comparative table.

Almost in the first paragraph comes the admission of the worthlessness of Northwest G. E. In April, 1893, ELECTRICITY stated in clear and positive language that this concern was worse than worthless. A little later we charged that it would yet cost the parent company a large sum of money to make good its guarantees in financing the Northwest Company. A portion of this amount, only $500,000, is confessed to in this report. The sum is not large enough. The total liabilities of the G. E. Company through the Northwest fiasco is to-day nearer $2,000,000 than $500,000 and will so appear if looked into carefully.

The claim against the Ft. Wayne Company's receiver, $1,187,000, is clearly manufactured and absolutely worthless—why it should have been mentioned is a mystery. It is too transparent a humbug to pass muster even in a G. E. report.

The statement that $414,000 net was earned is an absurdity. No mention is made of the unpaid cumulative dividend on the preferred stock, which is piling up at the rate of $297,000 per annum. Two years' dividends are now due. Thus by this one item the so-called net earnings are reduced to $117,000, and the actual liabilities should have included the $594,000 now overdue and which must be paid before any other dividend can be declared.

Although in the first report great stress was laid upon the company's patent strength and the great value of its patents, this subject is passed lightly by this year. No mention is made of the loss of two of the most valuable patents, the Edison feeder and main and Thomson regulator patents, declared void during the year. The loss of the lamp patent is mentioned, but nothing has been taken off the patent account after the loss of the three strongest and broadest patents. This is not honest bookkeeping, but it should mislead no one.

Now we come to an item which fortunately does not rest upon mere opinion. The facts are all presented over the signatures of Messrs. Coffin and Ord. Mr. Coffin says: "The average terms of payment on all sales during the year were on 40 days after shipment."

Mr. Ord gives the total sales at $12,540,395.12.

Counting 300 days in 1895, then two-fifteenths of the total sales should be on the books. Two-fifteenths of $12,540,395.12 equals $1,672,052.68, whereas the book accounts are given at $6,550,499.50. The difference is $4,878,446.82.

The evidence is therefore plain that $4,878.446 of the book accounts have been carried for over a year—have been carried, in fact, because they were uncollectible. It is more than probable that $3,000,000 must sooner or later be written off from this item of assets. For the stockholders who hope to have an honest report of the condition of their property here is plenty of food for thought.

Moreover, the business was not all done on a cash basis. Over one million, or one-twelfth of the total, was done for stocks and bonds. What will be the shrinkage on this item next year?

With the views of business evidently held by the management we do not wonder that they have deemed it inexpedient to reduce the capitalization. Such a move would have created discussion, and it would take very little discussion to bring out the fact that, with the present report as a basis to begin with, the entire capital stock of the enterprise should be wiped out. Interest on the bonds is all that can possibly be earned under the present management, and the live assets are scarcely sufficient to cover the bonds.

When we reviewed the first report of this company it was charged that our criticism as to overvaluation of assets was too severe; but the appearance of last year's report, acknowledging a shrinkage of over $12,000,000, went a long way to convince the public that we knew exactly what we were talking about. We did. Moreover, we have not been without expert advice from men who know every detail of the Edison, T.-H., and G. E. Co's business from the beginning up to the present time. Last year, under the pretence of great frankness, another lying, or at least false, report was issued. We so charged. This year we find a supplementary profit and loss account acknowledging that more than $3,000,000 should not have been added to last year's total deficit. So it will be next year. The company will be compelled them to admit that the statements here made by ELECTRICITY are nothing less than absolute truth. There are stockholders who should profit by this review. They can profit only by organizing to overthrow the present management in its dishonorable entirety and put in new men who will conduct their business in a sensible manner and present honest reports of its condition.

This management has played upon the credulity of the public so long that perhaps nothing in the way of attempted deceit ought to surprise us. But in this report an attempt is made to mislead with such outrageous impudence that it is at least worthy of special mention. We refer to the manipulation of the stock and bond account.

In the balance sheets the two items are grouped together this year, and it is necessary to consult in detail Schedules A and B. In these schedules the par value of the different items is given with the totals. The fact to which we wish to call attention is that these holdings have apparently increased $5,440,944.34.

Last year, in the foot notes accompanying these schedules, it was stated that in addition to the holdings specified the company had other stocks and bonds to the amount of about $10,000,000 carried at about $5,000. It is, of course, from this list of cats and dogs, grouped together last year as practically worthless, that the additions this year have been made. But why, in the name of all that is honest, should Mr. Ord have turned resurrectionist and gone into a graveyard to find stuffing for his report?

There is only one answer. He places such a low estimate on the intelligence of the G. E. stockholders that he thinks they will swallow anything. The par values of these resurrected stocks and bonds look large as given, and help perhaps to create the impression that there are still good assets to be sold which will produce money enough to continue a losing business. Mr. Ord and the G. E. directors fool no one but themselves by these methods.

The accompanying comparative table is easily understood. It was made up by the same expert accountants who compiled the one we printed in 1894. It is correct. It is made up chiefly from the figures given in the four official statements of the company. Not one figure has been changed. Not one item manipulated. It is just such a table as is prepared annually by every concern desiring to know the actual results of business from year to year. It shows an average loss for the 32 months' business of this company of nearly $750,000 per month. If the estimates of assets given by the company were correct, the total deficit would be several millions larger. This charge will be proved to be correct before the year is over.

The following estimates were made after the publication of last year's report by three gentlemen who had assisted officially in preparing the report. The figures here given show their personal views on the matter, which they were not allowed to express as officers. The estimates explain themselves, showing the deductions which should have been made last year if the report had been an honest one:

Assets claimed		$33,478,481.81
Deduct from:		
Patents and franchises	$8,000,000	
Manufacturing plants	1,000,000	
Stocks of mfg. companies	2,200,000	
Stocks and bonds of local co's.	2,200,000	
Notes and accounts receivable.	4,000,000	
Inventories	1,000,000	
Sales office stocks	750,000	
	$19,150,000	$19,150,000.00
		$14,323,481.81
Liabilities acknowledged other than stock		$11,216,849.23
Deduct:		
Bonds retired	$1,000,000	
Notes (said to be paid)	744,341.31	
	$1,744,341.31	$1,744,341.31
		$9,472,507.92
Summary:		
Live assets		$14,323,481.81
Bonds outstanding		9,000,000.00
Leaving		$5,323,481.81

as against the $34,711,600 of stock issued; for it must be remembered that the preferred stock is not preferred in liquidation but as to dividends only.

Dividing $5,323,481.81 by $34,711,600.00 we find that the entire issue of stock was then worth about $15 per share according to the most liberal estimate possible twelve months ago.

In view of this year's report there is no denying that the condition of the enterprise is much worse than it was last year. If the report means anything it means that the present management have about reached the end of their rope. One more year and they will be wound up by the courts.

The manufacturer will first desire to learn, not the general condition of the company, but the results of the year's business. This is easily arrived at.

Total sales are given at		$12,540,395.12
Securities taken	$1,065.226.56	
Worth on basis of previous securities taken	361,775.52	
Shrinkage in securities		$723,451.04
Leaving cash values of sales without allowance for bad debts		$11,816,944.08
Cost of goods sold		$11,451,863.98
Interest on bonds and preferred stock		762,223.33
Total fixed charges		$12,214,087.31
Deduct cash value of sales		11,816,944,08
Loss		$397,143.23

In addition there has been charged off for the year's operations as follows:

Cost of patents, etc	162,298.11	
Depreciation of inventories	288 401.14	
Sundry losses	38,798.34	
Total		489,497.59
Actual loss for year's manufacturing business		$886,640.82

The above result is the only one that can be reached from the company's own figures.

Not one man in the trade, however, believes the total sales of the company to have been $12,000,000.

ELECTRICITY is perfectly familiar with the style of bookkeeping of this concern, and we charge that this account has been intentionally manipulated. The actual facts are that the total is a trifle over $9,000,000 for the year. The bookkeepers have done the rest.

There is absolutely no hope for the stockholders of the G. E. Company under the present management, and we call particular attention to the warning which Mr. Coffin gives:

"Prices are abnormally low and satisfactory results will largely depend upon the ability of your company still further to reduce the cost of production."

Prices are low, and the G. E. management are solely responsible.

And in estimating the probabilities it must be borne in mind that the prices during the year ended Jan. 31, 1895, averaged 25 per cent. more than present prices.

It is therefore not hard to forecast the ultimate end of this swindling enterprise.

The insiders will continue to manipulate the Wall Street annex to the business. They will make millions upon the millions already made. Every available asset will be sold to pay current expenses. Then the credit of the company will be forced to the full limit.

After this, humbuggery and thimblerigging will no longer avail and the courts will take control.

The end is near.

General Electric's Load Line.

The Westinghouse Machine Company's New Works at East Pittsburg.

Contracts have been let and ground broken for the Westinghouse Machine Company's new shops at East Pittsburg. A few years ago the Westinghouse Air Brake Company erected large shops at a point on the main line of the Pennsylvania Railroad about twelve miles from Union Station, Pittsburg, where the town of Wilmerding was laid out and built. The location at East Pittsburg of the Westinghouse Electric and Manufacturing Company's immense plant, and the Fuel Gas and Manufacturing Company's factory, to be followed now by the removal of the Westinghouse Machine Co. to the same place, will form, with the Union Switch and Signal Company's works at Swissvale, a concentration of Westinghouse interests practically at one point, within a half-hour's ride of the city.

The main building of the Westinghouse Machine Company's new shops will be 602 feet by feet.

Within the main building, through which switches are run direct from the main line of the Pennsylvania Railroad, will be the machine shop, erecting shop, foundry, pattern shop, warehouse, offices, etc. Two crane runways, each 60 ft. span, on which electric cranes will be used, extend the length of the building. The remaining space is taken up with galleries provided with lighter crane service. The present equipment of machine tools will be increased by the addition of whatever is best to facilitate the manufacture and handling of the company's enormous product.

The hammer shop will have every convenience that the best shop practice can suggest for doing work thoroughly and expeditiously. It will be equipped with one 8 ton, one 3 ton, one 2-ton and several smaller hammers, besides the usual cranes, etc.

It is estimated that the cost of the buildings alone will reach $400,000. The contracts call for completion November 1.

General News.

What is Going on in the Electrical World.

Oswego, N. Y.—Mr. A. Emerick, the receiver of the street railway, has appointed Charles S. Barrett general manager of the road.

Appleton City, Mo.—It is announced that an electric railway line will be built from this town to Monegan Springs, a distance of twenty three miles.

Auburn, N. Y.—The Auburn City Railway Company has been granted a franchise to operate an electric railway in certain specified streets of this city.

Conway, Ark—An electric light company is being organzed here for lighting the town and stores. Twenty arc lamps will be located on the streets.

Fayettevilie, N. C.—The General Assembly has had laid before it "An act to authorize the city of Fayetteville to establish and operate a system of electric lights and motive power."

Greenbush, N. Y.—The receiver of the Electric Manufacturing and Gas Engine Company of this place will sell the company's property on the 20th inst. at the city hall at Troy.

Poplar Bluff, Mo.—C. G. Brockman, of the St. Louis Electrical Engineering Company, has been granted permission to submit an ordinance to the council providing for the construction of an electric light plant in this city.

Port Huron, Mich—Detroit and Port Huron capitalists are to build an electric railway line from Port Huron to Algonac and Chesterfield. Mayor N. S. Boynton, of Port Huron, is one of the originators of the company.

Onaraga, Ill.—An electric light franchise for ten years has been granted by the Onaraga village board to J. E. Owen, of this place. By the terms of the ordinance the plant is to be in running order within ninety days.

New Brunswick, N. J.—The franchise of the local street railway has been purchased by Gottfried Krueger and Andrew Radel, of Newark. The road will be equipped with the trolley system and extended to Bound Brook, Milltown and South River.

Oneida, N. Y.—Charles E. Remick and other local moneyed men have formed a company and will apply for a charter with the purpose of putting in an electric light plant in this city because of the failure of the old company to furnish satisfactory lights.

Staten Island, N. Y.—The State Railroad Commissioners have granted the Staten Island Midland Electric Railroad Company permission to use the overhead trolley system from the Richmond turnpike to Clove road, to Oak street, to the Richmond road.

Buffalo, N. Y.—The Buffalo and Gardenville Electric Railway Company, capital stock $40,000, will shortly apply for incorporation. Assemblyman Schoepflin is the principal promoter and the other shareholders are Buffalo capitalists A large portion of the stock has already been subscribed.

Rahway, N. J.—The Regina Musical Box and Electrical Manufacturing Company of Jersey City, a branch of a concern in Leipsic, Germany, intend to remove their plant to Rahway and establish a large factory here, adding about 400 persons to the population.

Belleville, Ill.—The Belleville Electric Railway has been transferred by G. W. Atterbury to Col. Casimer Andel as trustee for Belleville creditors who advanced $23,000 a year ago to aid in its construction. Mr. Atterbury has an option of repurchase within thirty days.

Indianapolis, Ind.—The Rockwood Manufacturing Company of this city have made a shipment of paper pulleys to Osaka, Japan. They were purchased by the International Electric Light Company of Boston, to be used in an electric plant at Osaka to operate a street railway.

Brooklyn, N. Y.—It is reported that all the money needed to build a bicycle rail road on Long Island has been subscribed. A company will be organized in a few days to carry out the project.—The Nassau Electric Railroad Company will open its first line, that from the foot of Broadway in this city to Canarsie, on May 10.

Danville, Ill.—W. S. Mathias has obtained the privilege from the board of supervisors of Vermillion county to construct and operate for twenty years an electric railroad on the Chicago and Danville highway from Danville north to Iroquois county. The line will be over thirty miles long and will touch the towns of Bismarck, Alvin, Rossville and Hoopeston.

Middletown, N. Y.—The Rev. C. M. Winchester has planned for an electric road from Middletown to Slate Hill, Johnson, Westtown, Unionville and Deckertown, with a probable extension to Port Jervis, and has received assurances from parties interested in the construction and operation of electric roads that make him hopeful of the ultimate success of the scheme.

Long Branch, N. J.—The stockholders of the Long Branch Lighting Company have disposed of their gas and electric light plants at this place to the New York Gas Improvement Company, of New York City, at their par value, $187,500. The electric light plant takes in a larger territory than does the gas plant. It has seventy miles of wires. No change will be made in the local management.

Hempstead, L. I.—The Governor has signed the bill amending the charter of the village of Hempstead, N. Y., empowering the board of trustees of said village to contract with an electric light company or with any person or persons or corporations authorized by law to furnish electric lights for lighting the streets and public highways within the incorporated district of the village.

Wabash, Ind.—James Lynn, of this city, has applied for a franchise for an electric street railway in Wabash. He represents Worcester (Mass.) capitalists, who say that if a franchise is granted they will begin work on a complete system here within ninety days. It is the intention to lay about five miles of track at the outset, extending to the corporate limits at the four cardinal points of the compass, and to make extensions as needed.

Camden, N. J.—The Egg Harbor City Water, Electric Light and Power Company, which obtained a contract by ordinance to furnish Egg Harbor with light and water, organized at Camden recently by the election of the following officers: President, Theo. H. Boysen; secretary, Robert Ohnmeiss; treasurer, Harry May. Directors: John Roesch, Christian Atz. The contract for construction has been awarded to W. W. Taylor.

Richmond, Va.—The common council have voted to renew the contract with the local electric light company for another year. They had passed an ordinance opposing the making of a new contract for electric lighting and virtually reinstated gas, but the public would not stand such tomfoolery and became so determined in their demands that the councillors hastened to revoke the ordinance and Richmond remains in the list of electrically lighted cities.

Canton, O.—Hon. W. A. Lynch, president of the Canton and Masillon line, is manifesting an active interest in the projected electric railway from this city to Albion, and with him are citizens of New Berlin, Uniontown, Greentown, Krumroy and the other places along the way. The idea is to have the line connect with the line already commenced from Akron to Cleveland, thus giving a direct electric line from Canton to Cleveland.

New York.—The stockholders of the Edison Electric Illuminating Company have voted to issue the 100-year gold bonds to an amount not exceeding $15,000,000, bearing interest payable in gold at net rates as the board of directors shall determine from time to time as the bonds are issued, the rates not to exceed 5 per cent. per annum. The company will mortgage its property and franchises to secure the payment of such bonds.

Freehold, N. J.—Papers have been filed here of a million dollar mortgage given to the Knickerbocker Trust Company of New York by the Atlantic Coast Electric Company, which controls the trolley system through Asbury Park, Long Branch and other places along the coast, from Point Pleasant to Pleasure Bay, where it will connect with a line of steamers running to New York; and also controlling a line from Long Branch to Atlantic Highlands.

Dover, Del.—The Henlopen Electric Light and Railway Company have applied to the Legislature for an act of incorporation. The company is to operate an electric railway from Lewes to Rehoboth or to any other place in Sussex County. The incorporators are Dr. Hiram R. Burton, Harry V. Lyons, John Barnes, Charles C. Stockley, Robert G. Houston, Daniel Burton and John M. Richardson. The capital stock is to be $250,000, with power to increase to an unlimited amount.

Chattanooga, Tenn.—The light committee of the city council have decided to invite bids for a new contract for electric lighting, the present contract expiring on the 25th of August next. The city will ask bids for a lighting contract for 2,000 C. P. arc lights, on a basis of 175, 200, 225 and 250 lights, and 100 16 C. P. incandescent lights. Bids are also asked for the erection of a municipal electric lighting plant in the city with a maximum capacity of 300 2,000 C. P. arc lights and 100 incandescent lights, the bids to include everything for an electric plant except the building, the estimated area to be wired being four square miles.

Telephone and Telegraph.

W. B. Mullen has been canvassing Alice, Tex., in the interest of the Alice, Wade City and Corpus Christi Telephone Company with considerable success. The line will be extended to Santa Gertrude and likely to other big ranches. It will be a great convenience, especially to ranchmen and prospective buyers.

The Mammoth Spring Electric Light Company of Mammoth Spring, Ark., are authorized under their articles of incorporation to build and maintain telephone lines.

The construction of a telephone line from Winona, Minn., through Fountain City to Waumandee is being advocated. Nearly enough money has been pledged to build the line, and it is probable its construction will be begun at an early date.

The New York and New Jersey Telephone Company has completed arrangements for the extension of its lines at once to nearly all of the towns and villages of Long Island. Work is progressing rapidly on the new long distance telephone line extension from Glen Cove to Huntington and Northport.

Thomas Dixon, of Henderson, Ky., has been granted a patent on an invention which will prove important if Mr. Dixon's claims as to the advantages of the patent pan out. The name of the invention is the "Sextoplex." It is claimed that the invention will enable six telegraph operators to work on one wire at the same time.

Huddleston & Woodin of Chicago, grantees of the telephone ordinance recently passed by the Eau Claire (Wis.) council, have accepted, and have prepared plans and estimates for exchanges at Eau Claire, Chippewa Falls and Menomonie. They have a franchise at Chippewa Falls, and only await the granting of a franchise by Menomonie to begin work.

The Central Union Telephone Company has declined to accept the proposition of the Home Company at Wabash, Ind., to leave the field if the former company would name a rate of $2 a month for business houses and $1.50 for residences. The Central Union proposes to put in a first-class exchange, make a rate of $3 for business houses and $2 for residences and fight the local company to a finish.

Articles of incorporation are being prepared or the new Citizens' Telephone Company at Tampa, Fla.

Messrs. Wilkerson & Davis have organized a telephone company at Marion, Ala , known as the Marion Telephone Company. A local exchange is in operation, and the company are putting up lines connecting Marion with the business centers of South Alabama.

The Pittsburg, Pa., papers state that a new telephone company has been formed in that city and will apply for a charter at once. The company is composed of prominent business men who are desirous of giving Pittsburg a cheaper and better telephone service than it now enjoys.

The Jones Bros. Electric Company have applied to the authorities of Cincinnati for permission to string telephone, telegraph and fire alarm wires and erect poles therefor to enable them to start a district messenger company in that city. The matter was referred to the Committee on Light.

The Nolachucky Telephone Company, which intends to operate a telephone system, will make Jonesboro, Tenn., the central office. Charles Seymour, of Knoxville, Guy R. Johnson, general manager of the Embreeville Iron Company, Capt. A. S. Deadrick, J. H. Epps and W. P. Brownlow are the charter applicants of the company. The franchise embraces Jonesboro and Johnson City.

The Railroad Telegraphers' Convention, to be held at St. Louis on the 21st inst., is likely from present indications to have a large attendance of delegates from all parts of the country. A strong appeal will be made to the members to establish the national headquarters of the order at Peoria, Ill.

The Board of Public Works of Louisville, Ky., have approved the ordinance presented by the American Telegraph and Telephone Company for the right of way for its poles and conduits through the city. The ordinance provides that no poles shall be put in the center of the city, and that all of the wires there must be underground.

Through the efforts of Messrs. Sanborn & Randall a telephone system connecting Ostonville, Minn., and Big Stone City, S. D., has been established, and business men in both cities are having telephones installed in their offices and stores.

The Oshkosh Northwestern Telephone Company has been organized at Oshkosh, Wis., with a capital of $20,000. A franchise has been granted the company, and 280 subscribers are already assured. The exchange will be in operation by the last of June.

Dr. W. W. Bradley is extending his telephone line from Forman, N. D., to Lisbon and will eventually extend it to Fargo.

R. K. Van Etten & Sons have planted poles from Dingman's Ferry to Milford, N. Y., for a telephone line. The wire has not yet been strung and the enterprise is delayed somewhat by opposition, but the projectors hope to overcome all obstacles and have the telephone in running order this summer. It is their intention to extend the line to Port Jervis.

The Kearny Electric Light Company, of Kearny, N. J., incorporated a few days ago by Geo. F. Woolston, jr., and others, will conduct a telephone business as well as lighting.

The bill repealing the ordinance granting the franchise to the Mutual Automatic Telephone Company of Philadelphia has been favorably reported by Councils' committee on law.

The stockholders of the Oshkosh (Wis.) Northwestern Telephone Company have elected the following officers: President, W. J. Hay; vice-president, F. L. Humes; secretary, T. A. Rockwell; treasurer, Charles Schriber. Directors: E. E. Stevens, T. A. Rockwell, W. J. Hay, Charles Schriber and J. H. Jenkins. The work of construction will be pushed with all possible rapidity.

Secretary E. W. Stamm of the new telephone company, which has applied to the city council of St. Louis for a 50-year franchise to operate in that city, says: "We claim a system that is better than that used by the Bell people. William J. Kurtz, Vandalia, Ill., the inventor, has it in successful operation in Decatur, Ill., and St. Joseph, Mo. St. Louis, 600,000 strong, has 4,000 telephones, and ought to have 10,000. Why not? Because $80 for residence, $100 for business and $120 for public telephones is too steep. We will not charge over $60 and $48 for business and residence purposes."

Test of the Hogan Boiler.

The committee appointed in behalf of the invited guests to supervise the test of the Hogan Vertical Water Tube Boiler at Middletown, N. Y., on April 9, described in our issue of April 17, consisting of Paul H. Grimm, chief engineer National Starch Manufacturing Company, Glen Cove, N. Y.; M. N. Forney, editor *American Engineering and Railroad Journal*, and John Hopson, Jr., of Hopson & Chapin Manufacturing Company, New London, Conn., has made its report as follows:

Very complete arrangements were at hand for measuring the feed water in a tank which was graduated to read in pounds of water. The temperature of the feed water was read from a thermometer inserted in the feed pipe. The steam pressure was recorded by an ordinary steam gauge and also by a recording gauge. The coal, which was of lump anthracite kind, was weighed on a scale in the boiler house.

The members of the committee having satisfied themselves as to the correctness of the conditions, and having examined the fire and the water level as indicated by the gauge glass on the boiler, directed that the blower be started for a test of evaporation under forced draft, to last thirty minutes.

The blower was started at 2.23 P. M. The water in the feed tank at this time indicated 4,600 pounds. The temperature was 44 degrees Fahr. The steam pressure averaged during the test 120 pounds. The steam was allowed to escape through the safety valve, also through a pipe (controlled by a valve) into a tank outside and above the building. The pressure of the blast was not measured owing to an unfortunate disarrangement of the gauge, but in the opinion of the members of the committee was about 1¼ inches.

No facilities were at hand to make a calorimeter test of the steam, but a one-inch pipe located on the top of the boiler was from time to time opened full and the steam examined. It appeared to be practically dry. The temperature of the terminal gases was not taken.

At 2:53 the blast was stopped, and the pump, having been found unable to keep up with the demand for water, was allowed to run a few minutes longer in order to bring the water up to the mark. The fire was inspected and a little more coal put on to bring it up to what the committee considered was its condition at the start.

When the feed pump was stopped, it was found that the tank contained 2,200 pounds of water, thus showing an evaporation of 2,400 pounds of water in thirty minutes from 44 degrees temperature into steam of 120 pounds. The coal used was 350 pounds, which gives an actual evaporation of 6.86 per pound of coal, or an equivalent evaporation from and at 212 degs. of 8.35 per pound of coal. On this evaporation the boiler developed 168 H. P. The evaporation of water per square foot of heating surface per hour was 7.02 as follows:

$$\frac{\text{4,800 lbs. of water evaporated from and at 212 degs.} \times \text{1,215 factor of evaporation}}{\text{850 square feet of heating surface.}} = 7.02$$

The boiler contains 830 square feet of heating surface and 26 feet of grate surface and was rated by the company as a 100 H. P. boiler.

All things considered, the performance of this boiler was very remarkable, and those present expressed themselves well pleased, not only with the behavior of the boiler, but also with the general arrangement and mechanical construction of the boiler.

Cutter's Specialties.

George Cutter, of Chicago, issues a neat little booklet, illustrating many of his well-known devices for street-lighting uses.

Supplies for the War Department.

The War Department, through the Office of Public Buildings and Grounds, Washington, D. C., is asking for proposals until May 28 for the quantities of battery supplies, more or less, mentioned below, for the use of the public buildings and grounds in charge of that office during the fiscal year ending June 30, 1896:

300 gravity coppers, 5 x 7 and 6 x 8 inches. These coppers must be made from the best metal, the 5 x 7 inch to weigh not less than 1¼ ounces each; 6 x 8 inch to weigh not less than 2 ounces each.

100 crowfoot zincs, 5 x 7 inches, to weigh not less than 1¾ pounds each.

400 crowfoot zincs, 6 x 8 inches, to weigh not less than 8¼ pounds each. These zincs must be made from carefully selected spelter; if made from scrap metal or dross they will not be accepted.

2,000 pounds bluestone, best quality.

10 pounds sal-ammoniac, best quality.

300 pounds No. 12 K. K. line wire.

100 pounds extra best No. 12 galvanized line wire.

20 pounds No. 16 office wire, Phillips' patent braided.

24 6-inch battery jars.

6 zincs for Le Clanche battery.

10 pounds Grimshaw ¾ inch splicing compound.

Additional information may be had by addressing Col. J. M. Wilson, War Department, Washington, D. C.

Economical Steam Production.

Messrs. Babcock & Wilcox, who sold the first boilers to electric light plants in America, still maintain their position in the front rank of American boiler makers.

They have just issued two of the most artistic trade publications of the year, entitled "Steam" and "Facts."

The illustrations in the latter show the various stages of boiler development, and make clear the reasons for many of the failures that have marked the progress of steam production for fifty years.

Both books are bound in boards, and are worth sending for and preserving.

The Capo-Farad Battery and Appliance Works.

Jas. J. Pearson has taken the Capo-Farad manufactures entirely out of the hands of the Nassau Electrical Company, and will in future manufacture them, together with other electrical goods, under his own name. His offices are at Thames and Greenwich streets, New York.

Clark Electric Company.

The Clark Electric Company have moved their office from 192 Broadway to their factory, 478 and 480 Pearl street, between Centre street and Park Row.

Universal System for the Distribution of Light and Power from the Same Conductors.

Under the above title the Siemens & Halske Electric Company have recently published in pamphlet form a brief argument in favor of the direct-current low tension system. Among other things they say:

For plants in cities and towns where the power-house can be located near the center of lighting, we use the direct, 220 volt, two-wire (multiple arc) system of distribution, for the following reasons:

Public and private arc lights, incandescent lights, and electric motors can be operated from a single dynamo, preferably direct-connected to engine or water wheel.

The low pressure system involves no danger to life, eliminating the possibility of the owner of the plant being made a defendant in damage suits. This is important, as the long list of fatal accidents from high pressure systems (alternating incandescent and series arc) demonstrates.

The original cost of this system is usually less than that of a high speed, high pressure system. Recent determinations made for several cities show that while often more copper wire is needed, one dynamo is used in place of from four to six; and no countershafting, belting, friction clutches, transformers or other energy-wasting appliances: less real estate, and a smaller building is occupied.

The cost of operation is from 20 to 40 per cent. less. A single Siemens dynamo of slow speed direct-coupled to a good engine costs less to operate than half a dozen high-speed machines belted to a shaft. We save in friction, oil, repairs, attendance, wear and tear, and we obtain a higher efficiency.

The loss of energy due to the use of belts in installations operating under very favorable conditions, as assumed by leading companies in the United States, is as follows:

LOSS OF ENERGY IN—

Horizontal belts	6	per cent.
Vertical belts	10	"
Countershaft with horizontal belt	12	"
Countershaft with vertical belt	16	"
Slow-speed engine with main and countershaft and belts	25	"

By direct-connecting, these losses of course are eliminated.

We use 220-volt incandescent lamps, which make the third wire of the so-called three-wire system unnecessary, and we dispense with expensive energy-consuming equalizing rheostats and complicated machinery at the station.

We obtain, therefore, all the advantages of the so-called three-wire system, at the same time eliminating its weak points.

220-volt incandescent lamps are now being made and guaranteed by many prominent lamp manufacturers in the United States and by Siemens & Halske in Berlin, and we are now importing the lamps of our parent company.

ADVANTAGES OF ARC LAMPS ON A CONTINUOUS CURRENT CONSTANT POTENTIAL SYSTEM.

1. Low voltage, hence safety to human life, easy maintenance of insulation on lines.

2. Constant potential dynamos of any size may be used as the voltage does not increase with the number of lamps as in the common series system.

3. Constant potential dynamos are of a high efficiency. A 50 K. W. dynamo, for instance, can be guaranteed to be of at least 90 per cent. commercial efficiency.

Series arc light dynamos show an efficiency of about 80 per cent. when new, but after a few years their efficiency will fall to 70 per cent. and often as low as 50 per cent. (See "Electrical Engineer," July 4, 1894, page 5.)

4. Low potential dynamos are seldom affected by lightning. The low potential current cannot follow atmospheric discharges through the insulation.

5. Arc lamps burn absolutely steadily and give a uniform light similar to an incandescent light. Their mechanism is very simple.

6. In case of an accident to any part of the circuit or any lamp, only a few lamps are affected, while in the series system the trouble extends over the whole line.

7. Arc lamps require less energy for the same candle power.

8. The repair bill is very small in comparison with series arc dynamos.

9. Incandescent lights and motors may be operated from the same circuits.

10. Arc lamps may be adjusted to any amperage, hence lamps of various candle powers may be operated from the same dynamo and from the same distributing mains.

MOONLIGHT SCHEDULE FOR THE UNITED STATES.

(Issued by the Washington Carbon Company.)

INCORPORATIONS.

The Collindale Street Railway Company, Collindale, Pa.—to build an electric street railway. Capital stock, $50,000. Promoters: Henry P. Collins, Mt. Vernon; Henry Delaplaine, J. M. West, Jr., Philadelphia, Pa.

The Grayville Water Works, Chicago, Ill.—to construct water works, electric light, heat and power or manufactories, and supply consumers with water, light, heat and power. Capital stock, $5 000. Promoters: Henry A. Gardner, Livingston Griffin, Arthur M. Morgan.

The Mammoth Spring Electric Light and Power Company, Mammoth Spring, Ark.—to maintain and operate a system of electric lights, generate power by electricity and build telephone lines and maintain the same. Capital stock, $100,000. Incorporators: H. G. King, W. D. Cook, M. J. King and M. H. Cook.

The Passaic and Newark Electric Traction Company has filed its certificate of incorporation at Passaic, N. J. Albert C. Jones, Charles A. Stelling and James W. Clinton are the incorporators and their authorized capital stock is $250,000. The paid in capital is $25,000.

The Smithville Water and Light Company, Smithville, Tex.—to furnish water and electric light. Capital stock, $40,000. Promoters: K. H. McCaskill, R. E. McCoy, L. L. McCoy, Smithville.

The Warsaw Water Company, Portland, Maine—to manufacture gas and electricity and machinery and fixtures for gas works, water works and electric light works in city of Warsaw, Kan., and elsewhere. Capital stock, $90,000. Promoters: Wm. C. Eaton, Edw. D. Noyes, Geo. F. Noyes, Portland.

The Eddy Milling Company, Edgecomb, Maine—to manufacture lumber, mill grain and establish an electric plant. Capital stock, $5,000. Promoters: Willis H. Clifford, Irving E. Chase, Fred W. Clifford, North Edgecomb, Me.

The Herbert Kraft Company, Red Bluff, Cal.—to buy, sell, use and construct all kinds of mechanical power, gas and electric lighting plants and works, etc. Capital stock, $100,000. Promoters: Herbert Kraft, Geo. H. Kraft, Edward F. Kraft, Gustave Kraft, Red Bluff.

The United Motor Company, Cleveland, Ohio—to manufacture and deal in electrical instruments, machinery, devices, etc., manufacture, sell, deal in and operate vessels, vehicles and engines propelled by electricity or other power, etc. Capital stock, $10,000. Promoters: H. H. McKeenan, Jas. H. Hoyt, A. C. Dustin, H. A. Kelley, Gustav von den Steiner.

The Sioux Rapids Electric Light and Power Company, Sioux Rapids, Iowa—to establish and maintain an electric light and steam plant. Capital stock, $8,000. Promoters: H. D. Smith, M. P. Smith, Sioux Rapids.

The Grafton Traction Company, Grafton, W. Va.—to own, build and operate an electric street railway from Grafton to Pruntytown, etc. Capital stock, $150,000. Promoters: F. A. Morlan, H. M. Somerville, E. M. Morlan, Grafton.

The Chicago and Montana Mining Company, Chicago, Ill.—to locate and operate mines, mining properties containing gold, silver, copper and iron ore or other ores; operate electric, cable and horse rail, tram and wagon roads, flumes, canals, ditches, etc., telegraph and telephone lines, steam, electric and water power and light plants, together with all machinery and appliances necessary. Capital stock, $500,000. Promoters: Malcolm Dale Owen, Thos. H. Kelley, Edw. Brackett.

The Weaver Jacquard and Electric Shuttle Company (incorporated in W. Va.), Norwalk, Conn.—to manufacture and deal in looms, textile machinery and accessories and mill supplies, etc. Capital stock, $2,500,000. Promoters: Wm. Weaver, Dexter Hitchcock, Edwin H. Mathewson, Norwalk.

The Consolidated Gas Company, Jersey City, N. J., and New York, N. Y.—to buy, build, own and operate gas and electric works. Capital stock, $750,000. Promoters: Jos. C. Davis, Maplewood, N. J.; Henry A. Jones, Geo. Place, New York, N. Y.; Thos. Ewing, Yonkers, N. Y.

The Cleveland, Painesville and Eastern Railroad Company, Cleveland, Ohio—to construct and operate an electric railroad, furnish electric light, heat, power, etc. Capital stock, $250,000. Promoters: Henry A. Everett, Julius E. French, J. A. Beidler, Edward W. Moore.

The Metropolitan Electric Street Railway Company, Chicago, Ill.—to construct, equip and operate street railways to be operated by horse power or electrical devices or other power except steam. Capital stock, $5,000,000. Promoters: Rob't P. Parker, Richard E. Breed, Jas. F. Dagley.

The Toledo Traction Company, Toledo, Ohio—to construct, maintain and operate street railroads and railroads operated as street railroads. Capital stock, $4,000,000. Promoters: Albion E. Lang, Chas. L. Wight, Winfield S. Jewell, Edgar H. Eckert.

The International Forging Company of New York City—to heat and work metals, and to smelt ores and engage in business in which electricity may be used as an agent. Capital stock, $6,000. Directors: James Seager, J. C. Seager, of New York City; Lorenzo Ullo and J. L. Ullo, of Brooklyn.

The Leroy and Northern Railroad Company of Leroy, N. Y.—to operate a steam and electric road in Genesee County, N. Y. Capital stock, $50,000. Directors: C. F. Prentice, D. C. H. Prentice, N. L. Keeney and C. N. Keeney, of Leroy.

The Esmond International Traction Company has filed articles of incorporation with the county clerk in Jersey City, N. J. The company will buy patents and patent rights of appliances for electric traction. They will also deal in material and supplies for electrical traction lines and will furnish equipments. The capital stock is $1,000,000. Incorporators: Chas. C. Dodge, Fred C. Esmond and Henry Seligman.

The Kearny Electric Light Company has filed articles of incorporation with the county clerk of Hudson County, N. J. The object of the company is to supply electric light, heat and power, and do a telephone business. Capital stock, $50,000. Incorporators: Geo. F. Woolston, Jr., Bertha C. Smith, Wm. Hanna and Jos. Randall. The same parties are incorporated as the Esmond Block Signal Company, capital $100,000, for the manufacture of an electric block signal and machinery.

The Freeport General Electric Company, Freeport, Ill. Capital stock, $125,000. Incorporators: William O. Johnson, Newton P. R. Hatch and Charles S. Hatch.

The Consolidated Electric Light Company, San Francisco. Capital stock, $300,000. Directors: G. G. Buckland, H. W. Quitzow, James E. Ball, D. Geary, R. W. King.

The Zanesville and Columbus Electric Railway Company, Zanesville, O.—to build and operate an electric railway between Columbus and Zanesville. Capital stock, $10,000. Incorporators: W. J. Dungwieler, Albert Adams, A. W. Evans, L. W. Doan and S. A. Patterson.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED APRIL 30, 1895.

ELECTRIC RAILROADS AND APPLIANCES.

538,295. Trolley. Judson D. Swacick, Canton, Ohio. Filed Oct. 29, 1894.

538,325. Means for Ventilating Electric Motors on Cars. James J. Devine, Clifton Heights Pa. Filed March 14, 1895.

538,357. Underground Electric Railway John F. Smith, New York, N. Y. Filed Aug. 15, 1894.

538,378. Conduit System for Electric Railways. Frank H. Homan, Brooklyn, N. Y. Filed April 24, 1894.

538,390. Trolley-Breaker. Walter R. Scott, Buffalo, N. Y. Filed Dec. 19, 1894.

538,391. Trolley-Wire Hanger. Walter R. Scott, Buffalo, N. Y. Filed March 5. 1895.

538,408. Electric Transmission Wheel or Trolley. Charles C. Burton, Pittsburg, Pa., assignor of four-fifths to Curtis G. Hussey and John C. Des Granges, same place, Lewis E. Holden, Beloit, Wis., and George M. Ludlow, Chicago, Ill. Filed Aug. 11, 1894.

538,409. Trolley-Wheel Charles C. Burton, Pittsburg, Pa., assignor of four-fifths to Curtis G. Hussey and John C. Des Granges, same place, Lewis E. Holden, Beloit, Wis., and George M. Ludlow, Chicago, Ill. Filed Aug. 24, 1894.

538.569. Trolley-Pole Restrainer. Frank Wheeler, Meriden, Conn. Filed Feb. 8, 1895.

538,590. Block System and Apparatus on Electric Railways. Eugen Langen, Cologne, Germany. Filed July 16, 1894.

538,610. Overhead Trolley. Charles W. Hunt, West New Brighton, N. Y. Filed Feb. 4, 1892.

ELECTRIC LIGHTS AND APPLIANCES.

538,457. Electric-Arc Lamp. John A. Mosher, Chicago, Ill. Filed Feb. 9, 1893.

DYNAMO ELECTRIC MACHINERY.

538,344. Armature for Dynamos and Electric Motors. Harry Penn and Loftus Lowndes, London, England. Filed Aug. 13, 1894.

538.345. Dynamo-Electric Machine or Electric Motor. Edwin H. Porter, Radford, Va. Filed Aug. 11. 1894.

538,351. Electric Engine. Luther M. Sabin, Washington, D. C. Filed April 27, 1894.

538,377. Electric Elevator. Nils O. Lindstrom, Union Course, assignor to A. B. See Manufacturing Co., Brooklyn, N. Y. Filed Feb. 26, 1895.

538,617. Commutator-Brush and Means for Adjusting Same. Robert Lundell, Brooklyn, assignor of two-thirds to Edward H. Johnson, New York, N. Y. Filed July 20, 1893.

TELEPHONE AND TELEGRAPH APPARATUS.

538,327. Telephone Central-Office System. Ezra T. Gilliland, Pelham Manor, N. Y., assignor to the American Bell Telephone Company, Boston, Mass. Filed June 5, 1894.

538,328. Magneto-Transmitter. Ezra T. Gilliland, Pelham Manor, N. Y., assignor to the American Bell Telephone Company, Boston, Mass. Filed June 5, 1894.

538.329. Magneto-Generator. Ezra T. Gilliland, Pelham Manor, N. Y., assignor to the American Bell Telephone Company, Boston, Mass. Filed Nov. 28, 1894.

538,454. Telephone-Switch. Albert F. W. Meyer, Blue Island, Ill. Filed Jan. 11, 1895.

538,474. Art of and Apparatus for Transmitting Speech. John Absterdam, New York, N. Y., assignor, by mesne assignments, of three-fourths to A. Wilford Hall, same place. Filed Feb. 18, 1891.

MISCELLANEOUS.

538.243. Changeable Electric Headlight. William Dibb and Frank C. Rorabeck, Syracuse, N. Y. Filed March 19, 1894.

538.247. Electrical Signaling. Bradley A. Fiske, U. S. Navy. Filed Dec. 20, 1894.

538.271. Electrically and Chemically Heated Crucible. Henry G. O'Neil, Boston, Mass., assignor to Edward Jewell, same place, and Charles W. Welch, Stoughton, Mass. Filed March 24, 1894.

538,272. Electrical Cigar Lighter. Henry G. O'Neill, Boston, Mass., assignor to himself and Edward Jewell, same place. Filed Aug. 27, 1894.

538,275. Electrical Brake. Carl E. Pearson, St. Louis, Mo., assignor of two-thirds to Ernest G. Bruckman and Samuel E. Bruckman, same place. Filed April 2, 1894.

538,278. Boat Propulsion. James F. Place, Montclair, N. J., assignor of one-half to Charles S Upton, New York, N. Y. Filed April 23, 1894.

538,284. Thermal Cut-Out Device. Charles A. Rolfe, Chicago, Ill. Filed Feb. 21, 1895.

538,289. Manufacture of Carbon for Electrical Purposes. Charles P. Shrewsbury, London, and John L. Dobell, Modbury, England. Filed Sept. 10, 1894.

538,320. Magnetic Ore-Separator. John W. Carter, Brooklyn, N. Y. Filed Dec. 30, 1893.

538,359. Process of and Apparatus for Making Compressed Electrolytic Copper. Francois L M. Urruty, Paris, France, assignor to la Societe des Cuivres de France. Filed May 2, 1894.

538.417. Magnetic Ore-Separator. James Houlehan, Chicago, Ill., assignor of a part to Robert Laird, same place, Colin John Basil MacIver and William Henry Laird, Toronto, and James R. Barclay, Montreal, Canada. Filed June 6. 1894.

538,423. Electrical Coupling. Morris F. Koenig and Ira Mann, Hazleton, Pa. Filed Oct. 15, 1894.

538,469. Diffuser for Electric Fans. Charles W. McKeehan and Frederick B. Miles, Philadelphia, Pa. Filed Jan. 17, 1895.

538,628. Method of Making Electrodes for Secondary Batteries. William L. Silvey, Dayton, Ohio. Filed Jan. 23, 1894.

ELECTRICITY.

Vol. VIII. NEW YORK, MAY 15, 1895. No. 18

ELECTRICITY

Published every Wednesday by the
Electricity Newspaper Co.
B. E. GREENE, Pres't. L. J. MONTGOMERY, Sec'y.

PUBLICATION OFFICE:
6 Park Place - New York

EDITORS: NELSON W. PERRY.
BURTON E. GREENE.
R. H. WILLOUGHBY.

BUSINESS MANAGER, - - JOHN L. GANS.

SUBSCRIPTION RATES:

United States,	$2.50
In Clubs of Five or More,	$2.00
Foreign Countries,	$4.50
Single Copies,	10 Cents

ADVERTISING RATES:

As Electricity reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.

Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

Entered at the N. Y. Post Office as Mail Matter of The Second-Class.

TRADE SUPPLIED BY
THE AMERICAN NEWS COMPANY,
THE WESTERN NEWS COMPANY,
And their Agencies in all Principal Cities.

EDITORIAL NOTES.

"Patents and Prophecies." In January last, in discussing the condition of the G. E. Company, the utter absence of any reasonable ground upon which the stockholders might base a hope for return upon their investments, we stated that "$8,000,000 of patent assets must be wiped out this year or next."

Last week we printed comments of the *Evening Advertiser* as follows:

> It will be noticed at once that the "patent" item is unchanged. It seems to us that we have some faint recollection of the able editor of Electricity telling us about the middle of January that "the $8,000,000 of patent assets would be wiped out this year or next, making a further impairment." In justice to Mr. Greene we will defer remarks on this point until the next annual report comes out, so as to be strictly fair.

We suppose that our esteemed contemporary did not publish this so much for the purpose of announcing to the world that Electricity has an able editor as to point out that even an able editor may be wholly untrustworthy as a prophet. A valued correspondent, from whom at various times we have derived useful information concerning patents and their values, has sent us some comment on the subject which we may properly embody in a sermon on the general subject of Patent values and the value of Daily Paper opinions on the condition of large corporations.

Most of the trusts and trade combinations formed in this country in the last few years have been afflicted with a dangerous disease which has in many cases resulted in the utter collapse of the enterprise, and in nearly every case has caused serious injury to the confiding investors in the securities of these companies.

This disease, with its evil consequences, has not been confined to those companies whose securities are not listed on the exchanges, but has been equally prevalent among those so listed, which have been compelled to issue statements from time to time for the information of the public, and whose affairs have been the subject of popular newspaper comment.

Indeed it is among the latter class that the disease has been most virulent, the consequences the most severe. When one of these desires to list its securities a statement is filed with the Board of Governors which at once becomes public property. It is upon this preliminary statement that money is first raised and speculation begins. Then the company must issue an annual report, which becomes public property and usually reaches the financial editor and supposed financial sage of the daily press.

Probably a majority of the readers of the daily paper still labor under the delusion that these financial editors are specially fitted with some peculiar power or genius (either inherited or acquired, or partly both) for at once understanding the exact financial condition of a company and also at once determining the value of its assets and liabilities by mere inspection of the items given in the balance sheet, no matter how utterly ignorant these "financial editors" may be of the actual costs, say, of the production of the commodities, the actual costs of administration of the corporation and the actual market values of the commodities made and sold by it.

Let any man soberly think over the matter and he will at once perceive that a person would have to be vastly more than a walking encyclopedia of technical, scientific and financial knowledge of the most abstruse kind to understand the simple principles of the arts upon which the majority of these large enterprises are based. Combined with this vast fund of information (already too staggering for one human intellect to acquire or carry) he would have to have that keen insight into general business principles possessed by but very few persons connected with such enterprises and a knowledge of the vastly different forms of administration of the business affairs of corporations carrying on industries of such great variety and differing from each other in every particular.

Moreover, he would have to be a skilled accountant to understand the meaning of the complex terms and figures used in such reports, terms not always used in the same sense even in different enterprises and figures which have no real signification whatever of actual values, without a most intimate knowledge of the business to which they relate.

The possession of such knowledge and faculties by one person is manifestly beyond the possibility of human powers, and the assumption of the possession of them by any person may at once be accepted as a certain indication of insanity of a most virulent kind.

But such is the faith of some people in the gullibility of mankind that certain newspaper writers appear to be always ready to write upon any subject with perfect confidence notwithstanding the fact that they may not have the least knowledge of the subject.

We are pleased to say that the financial editor of the *Commercial Advertiser* is one of the few of his class who *try* to do their duty by the public. He does not knowingly print falsehoods, and is proof against the influence of the press agent.

We take Mr. Dow's item as a text, therefore, merely to point a general moral.

If the financial editors of the city would pay more attention to the discussions in the leading trade papers, they would absorb a certain amount of knowledge in regard to large corporations which is lacking now.

What ground have these writers now got to stand on in claiming to be safe guides for the public to follow in matters of investment? What company's affairs have they handled in a way to warn the public of impending collapse? Of the disastrous failures of the past five years in Wall Street, what one has been pointed out in advance by a financial writer? Yet this is exactly what the public needs. Discussion of the affairs of the Whiskey, Cordage or G. E. trusts, after the public have been robbed of millions, does not come up to the standard of what the daily press should do.

ELECTRICITY'S prophecies are on record; the progress of events is also on record. We have made no mistake in regard to matters in our own trade. We do not go beyond our sphere. What we discuss is limited to matters upon which we have full knowledge.

When G. E. stock was selling at 118-19 we went on record with a prophecy that it would sell at less than 50 inside of two years. We showed why it must do so. We endeavored to prevent the insiders from unloading their stock upon the public at fictitious values. We worked, not for spite, but to save the trade we represent the disgrace of another swindle; for the G. E. fiasco was nothing less. We did not wholly prevent it, but we did prevent the issuing of the remaining $16,000,000 of treasury stock, which, without our exposure, would have been sold. ELECTRICITY was SIX MONTHS IN ADVANCE of any other journal in the world in pointing out the rottenness of this enterprise.

If what the daily papers said in 1892 had been fully believed, G. E. stock would have gone to 150 and $16,000,000 more stock would have been unloaded.

What good is accomplished by these daily paper financial writers we fail to see. They would need more ability than a bank president or than a Secretary of the United States Treasury to treat the affairs of all the different companies intelligently and originally. It seems to us that the best thing they can do is just what our friend of the *Advertiser* is doing of late—copy the comments of the trade papers, which are supposably written by men who understand all the intricacies of the trades they represent. Then the public can do a little independent thinking.

The strongest proof of the inability of these writers to be of any service to the public is found in their treatment of the G. E. report this year. Many of them, we know, wanted to handle it fairly and intelligently. Yet not one analysis of it appeared worthy of the name. Why? Simply because they do not understand any of the details of this business.

They saw a claim of $12,500,000 gross sales and $400,000 net profits. They did not endeavor to forecast what would be the result of another year. Information was within their reach showing that the product of this company is now being sold at an average of 25 per cent. less than it was during the period covered by the report, and that any hope for an improvement, or for the concern even holding its own, is unfounded.

Who among New York's financial editors is competent to dissect the list of assets in the last report? Let us look at one list only, that of stocks of manufacturing companies. To handle it properly, we submit, requires expert knowledge of the electrical situation. The list is as follows:

MANUFACTURING COMPANIES.

Brush Electric Co. (pref.), Cleveland, Ohio....	$122,800.00
Brush Electric Co., (com.), Cleveland, Ohio...	1,995,200.00
Canadian General Electric Co., Ltd., Toronto, Can..................	1,250,000.00
Excelsior Electric Co., New York City..........	387,000.00
Fort Wayne (Ind.) Electric Co................	2,000,450.00
Ft. Wayne Trust Securities (Series A), Boston, Mass..................	9,776.00
Otis Electric Co., Yonkers, N. Y..............	174,000.00
Schuyler Electric Co., Middletown, Ct.........	50,000.00
Schuyler Elec. Mfg. Co. (com.), Hartford, Ct..	84,000.00
Schuyler Elec. Mfg. Co. (pref.), Hartford, Ct..	307,930.00
Short Electric Railway Co., Cleveland, Ohio..	2,000,000 00
Spanish-American Light and Power Co., Jersey City, N. J..................	4,000.00
Swan Lamp Mfg. Co., Cleveland, Ohio..........	33,000 00
Union Elecktricitats Gesselschaft, Berlin, Germany..................	50,026.00
United Electric Securities Co. (com.), Boston, Mass..................	500,000.00
United Electric Securities Co. (pref.), Boston, Mass..................	23,100.00
Total..................	$8,991,282.00

What daily paper has published anything assisting the public to make a correct estimate of these items?

1. There is a $500,000 mortgage on the Brush Works, covering everything the company owns of any value.

2. Excelsior stock can be bought for 5 per cent. of par value in this city.

3. The Schuyler Electric factory has been closed and dismantled. It is worth about $60,000 as against $443,000 of securities.

4. The Short Electric Railway Company never owned anything, not even a factory. It has been out of business for two years and owes the Brush Company (G. E. sub-company) $440,000.

5. Stock of the Swan Lamp Company, Cleveland, could not be sold there or here for five cents on the dollar.

Now, to go back to the Ft. Wayne Company. What daily paper writer could fathom the mysteries?

Last year the stock owned was given at $1,921,850 and carried at $1. This year it is $78,600 more, and carried at we know not what. It should not appear at all.

In the early 80's the Ft. Wayne Jenney Electric Light Company was organized. In 1889 all the stock, $500,000, was sold to the T.-H. people in Boston. Then the Ft. Wayne Electric Company was organized and capitalized at $4,000,000, *leasing* the factory of the former company for fifteen years, but the former company paying all merchandise bills, labor, etc., and billing the product to the latter, of which the T.-H. people had control until last year. In 1894 a receiver was appointed for the Ft. Wayne Electric Company. For every dollar of the G. E. claim of $1,137,000 against the receiver, there is a counter-claim for $1.50 by the receiver against the G.E. Company for various and sundry collateral, taken for loans in the five years and sold below value, and for other things. In 1894 the Ft. Wayne Electric Corporation was organized. They needed a factory. They therefore bought the factory of the Ft. Wayne Jenney Company, giving notes secured by bonds as collaterals which latter ($350,000) appear also as assets in this year's report. If the stock on the notes of the Ft. Wayne Electric Company held by the G. E. Company have any value, we would like Mr. Dow to give us an estimate of it.

Whose opinion is best on this whole subject—ELECTRICITY'S, the daily paper financial editors, or those who are parties to the swindle?

Now as to the value of patents. ELECTRICITY was and is entirely correct—$8,000,000 should be charged off. The value is gone.

If patents are worth anything, it is because they produce or are expected to produce in future a revenue to the owner. The value is proportionate to the revenue. In most cases, in order to be of any value, they must control some business or some feature of that business.

The G. E. Company's patents produce no revenue. No other manufacturer pays them any royalty. No light or railway company would pay $1 for the exclusive right to use their system in any territory. They control nothing. Not one article of manufacture in the whole range of electrical supplies but is made and sold by a dozen other companies.

At one time Edison patent rights were salable. They are not now salable. Edison did original work and had something to sell.

The Thomson-Houston patent rights were never worth the paper on which they were written. The company never produced original work. Their patents always were valueless. They always copied the work of others. They originated no system, no feature of any system.

The value of the Edison patents has passed away forever.

Patents have at full limit seventeen years of life. From the time they begin to produce full revenue they decrease in value each year. In all conservative bookkeeping they are so charged off each year. This has not been the policy of the G. E. Company.

They have, with almost unbelievable impudence, from the first year of the organization, depended upon the mysteries of a patent account to hide a deficit which existed the first day of their life, and which has been continually growing up to the date of this issue.

When permission was asked to list G. E. stock at the Stock Exchange in 1892, reports were filed of the condition of the companies forming General Electric. In that report patent values were given as follows:

Thomson-Houston..................	$338,354.29
Edison..................	332,551.22
Capital stock Edison Light and Sprague Railway Companies, whose only assets were patents..................	4,506,099.25
T.-H. International..................	286,110.99
	$5,463,114.75

This was the only valuation of these patents heard of from June, 1892, until April, 1893. Meantime the stock was listed, insiders had sold large blocks to the ignorant public above par, and $10,000,000 of bonds had been floated.

When it came to making up the next annual report it was necessary, for purposes of stock speculation, to make a false showing. The patent item was the easiest one to manipulate, and it was marked up to $8,159,264,02, an increase of $2,696,149.27.

And it must be remembered that the first valuation in June, 1892, was outrageously inflated. The patents had been proved to be of slight value. The business could not be controlled by them and competition multiplied. The Edison licensee idea was worked out. It had been proved that local companies buying the rights of either company paid something for nothing.

No new patents of any consequence have been added to the list. The three patents which were relied on to control the art have been declared void by the courts or expired by limitation. There is not one patent left which would bring $5,000 at auction. There are 3,000 patents which would not bring $1 apiece.

Now, what was the object and nature of this vast increase in the patent account in the first eight months of the break, and how much of the stock represented by this vast sum reached the pockets of the directors and other insiders engaged in the operation of bringing these three companies together? How much of the stock issued for this vast sum has been disposed of and used to line the pockets and swell the bank accounts of these persons?

Our point from the very first discovery of this transaction has been, and still is, that there never has been any reason for the transaction and valuation except *fraud*, and that the sum of $8,000,000 carried as an asset is not represented by anything upon which one-sixteenth part of that sum could be realized under the most favorable circumstances. Further, the patents controlled by the company have always been, and still are, a source of actual weakness and constant loss to the corporation by reason of the too reckless mismanagement of its patent matters, of which we shall in the near future have much to say.

Stated briefly, our position on this asset of patents is:

1st. There never was any just reason for placing the patents as an asset on the books on any other base than that given in the report to the Board of Managers of the New York Stock Exchange and embodied in the prospectus issued to the public upon which the insiders sold stock and $10,000,000 of bonds were floated.

2d. Any such increase in this patent account as that shown in the first annual report was legally and morally a fraud.

3d. Even the amount named as the value of the patents in the report to the Stock Exchange should have been reduced year by year rather than increased, unless indeed other and more controlling patents than those expired or declared invalid had been since acquired. This we know has not been the case.

Why have not our esteemed contemporaries of the daily press handled this subject correctly? Because they are ignorant of the special conditions of the electrical trade.

Of what value to the public, therefore, are their comments?

We trust we have made ourselves clear.

We cannot speak for other trade papers. As far as ELECTRICITY goes, however, we can assure our constituents and our contemporaries that they can learn through our columns the exact condition of the G. E. Company and of any other electrical company which tries to float securities upon the public market.

We are ready to answer in the courts for any thing printed here, and to prove the correctness of our views, however radical. We never speak without knowledge.

The curse and the disgrace of the entire business have been the misleading of the public, the robbery of innocent investors. From $500,000,000 to $600,000,000 of manufactured product has been sold at good prices. Less than $10,000,000 has been returned as dividends to stockholders.

Does the outside world wonder that the honest element in the trade, for which ELECTRICITY is the spokesman, smarts under the continued conditions of dishonor and disgrace which the trade is forced to endure, forced upon it by coteries of speculators whose only aim is individual gain by any methods, honest or dishonest?

* * *

Where Does the Waste of Coal Occur? We have probably published more matter in relation to central station economy than all of our electrical contemporaries combined. Some of this has been original, a good deal of it has been from papers read before the various engineering societies, and still more probably has been culled from the columns of the engineering press and properly credited. We believe that the question of central station economy is the most important one now confronting the electrical industry, and take pleasure in reprinting this week a long editorial on this subject from the *Engineering Record*, which, coming from one of the most authoritative journals on steam as well as other branches of engineering, is entitled to more than usual attention.

In order that we may supply our own deficiencies, it is necessary, first, that we know that they exist in the plant as a whole—this is now pretty well understood among central station men; and, second, that we should know in what *parts* of the plant they exist, and to what extent they are remediable. This is not so well known among central station men, and the editorial in question is peculiarly valuable for the reason that it emphasizes some sources of loss in central station practice to which adequate attention has not heretofore been called.

There has been some discussion as to just where the maximum losses usually occur, some arguing that that place is in the boiler house, while others maintain that the engine and steam connections must bear the brunt of it; and it is doubtless true that each is right when the question is viewed from his own standpoint and each wrong when it is viewed from the standpoint of his opponent.

The editorial of our contemporary is a continuation of a discussion that it has been called into by a paper read by Mr. Perry at the Cleveland Convention, in which the author claimed that the storage of energy was essential to central station economy and Mr. Perry's figures, whether correct or incorrect, did show that material economies could be effected by the employment of thermal storage, whereby the boilers could be maintained in continuous operation throughout the variable load at their most economical rate. Our contemporary maintained that the thermal storage could only produce a saving in the boilers, whereas those losses were in fact far less than those "due to the variable load on the engine and dynamo, and the various wastes of steam which accompany these conditions of operating a power plant."

Now it seems to us that whether the effect of variable load is greatest on the boilers or on the rest of the plant will depend very much, if not entirely, upon how that plant is operated. Our contemporary says that "Every electric light or power station is provided with a steam plant which contains a number of engines and a number of boilers. To make the plant flexible and adapt it to the variable load a multiplicity of units seem a necessity." Now if each of these units were subject to the effects of variable load throughout the period of work—ten hours or twenty-four hours, as would be the case in most industrial establishments where separate departments were operated by separate units—there would seem to be no question that the aggregate losses of all the engines and dynamos due to this variable load would exceed the aggregate losses in the boiler plant due to the same cause. But in central station practice this is never the case. The boilers alone maintain a continuous loss due to variable load, and even when banked or shut down continue those same losses. The engines and dynamos, however, are all but one of them working at very nearly their best rate—the load on them is *not* variable except in the case referred to and in that case the unit is purposely made small. The loss in this small unit may be large in proportion to its rated capacity, but it will still be very small in proportion to the total output of the station.

To take a concrete example: we may have in a certain station four units of 500, 200, 200 and 100 H.P. each. We will say that the load line is such that after awhile the load rises too high for the 500 H. P. unit to take care of it—the 100 H. P. unit is thrown in. The first unit is now and henceforth working at its best rate. The variable load of the station no longer affects it. Supposing for two hours the 100 H. P. unit averaged such a poor load that its efficiency was but 50 per cent—the loss would be 50 per cent. of 100 H. P., and not 50 per cent. of 500 + 100 H. P.; it would be but about 8 per cent. of the total output. For a while the 100 H. P. unit will work at its maximum rate and then as the load rises and it becomes necessary to have more power a 200 unit is substituted for the 100. This new unit will never work at less than 60 per cent. of its rated best load, and will gradually rise from an efficiency of say 75 per cent to 85 per cent., averaging perhaps 80 per cent. The 20 per cent. loss is not 20 per cent. of 500 + 200, but simply of the last unit thrown in. Of the total it amounts to less than 3 per cent. Then the 100 H.P. unit is thrown in again with whatever losses involved in the variable load, but the 500 and 200 units are now working at their best load, and so the load line is met as it rises and falls by the throwing in and out of the necessary units. The losses are not therefore cumulative as with the boiler plant and as they would be with an ordinary industrial plant such as that supposed.

Our contemporary well states that in an electrical plant "there are boilers enough under fire and steam to supply the plant when called upon for its maximum output." When the 500 unit is thrown in there are 1,000 H. P. of boilers under fire and throughout the twenty-four hours continue those wastes in firing to which it calls attention. Even when a boiler is banked it is found to consume as high as 20 per cent. or more of the fuel required to keep it in full steam. Balancing this against the losses in an engine or dynamo, when it is not in use, which are practically *nil* from a fuel standpoint, we feel unconvinced that the losses at the boilers *in a lighting station* are not the greatest of those incurred. But we are obliged to the *Engineering Record* for pointing out so clearly how the losses do occur and how many of them can be lessened, and commend the article most fully to the perusal of our subscribers.

* * *

"Electricity" Heads the Procession. It is the function of a trade journal not only to present all the news of its trade up to the hour of going to press, but to so treat the news editorially as to make sure of the proper understanding of that news by every reader of intelligence.

ELECTRICITY has led the race in *presenting* the news so often and in such conspicuous instances that it is hardly necessary to again draw attention to this feature of the paper. We have never been caught a week behind with the announcement of any important matter, and have almost invariably been from one to four weeks ahead of all contemporaries.

What we now wish to impress upon the trade is that in the second feature of a great journal ELECTRICITY leads the procession just as surely. We interpret the news correctly, and we never copy fake news from the daily press except as fake news and with proper comment.

Recent instances are many. ELECTRICITY was the *only* electrical journal to publish the G. E. annual report in full. It was the only one to present such analysis of it as to render it intelligible to the layman. Previously, and a full week ahead of all competitors save one, we gave an abstract showing the vital points. As an interpreter the *Electrical World* has the most grievous sin to answer for in its editorial comment upon this report, giving currency to the falsehood that 3¾ per cent. was earned on the capital stock. The others followed closely upon the *World's* heels in assisting the G. E. wreckers to prolong their war of extermination by the dissemination of flat untruths.

Two weeks ago a fishy story came from Cleveland and Buffalo that G. E. officials were looking in those cities for new factory sites. Our contemporaries made no effort to find out whether this news had any basis for truth or not. They copied it and helped to deceive their readers. It was untrue. ELECTRICITY explained the matter fully.

The same week the Buffalo *Express* printed from their special New York correspondent a cock-and-bull story about Tesla's discovery of a method of transmission which was to be adopted at Niagara. The high-class technical talent on the editorial staffs of the *Electrical Engineer* and *Electrical World* took this seriously, copied it without comment, and again helped to deceive their readers. This was little less than a crime. Popular ignorance is dense enough now without being fostered by the so-called leaders in the weekly literature of the art.

ELECTRICITY, although neither the oldest nor the most supremely and dryly mathematical paper in the field, is old enough to know what's what, and never has been compromised in this way. When that Tesla-salt-solution-in-a-tube story came out in the *Express* we wrote to that paper as follows:

[COPY.]

Editor the Buffalo Express, Buffalo, N. Y.:

DEAR SIR: The *Express* has treated the Niagara matter in the main so intelligently that we are somewhat surprised at the stuff you have published in your issue of the 21st in regard to transmission of electricity in a salt solution in an insulated tube. The matter seems to have been furnished to you by your special New York man, and if you will kindly recommend him to call on some technical man, he might save you future humiliation. The suggestion is simply idiotic, and we are more than surprised to find it in the Buffalo *Express*. Yours very truly,

ELECTRICITY.

We never gave the subject any space in our columns.

Last week the most important matter on either side of the water was the reading of the paper by Mr. Ewing, F. R. S., on a new magnetic tester for hysteresis—published in full with illustrations in ELECTRICITY, and not mentioned by any of our contemporaries.

Clearly, in the points which make success and command it, ELECTRICITY heads the procession.

Under the Searchlight.

Views and Opinions on Timely Topics.

WHO WILL EXPLAIN?

(From the Evening Advertiser.)

"ELECTRICITY" AND GENERAL ELECTRIC.

We must confess to a sneaking fondness for Mr. B. E. Greene, the able editor of ELECTRICITY. We think he is a crank in some respects, but he has a way of stating his opinions with an engaging frankness and clearness that leave but little to be desired. In the issue of ELECTRICITY published this week no less than five large pages are devoted to a consideration of the General Electric report, in addition to a number of amusing and pointed paragraphs in the editorial department. The whole thing is quite worth reading, for two or three reasons.

Mr. Greene, as readers of the journal are probably aware, is not a believer in either the General Electric Company or the General Electric management. In fact, this is putting it very mildly. Still, after allowing for all prejudices and eccentricities, there are certain things in Mr. Greene's article on the General Electric report that seem to call for answer of some kind from the General Electric people. As long as Mr. Greene confines himself and his experts to an analysis of General Electric's figures, as published in the official report, the General Electric management can say with propriety that they do not feel called upon to interfere in any way or to take official cognizance of Mr. Greene's wanderings among the figures. Every man is entitled to his opinion, but when Mr. Greene says that "in this report an attempt is made to mislead with such outrageous impudence that it is at least worthy of special mention," and then proceeds to charge the management with having marked up a number of stock and bond holdings, which were carried at a nominal valuation a year ago, we respectfully submit that it is quite time for somebody on the General Electric side to say something.

It is nonsense for the management of a company like the General Electric to affect to be above criticism from any responsible person. It is utter nonsense to say that ELECTRICITY is not a responsible paper, for it is quite as responsible as many other trade papers. A specific charge s made by ELECTRICITY and an answer to this charge would seem to be in order.

Another serious accusation is made against the General Electric management, which is as follows: "We charge that this account (income) has been intentionally manipulated. The actual facts are that the total (sales) are a trifle over $9,000,000 for the year. The bookkeepers have done the rest." Inasmuch as more stress has always been laid upon the company's earning power when the matter was referred to in this column than upon any other portion of the company's accounts, we feel a little interest in the answer of General Electric directors to this statement. It is plain enough, and amounts to an accusation that the company has "cooked" its returns of gross sales. We ought to mention, while on this subject, that there is a libel action pending against Mr. Greene, and that the present would be a good time for bringing the suit to trial, in view of these remarkable statements.

It is unnecessary to detail the result of the analysis of the General Electric report in the columns of ELECTRICITY. As already said, every man is entitled to his opinion. In order, however, to impress upon the management of General Electric the necessity for taking some notice of the things that are being said, we make one further quotation from Mr. Greene's article which is particularly commended to the immediate attention of directors:

"It is, therefore, not hard to forecast the ultimate end of this swindling enterprise. The insiders will continue to manipulate the Wall Street annex to the business. They will make millions upon millions already made. Every available asset will be sold to pay currant expenses. Then the credit of the company will be forced to the full limit."

We must not be understood to associate ourselves with Mr. Greene's opinions quoted above. But we should like to know particularly whether or not the company's income account has been grossly overstated, as has been charged. That is of more vital importance than anything else at the moment, because, as we said some time ago, the value of General Electric stock consists solely in the earning capacity of the company. Mr. Greene's charge deserves an answer from somebody.

It is understood that Mr. H. McKay Twombly and Mr. D. O. Mills will resign from the General Electric board next week or in the near future. We don't see that their doing so makes any difference in the management. Everybody knows they have not had very much to do with it. What about those directors who have been chiefly responsible for the actual management of the company? Are any of them going to resign? Or explain? Or do anything?

The present would be an excellent time for the trial of a libel suit from our standpoint. But how about the G. E. Company?

Their career has been one of fraud and swindling from the beginning. Their charter itself was procured by bribery. ELECTRICITY is ready to name the amount of money paid for this charter, the men who paid it, the date on which the money was paid, the men who received it, and the place where it was paid.

If there is anything we specially desire it is the trial of a libel suit brought by the G. E. Company. But history shows that few of us get just what we want.

* * *

OUR CHARGES VERIFIED.

"Electricity's" Advance News Is Always Correct.

(From ELECTRICITY, Jan. 2, 1895.)

Whatever may be said to the contrary, ELECTRICITY speaks with full information in asserting that the entanglements of the concern with such subsidiary companies as the bankrupt Northwest General Electric can never be unravelled except by the courts; that a thorough investigation will show that *contingent liabilities* of over $2,000,000 have never been referred to in the official reports, and that *some of them will become pressing liabilities* before April 10 next.

(From the G. E. Annual Report, May 2, 1895.)

THERE EXIST ALSO SEVERAL UNSETTLED CONTRACTS ANTEDATING THE FORMATION OF YOUR COMPANY, BUT WHICH YOUR COMPANY HAS TO RECOGNIZE, AND WHICH WILL COST, PERHAPS, $500,000 TO SETTLE.

This half-million acknowledged is only the beginning. Next year it may be nearer correct.

* * *

IN the G. E. report mention is made by Mr. Ord of the accounts of 466 debtors, $2,291,844.48 now carried at $466. It is the evident intention to have the stockholders believe that this result was due to the ordinary misfortunes of business. This is not true. A large part of this amount is owned by bankrupt central station properties, which were either created or taken over by Mr. Coffin, in line with his general financiering scheme. They were bonded to their inevitable ruin, the bonds sold, and the public mulcted. They had to have a line of credit with the parent company while they were being "financed." They were as worthless then as now. Any stockholder can verify this charge. There are, moreover, several stations which are still obtaining undeserved credits for the same reasons. They are practically owned by the G. E. Company or the financiering companies, and must be carried.

* * *

One of the Gems.

The Fort Clark (Ill.) Electric Road has been sold by the master in chancery for $275,000, the purchasers being the bondholders, Charles E. Cotting, Edwin Packard, Charles S. Tuckerman, Samuel Spencer and Frank G. Webster, of New York. The road never paid any interest on its bonds. It was capitalized for $250,000 bonds and $250,000 stock, the G. E. Company holding $177,750 of the latter. The Street Railway and Illuminating Properties also had $50,000 stock.

* * *

IF robbers break into the sick room of an invalid, the first duty of the man's friends is not to give him medicine, but to drive off the robbers, killing them if need be. This is exactly what ELECTRICITY held to be its duty in regard to the G. E. robbers who tried to appropriate everything belonging to an established industry. When we have driven off the robbers we will prescribe for the trade, which is certainly in need of medicine. We would be glad to hear from any of our critics who hold that our attack has been too violent just what methods would have been more effective than those we adopted. Our columns are open for any opinion on this subject.

* * *

THE Harrison lamp works last year sold about 7,000,000 lamps. The average price was 15 cents above those now ruling. The total loss of net revenue in this branch of the G. E. Company's business will therefore be for the current year at least $1,000,000. Stockholders who wish to forecast the condition of the property next year will bear this in mind.

* * *

WHATEVER else may be said of Senator Quay, it is certain that he plays a strong game at politics. His chief desire just now is to have more of the Philadelphia corporations investigated, and the committee has been appointed at Harrisburg. Mr. Quay's object is said to be the punishment of some of his political enemies. Whatever the object, the result will be beneficial and wholesome, and the man from Beaver may be relied on to see that the job is thoroughly done. The local lighting trust is to be the first combination looked into. We trust Brother DeCamp is not afraid.

* * *

IF the Legislature of this State does its duty, it will pass the bill which Mayor Schieren has asked for, giving an appropriation of $30,000 for an investigation of various franchise matters in the city of Brooklyn. ELECTRICITY can furnish such a committee with valuable information, and we should do it without any regard whatever for those who might be exposed as bribers and parties to bribery. It is time that the special agent and his line of operations were removed from this trade. The G. E. Company, in procuring its charter, showed its appreciation of the value of money spent at Albany in influencing legislation, but we doubt if it would have the hardihood now to use any money to prevent the appointment of the Brooklyn investigating committee. If it makes the attempt, so much the worse for it. ELECTRICITY is not asleep.

THE UTILIZATION OF ELECTRICAL ENERGY FOR COOKING AND HEATING PURPOSES.*

BY R. E. B. CROMPTON,
President of the Institution of Electrical Engineers.

Up to the present time the utilization of electrical energy laid on now so universally in our houses for lighting purposes, for the further purposes of heating and cooking, has been regarded by the public, and even by many who have technical knowledge, as impracticable and certainly as too costly to be seriously adopted.

It will be my object this evening to show you that far from this being the case heating and cooking by electricity have now advanced to a highly practical and useful stage.

No doubt these erroneous impressions have arisen chiefly from the fact that the advocates of electric lighting have from the first dinned into the ears of the public that one of the chief advantages of electric lighting is that bright light is furnished without heat; even those who put it more precisely showed that a 10 C. P. gas jet heated the air of a living room thirteen times more than a 10 C. P. electric glow lamp, and it was the knowledge of these facts that prevented electrical engineers from carefully examining the problems connected with electric heating.

However, at very early periods Siemens showed that where intense heat is required to be concentrated in a small space the electric arc forms a very convenient furnace and in many cases actually possesses economical advantages. His principle was practically adopted by Cowles for his earlier furnaces for reducing aluminum, and has been also used for electrical welding by the Benardos process.

But for the production of the heat we require for warming rooms or for cooking food, little or nothing was done until about four years ago, for although Lane Fox was the first to point out in his 1878 patent that electrical heating could be satisfactorily carried out by placing the food or other materials to be heated in a vessel surrounded by a coil of insulated wire, through which a current should be passed, nothing appears to have been attempted until about four years ago. Carpenter in America so far developed Lane Fox's idea as to take out a patent for manufacturing electrical heating apparatus by attaching these resistance wires to the surfaces of cast iron plates by an enameling process, and a considerable amount of apparatus was manufactured by him in America on this principle. Some of this was forwarded to England and was shown at work by Messrs. Crompton & Co. at the Crystal Palace Exhibition in 1891.

In practice it was then found that although Carpenter had done sufficient to show that electric heating could be usefully employed, yet that the apparatus at that time was not sufficiently durable to be of practical value.

A number of serious defects made themselves evident, principally connected with the enameling process; the enamel was found to crack and the surface of the wire used was thus exposed to the oxidizing action of the air. This action rapidly destroyed the wire and thus broke the circuit.

It occurred to us that this difficulty might be surmounted if sufficient time were spent on a research into the nature of the metals best suited to stand the frequent heatings and coolings to which the apparatus is subject, and which at the same time would have a coefficient of linear expansion so nearly the same as that of the enamels used, and of the plates to which the wire is attached by these enamels.

After a long course of experiments we found that several of the nickel-steel alloys, varying in composition from nearly pure nickel to others containing quite a large proportion of steel, were well suited for the purpose, and in all respects were far superior to the german silver alloys which had been used in America. We also found that if we substituted for the homogeneous enamel used by Carpenter a composite enamel consisting of two or more layers, the lower one being of the hardest and most refractory character, we were able to obtain very satisfactory results. We have been able to use an enamel consisting almost entirely of silica for the groundwork; this fuses only at an exceedingly high temperature almost approaching the welding point of wrought iron. We devised special machinery to artificially roughen the surface of the plates to which this first coat of enamel is to be applied, and we thus insure that the layer of enamel between the wire and the plate to which it is attached is never even softened at the temperature reached by our apparatus in ordinary working.

We apply our nickel-steel wire in the form of a waved or crimped ribbon; this crimping is carried out by a special machine devised for the purpose.

This crimped ribbon is mounted on the surface of a "transfer plate," afterwards to be described, and it is from it transferred to the surface of the first coat of enamel which has been already raised to a temperature sufficient to soften it but not to melt it. We then cover the first enamel and the wire with powdered enamel of a more easily fusible nature, and we then raise the temperature of the whole to a sufficient degree to enable the second enamel to melt down and incorporate itself with the upper surface of the first coat of enamel, at the same time completely covering and insulating our wires.

This process is one which has required much study and considerable manual dexterity on the part of the workmen, but once it was perfected it gave excellent results; it allows the wire to be heated to any degree desirable for ordinary heating or cooking operations, without any fear of the enamel cracking so as to allow of access of air to the wire.

Not the least part of our difficulties was the preparation of the crimped wire and the designing of the transfer plates above referred to. We found that if we attempted to crimp the wire or arrange it in wavy patterns by hand, the wire was always liable to become thinner at each of the bends, and consequently the electrical resistance at these points was higher and the heat developed greater than that of the points intermediate between the bends. To avoid this we had to devise a crimping machine which crimped or corrugated the wire in such a manner as to avoid altering its cross sections; this machine takes the wire from a reel, crimps it and delivers it in any desired pattern on to the surface of the transfer plates.

The transfer plates consist of a metal plate to the back of which are attached a number of electro-magnets in such a manner that when the crimped steel wire has been laid on its plate in any desired pattern or form, by exciting the electro-magnets they hold the wire and retain it firmly in position on the surface of the plate until it is desired to transfer it to the heated surface of the enamel; this can be done instantaneously by breaking the exciting circuit so that the wire no longer adheres to the transfer plate.

We have other methods of rapid transfer but it is unnecessary to take up your time by describing them here, as the above method is fairly representative of the others.

By the above described methods we are able to apply the wire in somewhat complicated patterns to the surface of any metal plate and to insulate it therefrom in a very thorough and permanent manner by our compound enamel.

The only other difficulties which have arisen in connection with the enamel have been those due to unequal expansion and contraction of the terminals at the ends of the wire. At first we had some difficulty in arranging these so that the enamel did not crack and allow the terminals to be burnt or oxidized at the point at which the wire leaves the enamel.

The simplest form of apparatus, in which we heat a plate by a current passing through a wire enameled to its surface, is that which we call a heater; it is a cylindrical plate mounted on short legs, to the underside of which wire is applied and fixed by the enamel, the upper side being ground flat and polished. Such a heater can be put to many useful purposes; it can be used as a radiator of heat or as a means of heating dishes on the breakfast table or for the purpose of drying linen or for warming or drying any article which it is inconvenient or dangerous to place near the fire. It can also be used for cooking purposes if the food is placed on flat dishes or pans, care being taken that the lower surface of the pan comes into close contact with the upper surface of the heater; but although cooking *can* be carried out in this manner, we do not recomend the use of separate heaters as there is always a loss from the lower surfaces of the pans not making sufficiently good contact with the upper surface of the heater, and we therefore prefer to insure this contact by making the heating plate form part of the kettle, saucepan, frying-pan or other similar culinary utensil.

In the course of our experiments to determine the best and most efficient arrangements of our apparatus we met with great difficulties in what would appear a comparatively simple matter—the measuring of the temperatures we obtained. We found that the ordinary mercurial thermometer however carefully it may be made is not suitable for accurately indicating the temperature of the heated surfaces as it really indicates the temperature of a stratum of air near to the heated surface instead of that of the surface itself. After trying Callender's improved form of the Siemens electric pyrometer, we eventually adopted for our measurements of temperature my own form of platinum thermometer, a description of which may interest you at this stage. This platinum thermometer, which measures temperature by showing the increase in resistance due to the rise in temperature of a delicate coil or platinum spiral placed in close contact with the heated surface, is made and used as follows:

The spiral consists of a thin strip of platinum only two-thousandths of an inch thick by one twenty-fifth of an inch wide. A sufficient length of this strip to have about five ohms resistance at the temperature 0° C. is wound in a form of double spiral on to a strip of mica sheet about half an inch wide by four inches long; this is enclosed and held between two similar sheets of mica fastened together at their edges by a sewing of very fine platinum wire. The total thickness of the spiral and its covering is not greatly in excess of that of a sheet of paper, so that the whole of the spiral can be brought within a distance of one-hundreth of an inch from the surface to be measured.

It is arranged on an electrical circuit in series with a standard resistance made of manganin. The standard made of this alloy has practically no change in resistance due to change of temperature, i. e., within the limits of air temperature change of an ordinary room or laboratory. Both platinum spiral and the standard manganin resistance are provided with couplings or terminal screws, by which any desired number of platinum spirals may be coupled in series with the manganin standard. A very small constant current from an accumulator cell is passed through the whole of them. Each of the platinum spirals as well as the manganin standard is provided with a pair of potential terminals, and at the time of first calibration they are carefully adjusted so that the P. D. measured on a potentiometer is exactly equal when the platinum spirals are plunged in melting ice and the manganine resistance is at the ordinary laboratory temperature. It is convenient to balance them at this point at 1,000 on the potentiometer scale; the platinum spirals are then exposed to the temperature of boiling water in a hypsometer and if the platinum employed be pure the P. D. of the platinum spirals when now compared with that of the standard will be as 1362 : 1000. If this portion of the potentiometer scale between 1000 and 1362 be divided into 100 parts each of these will be equal to 1° C. It is evident that any desired number of temperature readings may be taken by employing a corresponding number of platinum spirals and comparing them in turn with a standard.

---

*Lecture delivered before the Society of Arts, London, Eng., on Wednesday evening, April 24th, 1895.

It is obvious that this method of taking temperatures presents many advantages over the employment of ordinary thermometers, as when these have to be used for taking temperatures of ovens, or of the interior parts of meat, or of other food, the act of removing the thermometers to take the reading introduces errors of considerable magnitude, whereas with the arrangement I have just described it is possible to take accurate readings, practically simultaneously, of the temperature in various parts of the oven or other apparatus and of various parts of a joint of meat, and in this way a great many interesting facts respecting cookery have come to light.

(*To be continued.*)

WASTE OF COAL.*

In a recent issue, when commenting on Mr. Nelson W. Perry's paper read at the Cleveland meeting of the National Electric Light Association, we advanced the opinion that the thermal storage system of boiler plants is not likely to secure the economy which its advocates expect, or to materially reduce the cost for fuel below what can be realized by careful work on the lines of existing practice. The reports of the performance of ordinary electric light and power steam plants reveal an absence of fuel economy which is remarkable when compared with the records obtained from steam plants connected with most other industries. Electrical engineers attribute this state of things quite properly to the variable character of the load. Some seem to think that thermal storage which tends to overcome the variable nature of the work in respect to the boilers has a good chance of securing needed benefits. In this they are partly in the right, but largely in the wrong. We believe that much of the waste of coal attributed to variable loads is only an incidental accompaniment of these conditions, and not by any means a necessary consequence. It requires little insight into the practical handling of boilers and engines in electric central stations to understand the real causes which make the coal records so unfavorable. As a supplement to the editorial referred to, this matter ought to be taken up, and the real status of the subject explained, a thing which we now propose to do.

Every electric light or power station, whether large or small, is provided with a steam plant which contains a number of engines and a number of boilers. To make the plant flexible and adapt it to the variable load a multiplicity of units seem a necessity. The steam plant, or a portion of it, is in operation as a rule night and day during the whole twenty-four hours, and two or more gangs of attendants are employed to care for it. There are boilers enough under fire and steam to supply the plant when called upon for its maximum output, and a sufficient number of engines are kept warmed and ready for duty to meet the ordinary requirements of the service and any unforeseen emergency caused by change of weather or extra demand. One of the rules of electric light operation is that the power must be "on tap," as it were, whenever it may be called for, and every attendant is imbued with the importance of this idea. Under these circumstances how does the man who shovels the coal and handles the dampers of the boilers, or the man who starts and stops the engines and controls the valves of the station, perform his duties? If these men follow the natural bent of workmen in their positions, the result will be this: A greater number of boilers are maintained with live fires than are needed for the moment, and those not required for immediate use are thrown out of active service by opening the firedoors and closing the ashpit doors, leaving dampers open, and coal on the grates in the active condition of burning. Dependence is here placed on the cooling produced by the inrush of cold air to the furnaces and deadening of the effect of the fires, to prevent too great generation of steam. This practice certainly checks the generation of steam, but it does not stop the consumption of coal. That goes on, though at a reduced rate, the resulting heat being carried off with the air to the chimney. In the same line, the boilers which have banked fires are left with draft on and doors wide open, thereby causing a more rapid combustion of the bed of coal in the bank than would otherwise occur, and, what is worse, cooling down the boiler and its contents through the introduction of the cold air. The loss of heat thus caused must be made good by burning new coal when the boiler is again set to work. There is no need of thermal storage tanks to prevent the waste caused by these practices. Proper oversight of the firemen and the right sort of instruction on these points is sufficient.

The engineman has a different class of duties. His great object is to have the engines ready in time and keep them in reliable operation. One important foe he has to fight is water in the steam. He must keep the pipes well drained, run the engine long enough when first starting without load to insure free pipes and free cylinder; and there is no guide save judgment to show him when this condition is realized. The result is that engines are run a longer time underloaded than the legitimate light load of the station represents, and generally longer than needed for the purpose in view. During the preliminary running drips of steam pipes and cylinders are, as a further precaution, kept wide open, which adds much to the wastefulness of the practice. Furthermore, when the engine is out of use the drips are left open to a greater or less extent so as to keep the pipes drained, and too often the drains of the engine pipes, and of the main system of piping of the boilers as well, are without adequate trap protection. The matter of how the drips are handled is one which is often lost sight of in many kinds of steam plants beside the electric, but it is important everywhere and it provides an avenue of waste which is frequently serious. In the electric plant it is peculiarly liable to be important, owing to the exigencies of the service. The loss from careless handling of drips bears a much larger proportion to the legitimate output when the load is small, as much of the time occurs in electric work, and for this reason waste in electric plants is liable to be extravagant where the matter is neglected. It should not be understood from these statements that the thorough drainage of water from the pipes and cylinders is uncalled for. It is in reality one of the most important matters in the care of engines. With the unthinking engineman, however, it may be abused, and it is the abuse of the practice which is the cause of much of the waste in electric stations.

Still another reason exists for the wastefulness of steam plants in electric work. The demands of the service sometimes require a multiplicity of engines. When this is the case the engineers in charge of such plants should keep close watch to prevent the waste of steam through leakage of valves and pistons of the engines, and through disordered stop valves and drip valves in the piping.

With these facts in mind it is far from remarkable that the consumption of coal reported by electric plants appears so excessive. If the steam plant in an electric station, or for that matter in any class of industry, is wasteful, let the work of the individuals who handle the shovel, the assistants in the engine-room, and of the mechanic who makes repairs be critically scrutinized, and the cause of large coal bills will not long remain unknown.

UNDERWRITERS' RULES.*

BY WILLIAM A. ANTHONY.

DISCUSSION—(*Concluded.*)

Mr. James I. Ayer—It is very gratifying to me, having worked with the Electric Light Association in relation to these rules for some years, to see the interest taken by the Institute in this matter. I think that if any additional arguments were needed I can cite a case which perhaps touches the engineer a little more directly and forcibly than some of the points made to-night; that is, the tendency of the inspection department of the Board of Fire Underwriters to usurp the prerogatives of the electrical engineer, in other words, to issue certificates to contractors which pass as current coin as evidence that they have got what they paid for—a first-class electrical installation. There is not an engineer here engaged in practical work who has not run against it, who has not seen passed what should not have been passed, and the investors, the men who are paying for the installations, would have been very glad to pay the engineer's fees if they did not feel they were getting something for nothing from the Board of Underwriters. A case of that kind came up only a few months ago where a very large installation was being made. The specifications were made partly by the manufacturing company and by the architect who had a little assistance in getting them out. But after the contract was awarded, while there were unusual electrical problems involved in the construction work, the parties paying for the installation declined the services of an engineer because they thought they did not need one. They had a competent contractor and realized that it was all right. Later on, when the installation was about to be completed, some comments were made by engineers who observed the work and said it was bad and all that. The question was raised in the Board of Directors—it was a very large corporation—as to whether it was right or not. Some thought it was; they advocated the acceptance of the contract as tendered by the contractor, but the point was raised that there was a lack of thorough workmanship. Immediately the contractor brought in the argument that the insurance certificate that he possessed was an evidence of what they had got; that they had everything that they could demand or desire under the contract. The work was accepted. A month later they paid a considerable fee to an engineer to tell them what the matter was—why they could not successfully operate the plant. It took about $20,000 to correct the evil, and they paid an engineer to tell them how little value an insurance inspector's certificate is. It is not often they come out that way—that the engineer profits in the end by it. But it is a fact that the Fire Underwriters are stepping into the shoes of the electrical engineer; they are interfering with his profession, his business, and I know, as Mr. Hammer has well said here, some of the members are anxious to have papers read here that "get within five miles of the earth occasionally." We all know that this question of insurance rules was regarded by many as something beneath the dignity of the Institute. It has been so expressed; it has been so treated. But I think that as the thing has taken shape it is clear to all the members that it is essential that this Institute take some definite action.

---

* From "The Engineering Record."

* A paper presented at the 96th Meeting of the American Institute of Electrical Engineers, New York and Chicago, April 17, 1895.

Mr. C. J. H. Woodbury—I came here this evening as a guest and to listen, not expecting to take any part in debate. My former position for a number of years was in technical relation to underwriters of manufacturing property, and I had occasion to have an intimate knowledge of the policy of the insurance companies in regard to electric light and power installation, and as that is now with me something of the past, I can perhaps look at the subject from a disinterested standpoint. There were a great many electric lighting rules, so called, made by local bodies of underwriters, at times conflicting bodies. In 1893, shortly after the last issuance of the rules of the National Electric Light Association, there was formed in Chicago what was known as the Underwriters' International Electric Association, the name of which has since been modified by the change of International to National. Suffice it to say that they adopted a set of rules which were in most respects along the lines of those of the National Electric Light Association. There were, however, some points of difference, and these rules have had several amendments which have been prepared and promulgated from time to time. Two months ago I had occasion to make definite inquiries throughout this country in regard to these electric lighting rules. I found that whereas the rules of the Underwriters' National Electric Association are at the present time very generally adopted, yet there is a great difference in their promulgation and enforcement, and that is a difficulty which seemed to be an inevitable one in the early stages of the work, but will grow less and less pronounced as time goes on, because the insurance companies will have a better trained set of men. At the meeting of the National Electric Light Association I had some unofficial assurances which I was able to present to the committee, and they made a report which has been received with a great deal of favor in insurance corporations. At the present time the affairs of the National Electric Underwriters' Association on the subject of these rules are in exceedingly good and competent hands. The chairman of the Electrical Committee is a member of this Institute, an electrician of accomplishments and standing, and one who in addition to his technical education has had a very extended practical experience in electric lighting and in telephony and telegraphy. All of these parties perceived the necessity of certain amendments and also the necessity of a unification of the whole set of rules, because this question of the function of these rules is not one which can be sub divided and separated one part from another by any line of demarcation. It begins with the design and extends to the construction, the installation and the maintenance of all electrical apparatus of whatsoever kind or nature, whether it uses all these quantities of energy which can be converted into heat sufficient to cause a fire, or whether it pertains to the inherently harmless instruments from battery circuits but which may be and are in certain conditions a possible source of danger by reason of their exposure to the heavier currents used in lighting and in power. These questions are fully recognized and can be treated in only one way, and that is by a conference representing all of the various tributary interests. I am sure that the Underwriters are alive to it and that they aim toward that end, because I judge from their representations to me to the extent to which I represent one of these interests of electricity in this matter. I am looking forward to a conference which will occur in the immediate future representing—I do not care under what head—all of these various electrical interests and which will result in the unification of the electric lighting rules, and it is through that means and through that means alone that such a result can be obtained. It should be conceded that it will take time for the training and development and selection of persons competent to enforce these rules adequately and justly.

The Chairman—The importance of this subject seems to demand that it be referred to a committee. We have a letter here received from one of our members who is ill. The secretary will please read it.

The Secretary—This letter is from Mr. Fremont Wilson, a gentleman who I think has been referred to this evening. I will read an extract referring to the subject:

"If Prof. Anthony's paper is discussed, I hope it will be deemed of enough importance to have a committee of five appointed and a resolution passed, and a letter sent to the New York Board of Fire Underwriters requesting that the privilege of an audience be given our committee by the New York Board in relation to the non-observance of standard rules, etc., and to prove to the representatives of the New York Board the injury they are doing to the electric light and power interests throughout the country by the peculiar methods that have been in vogue for the last two or three years."

Mr. Hammer—I would like to suggest, as has been stated here to-night, that the matter is already in the hands of the National Electric Light Association and that their committee will extend an invitation to the Institute of Electrical Engineers as well as representatives of the other interests, and that the matter will then be taken up, not dealing with specific cases, but with the whole thing in a broad gauge way. While we may move a little bit more slowly in that way, I think perhaps by joint action, going about it thoroughly, we will accomplish more than by having the Institute refer the matter to a committee in the way proposed.

Mr. Mailloux—I agree with Mr. Hammer that the matter ought to receive more deliberation before we act. At the same time I feel that there ought to be a committee representing the American Institute of Electrical Engineers on the subject. I also feel that further discussion ought to be had on the subject. I think that there are others, who would be present at another meeting perhaps, who would be able to contribute to the discussion. This subject is too important and it is of too much interest not only for the welfare of the society but for the individual welfare of its members to be passed over lightly. So far as the appointment of a committee is concerned, I would be willing to leave that to the Council. I think the Council is competent to appoint such a committee and to give it proper constitution, but I think the whole matter might be well laid over to the next meeting. I would make a motion to that effect. (Seconded.)

An Electric Weed Killer.

An electric weed killer for destroying the weeds and other vegetation along a railroad track—which are a source of considerable expense to railroad companies—has recently been invented, and is described as consisting of an alternating generator mounted on a car and producing electricity at 2,000 volts pressure and stepped up to from 6,000 to 24,000 volts, depending on the kind and quality of the vegetation which it is wished to destroy.

The conductivity of vegetable bodies varies as the moisture within them varies; the greater the moisture the less resistance they offer to the current. The current, after being stepped up to the voltage noted, is conducted through a series of fine wires or brush to the top of the weeds or grass; the other side of the circuit is made through the wheels of the car, as a matter of course, to the ground; the current, therefore, will leap from the brush suspended over the weeds through the weeds to the ground, and thus complete the circuit; but in doing so the current traverses the entire length of the plant, including the roots, and ruptures the cellular tissues, thereby totally destroying it. This destruction seems to be equally distributed throughout the entire system, the root suffering perhaps more than the body of it from the fact that the roots generally contain more moisture. It is said that in many cases the current in passing through the plant heats it to such an extent that it cannot be held in the hand without discomfort.

A New Battery of Extraordinary Strength.

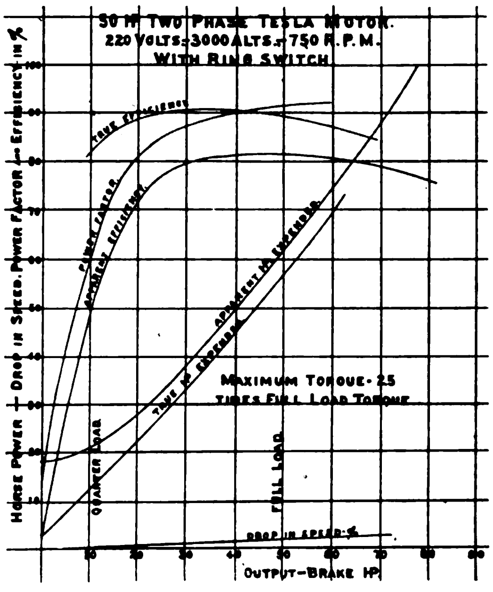
A new primary cell has recently been described, which consists of a plate of metallic magnesium in a solution of ammonium chloride, and a plate of copper in a solution of cupric chloride and hydrochloric acid. The electromotive force of this cell is given as three volts and its internal resistance is quite low. The current is said to be constant for long periods. If these reports be true, this is certainly the most powerful cell known.

THE PERFORMANCE OF THE TESLA MOTOR.

Supplementary to Mr. Perry's article on the new Westinghouse Electrical Works at East Pittsburg, which appeared in our issues for April 10th and 17th, we give the following curves of performance made especially for this purpose but completed too late for insertion with the rest of the matter. The motor under test was one of those referred to in the article rated at 50 H. P. It is running on the regular shop two-phase currents, 220 volts—3,000 alternations, 750 revolutions per minute. The switch for throwing in and out the starting resistances was of the ring or most recent type, and was illustrated in Fig. 4 on page 176.

The curves will sufficiently explain themselves, but it seems worth while to draw particular attention to several points in the performance of the motor.

The maximum starting torque of which the motor is capable is a little over 2½ times the full load running torque, but as in ordinary practice such a starting torque is not required, the starting resistance in the secondary of the motor is given such value that the torque at starting is about 1½ times the full load running torque. This is done to avoid the excessive current which is necessarily required by any motor, whether for direct or alternating currents, for the development of an abnormal torque. With such a resistance the current taken by the motor at the instant of starting is about 50 per cent. in excess of that taken at full load. When the motor has nearly attained full speed the starting resistance is short-circuited.



The motor when running unloaded takes only 18 apparent H. P., or 36 per cent. of the full load output.

The falling off of speed from no load to full load is less than 2 per cent.

The apparent and true efficiencies rise very rapidly as the load increases. At one quarter load the apparent efficiency is 57 per cent. and true efficiency 84 per cent. At full load the apparent efficiency is 81.5 per cent. and the true 89.5 per cent. The full load efficiency is better than is ordinarily attained by direct current machines of the same output, and the light load efficiencies are much better. Such a motor as this will have, therefore, a much higher all-day efficiency than a direct current motor of the same output in places where the power required is variable. It is claimed for this type of motor that, in addition to its electrical superiority, the simplicity and durability of construction and the consequent freedom from breakdowns, its ability to carry severe overloads without any harm resulting, and the ease with which it can be controlled both as to speed and as to direction of rotation, make such a machine as this much superior to any direct current motor for all ordinary purposes for which an electric motor can be used.

Annual Meeting of G. E. Stockholders.

IMPORTANT CHANGE IN THE DIRECTORY!

Two of the Leading Directors Resign Without Giving Reasons.

D. O. Mills and H. McK. Twombly Leave the Sinking Ship.

(Special Dispatch to ELECTRICITY.)

SCHENECTADY, N. Y., May 14—3:30 P. M.—The stockholders of the General Electric Company held their annual meeting here to-day.

The number of shares voting was 10,000 more than last year, when 210,436 shares were represented.

Directors D. O. Mills and H. McK. Twombly resigned from the Board. George F. Gardner and Thomas Cummins, both of Boston, were elected to fill the vacancies. Mr. Cummins serves temporarily only, as the resignations came so suddenly that none of those present were fully prepared for the situation either as aspirants or voters.

Mr. Cummins, who represents the Edison Company, will, it is understood, be succeeded by another representative of that interest.

Messrs. Mills and Twombly's resignations were tendered arbitrarily, no reason being given, but the supposition is that they were dissatisfied with the management of the company's affairs, or took a gloomy view of the future of the concern.

Five stockholders only were present.

The new Board of Directors is as follows :

Gordon Abbott.
Oliver Ames, 2d.
C. A. Coffin.
T. Jefferson Coolidge, Jr.
C. H. Coster.
Thomas A. Edison.
Eugene Griffin.
F. S. Hastings.
Henry L. Higginson.
J. Pierpont Morgan.
Robert Treat Paine, 2d.
George F. Gardner.
Thomas J. Cummins.

The old officers hold over temporarily.

Closing of the Brush Works.

(From the Western Electrician.)

> We are pleased to learn from no less authority than S. M. Hamill that there is little prospect of the Brush Works shutting down. In response to an inquiry, the following dispatch was received from Mr. Hamill :
>
> > Answering your telegram, these rumors have been circulated against us for the last three or four years. If the Brush Works are going to shut down, I have not heard of it.

Rubbish. A little over a year ago an order was issued by authority of the G. E. Board, directing the closing of the Brush Works and the transfer of the business to Schenectady. This order was countermanded by telegraph, because of pressure exerted by Messrs. Coffin and Lawrence and some Cleveland banks where the G. E. Company had call loans.

We do not wonder that Mr. Hamill dislikes to accept our news as correct, because ——. But *it is correct.*

ANOTHER shortage in accounts is said to have been discovered in the Chicago office of the G. E. Company recently. We wonder when Mr. Sunny will wear out the patience of Mr. J. Pauline Ord?

To Enlarge Its Business.

The Standard Electric Company, Chicago, has increased its capital stock from $1,000,000 to $1,500,000 in order to provide increased facilities. It also elected A. G. Spalding president, relieving S. P. Parmly, who will remain in the directory. E. E. Crepin will continue treasurer and D. P. Perry general manager. The remaining members of the directory are Gilbert B. Shaw, J. P. Whitney, of Philadelphia, and G. A. Rollins, of Boston.

The stockholders are well pleased with the results of the past two years, notwithstanding adverse general conditions.

Are They Cramped For Room?

(From the Schenectady Union.)

> Bids are being received by the General Electric Company for the early erection of a new machine shop for use at the plant in this city. The new building will be of the same form as the one erected last summer by the managers of the Schenectady Locomotive Works. It will be of brick, two stories high, absolutely fire proof, of the dimensions of 360 x 80 feet. The estimated cost is $175,000.

Personal.

The engagement is announced of Dr. Frederick Bedell, of the physical department of Cornell University, to Miss Mary L. Crehore, of Cleveland.

Mr. George M. Russell, of the firm of Russell & Officer, Denver, has been in New York for several days.

Mr. James I. Ayer has lately returned from a brief visit to his home in St. Louis.

The Future of Coal Gas.

A recent editorial in the *Progressive Age* (the Welsbach journal) and our reply to the same in a recent issue render the following from the London *Electrical Review* pertinent at this time :

> We are greatly concerned about the future of coal gas, and with our well-known large-heartedness have been constrained to indicate certain directions in which the monopolists may exercise commercial activity when that time shall arrive, which they are aware is not far distant, when they will be re-echoing Othello's mournful plaint up and down the land. If they are wise the gas companies will then become what mankind have been defined to be, namely, "cooking animals"; and thankful should they be that total effacement should not be apportioned to them. Some time ago, when the danger of obliteration first began to threaten them, Dr. Siemens, we believe, was kind enough to suggest that they should make two grades of gas, one for lighting, the other for heating purposes. He proved a very Job's comforter, for these companies shrank from the expense of a second installation. So they, with fear and trembling, sat down and awaited events. Their patience is rewarded; their savior has arrived. Mr. Lewis T. Wright has recently claimed that as the lighting power of coal gas is increased its carbon density and hydrogen density are also increased, and, per cubic foot with that increase, a corresponding increment of heating power is obtained. In other words, make the gas give more light and it will give more heat, and there will be no necessity for having two separate installations. Don't they wish they could do it and still pay the big dividends! All the world knows, especially the miserable consumer, that in spite of every effort the light from coal gas does not always attain the low standard laid down by law.

To Cut Hair by Electricity.

To have your hair singed off by electricity is the latest development of the tonsorial art. The apparatus to perform this operation consists simply of a platinum wire stretched over a comb. By pressing a button in the handle of the comb current is applied to the wire, and it is heated to a white heat. The comb is passed through the hair, and as the wire comes in contact with the hair it is burned off, the end of each hair being cauterized as cut, which process prevents the loss of the oily substance with which the hair is filled. The apparatus is connected by flexible cord and attachment plug to a lamp socket, and can be used by any barber of ordinary skill.

The Bell Electric Company, 26 Church street, are manufacturers of the device.

General News.

What Is Going on in the Electrical World.

Mauch Chunk, Pa.—East Mauch Chunk is talking of putting in an electric-light plant.

Mechanicsburg, Pa.—Bids for electric street lighting in Mechanicsburg will be opened May 23.

Elmwood, O.—A bill providing for an electric light plant for this place is now before the council.

Albany, N. Y.—The Governor has signed the bill authorizing Green Island to establish an electric lighting system.

Portland, Ind.—The city has purchased of F. Bimel the waterworks and electric light plants, the price being $65,000.

Towanda, Pa.—The borough council has granted a franchise for an electric road to the Towanda Traction Company.

Darlington, Wis.—Dexter, McDonald & Co. have been granted a franchise to put in an electric lighting plant in this city.

Quincy, Mich.—A waterworks system has recently been put in here, and the people are now hankering after electric lights.

Bardstown, Ky.—This town has voted to purchase an electric light plant by an overwhelming majority—237 for, 9 against.

Athens, Mich.—The subject of placing electric lights in Athens is being discussed quite strongly by some of our enterprising citizens.

Frederick, Md.—The board of aldermen has voted to adopt an electric fire alarm system, probably that of the Gamewell Company of New York.

Westminster, Md.—At the recent municipal election the ticket favoring lighting the streets by electric arc lights was elected by a large majority.

Belleville, N. J.—The people here by vote have decided to abandon kerosene lamps for street lighting and put in an incandescent electric light system.

Nebraska City, Neb.—Mayor Bartling says he will substitute electricity for mule power on his street railway as soon as the new opera house is completed.

Boone, Iowa.—The people of the new part of this town are making a move to have the motive power of the present street car line changed from horses to electricity.

Thayer, Ark.—The Thayer *Tribune* and Mammoth Spring *Monitor* have succeeded in waking up the councilmen of this city to the necessity of electric lights.

Warren, O.—An electric railway from Warren to Jefferson is again being talked of. The route suggested is through Cortland, Mecca, Greene, Colebrook and New Lyme.

Milwaukee, Wis.—It is announced that the work of changing the motive power of the Milwaukee and Wauwatoso Motor Company to electricity will be begun at once.

Holland, Mich.—This city now owns an electric light plant, having purchased all the Wolverine Company's outfit except the boiler and engine. The price paid was $6,000.

Halifax, N. S.—It is understood that all the capital necessary to build and equip the Halifax electric street railway has been secured. The company will shortly be organized.

Natick, Mass.—The Natick Electric, Natick Gas and Eliot Falls Electric companies have been consolidated. The Eliot Falls Company will furnish motive power as well as electric lighting.

Boston, Mass.—The trolley mail service is now in full operation in this city and giving entire satisfaction. Postmaster Coveney is delighted with the workings of the new system.

Gretna, La.—Capt. Thomas Pickles, owner of the Algiers and Gretna Street Railroad, has applied to council for permission to change the motive power of his road from animal to electricity.

Staten Island, N. Y.—The trustees have granted a franchise to the Staten Island Electric Railway Company to construct and operate an electric road on several of the streets of the village of Edgewater.

Bucyrus, O.—The latest project in electric railroads here is a line from New Washington to Galion via Leesville and Knisely Springs. It is claimed that a stone company at Leesville is behind the deal.

Fort Wayne, Ind.—A company is being organized here, with Perry A. Randall at the head, for the purpose of building an electric railway from this city to Blue Lake, near Churubusco, a distance of 15½ miles.

St. Petersburg, Fla.—The Plant Investment Company has purchased the Pinellas Hotel property, about one and one-half miles out, and will build a fine hotel there and also an electric railway connecting with this place.

Springfield, O.—John J. Webb and W. H. Hanford have secured the right of way for an electric railroad from Urbana to Springfield, and are hopeful of getting the right of way into and through this city.

Cornish, Me.—An electric railroad from here to the New Hampshire line through the towns of Baldwin, Parsonfield, Hiram and Porter is the latest proposal to the railroad commissioners. Sufficient capital has been pledged.

Bangor, Me.—Work has begun on the new line of electric railway connecting Bangor, Orono and Oldtown. The first shovelfull of dirt was tossed by Hon. I. C. Libby, of Waterville, one of the prominent members of the company.

Toronto, Can.—The trouble between the Canadian General Electric Company and their employees at Peterboro has been settled.—Among the latest Canadian incorporations is the Ingersoll Electric Power and Light Company, capital $45,000.

Hoboken, N. J.—The Bonta Manufacturing Company have secured a location in Fourteenth street in this city. The company will engage in the manufacture of an electric brake invented by Supt. Bonta of the North Hudson County Railway Company.

Rushville, Ill.—C. W. Wainman has under consideration the construction of a freight and passenger electric railway between Rushville and Mt. Sterling. It will require, according to estimates, $75,000 to build and put the road in running order.

Chicago.—In less than three months the horse car will have utterly departed from the streets of Chicago. By June 1 all the North Side horse cars will probably be operated by electricity, and by the end of August most of the West Side lines will have discarded horses.

Independence, Mo.—The franchise and properties belonging to the Citizens' Electric Light Company of this city have been purchased by the Western Electric Light Company, who will improve the plant by putting in new dynamos. The purchase price was $25,000.

Eau Claire, Wis.—Judge Jenkins has appointed George B. Wheeler, of this city, receiver of the Eau Claire Street Railway, Light and Power Company. The receivership is the result of foreclosure of its mortgage of $400,000 by the Atlantic Trust Company of New York.

Topeka, Kan.—Postmaster A. J. Arnold, T. M. James, L. Stair and F. C. Downey, of Topeka, have organized a company to build and equip an electric railroad from North Topeka to Silver Lake and Rossville this summer. The capital stock of the company is to be $1,000,000.

Vicksburg, Miss.—The Mayor has received letters lately from a number of cities in regard to municipal lighting, in reply to a circular sent by him requesting information as to the cost and operation of plants installed. The sentiment here is in favor of the city having a plant of its own.

Knoxville, Tenn.—Bids will be received at the office of the Board of Public Works in this city until May 23 for lighting the streets of the city with 200 or more electric lights of 2,000 C. P. each for the term of one or five years. A bond of $10,000 will be required for faithful compliance with the contract.

Watkins, N. Y.—The Watkins and Havana Electric Railway Company have sent their incorporation papers to Albany to be filed. The company is composed of Watkins, Montour Falls and Elmira men, and the capital stock is $50,000. The road will extend from the Northern Central station in Watkins to Havana Glen.

St. Louis, Mo.—The St. Louis and Jefferson Barracks Railroad Company has filed its acceptance of the franchise granted by the county court some time ago to construct an electric railroad from the southern terminus of the Southern Railroad, in Carondelet, to Jefferson Barracks, and deposited $1,000 as a guarantee of good faith.

Richmond, Va.—The sub-committee on streets of the city council are still wrestling with the question of introducing electricity as the motive power for a railway in Broad street, this city. Several propositions have been submitted to them for overhead and underground systems, and it will probably take them a few weeks to decide the matter.

Troy, N. Y.—It is thought probable that the proposed railroad from Troy to Averill Park will be built. The road will be constructed so that either steam or electricity or both may be used as a motive power.—The State railroad commissioners have granted the application of the Troy City Railroad Company to change their motive power from horses to electricity.

Montpelier, Vt.—J. S. Viles has bought land along what is known as the Middlesex Narrows, and will dam the stream and build a plant to furnish electricity for lighting and power. He is confident that the fall is strong enough to furnish electricity for the lighting of Middlesex, Waterbury, Moretown, Waitsfield and Stowe if the towns care to try the new light.

Phelps, N. Y.—At a citizens' meeting held recently to consider the advisability of bonding the corporation for $35,000 to put in a water and electric light plant, the Board of Trustees, together with E. D. Mead, W. C. Edmonston and W. H. Edson, were appointed a committee to investigate the matter and report at a meeting to be called by the president of the board in the near future.—The trustees have issued a call for bids for a five years' contract for lighting the village by electric light.

Seneca Falls, N. Y.—The *Reveille* says: "The Geneva, Waterloo, Seneca Falls and Cayuga Lake Traction Company has issued a mortgage in the sum of $500,000 to the West End Trust and Safe Deposit Company, which has been filed in the county clerk's office at Ovid. The former company expect to issue stock of the road to the amount of $450,000 and to bond it for $500,000, making a grand total of $950,000. This does not include the park nor the electric plant at Geneva, which are to be stocked and bonded separately."

Reading, Pa.—The Citizens' Electric Light, Heat and Power Company has been organized in Reading and has applied for a charter of incorporation. The directors are: John R. Bechtel, Charles N. Frame, Milton H. Schnader, L. V. Halberstadt and Henry C. England. Mr. Bechtel is president, Mr. Frame secretary and Mr. England treasurer. The capital stock is $100,000. The objects of the new company are to manufacture, distribute and supply light, heat and power by means of electricity to the public in the city of Reading and suburbs.

Annapolis Md.—The route of the Baltimore, Severn Park and Annapolis Railroad has been located. The line begins at Brooklyn, Anne Arundel county, and will extend to Annapolis, its entire length being about twenty-three miles. At Brooklyn, the northern terminus of the line, connection will be made with the Baltimore Traction Company. The officers of the new company, which obtained its charter rights a year ago, are: President, G. Howard White; secretary, R. J. Dungan; treasurer, D. F. Simons; chief engineer, Lee Martin; attorney Arthur M. Easter; general manager, Robert B. Johnstone

Greensburg, Pa.—The *Press* states that "the Pittsburg, Greensburg and Latrobe Electric Railway Company will become a reality in a short time as a result of the Monongahela Traction Company being granted a charter at Harrisburg with a capitalization of $5,000. The charter members are Alan D. Woods, John F. Davitt, L. G. Woods, Richard Fickling and J. Harper Adams. The purpose of the company is to secure rights to govern the White Electric Traction Company, now operating two miles of track from McKeesport to Duquesne; the Homestead and Highland railway to the proposed bridge at Walnut street, McKeesport; and the McKeesport, Wilmerding and Duquesne line, operating between twelve and fifteen miles of road through McKeesport.

Pottsville, Pa.—The new power house of the Schuylkill Electric Railway Company at Palo Alto, Pa., will be 515 feet long, 85 feet wide and two stories high. It will be composed of iron and brick, the whole to be covered by a metallic tile roof, highly ornamented and surmounted by several towers. The structural iron will weigh over 7,000 tons, and a massive carriage is employed in hoisting the heavy girders, stringers and pillars into position. The building will be so arranged that its roof will cover everything necessary in the operation of a large trolley line. Engines, generators, boilers, machine shops, car house, paint shop, elevators and offices, all will be under the same roof and part of the mammoth structure.

Baltimore, Md.—Among the rapid transit facilities engaging the attention of some of our most enterprising citizens, the Boynton electric railroad system is attaining some prominence and a line on the bicycle plan is to be built at Windsor Hills, a suburban locality. The company which proposes to build the road was incorporated on the 1st inst. The name of the incorporation is the Gwynn's Falls Railway Company. The capital stock is $30,000, divided into 600 shares of $50 each. The total mileage of the company is not to exceed twelve miles.—The Maryland Electric Company will shortly erect a new electric light and power plant on West Pratt street in this city.—It is stated that the two 90-ton electric motors to be used by the Baltimore and Ohio Railroad Company on the Belt Line, will be here and ready for use before June 10. The motors are being built at the Schenectady Locomotive Works, Schenectady, N. Y.

Telephone and Telegraph.

The Cape May, N. J., city council has passed an ordinance granting the right to the South Jersey Telephone Company to establish a local telephone, and passed to third reading the ordinances giving franchises to the Cape May City Electric Light and Power Company and to the Postal Telegraph-Cable Company to operate in the city.

At a meeting of the stockholders of the Harrison International Telephone Company at Chicago on the 6th inst., the following directors were re-elected: Stephen B. Elkins, R. C. Kerens, George R. Peck; William Warner, C. M. Ferree, Dr. E. M. Harrison, H. M. Holden, Kansas City; H. J. Hanford and Patrick Egan, New York. Gen. Robert R. Porter, of New York, was succeeded in the directory by H. S. Smith, consulting engineer of the Illinois Steel Company. J. T. Blake, a capitalist of Kansas City, was added to the list. According to a statement of one of the stockholders, the company is now actively engaged in putting in plants in 81 cities.

The Central New York Telephone and Telegraph Company has made arrangements for improving its service between Utica and Syracuse by putting in a new copper metallic circuit. The company expects to extend its copper metallic circuit northward from Lowville to Watertown.

Among the ordinances introduced at a recent meeting of the city council at St. Louis was one granting for a period of fifty years to J. A. Schultz, Thomas J. Ward, August A. Busch, Charles F. Joy, M. Greenwood, Jr., E. W. Stamm, Joseph M. O'Shea, Andrew Haley and T. J. Hennessey the right to erect, maintain and operate an electric system in St. Louis, and to supply electricity for transmitting and carrying on the business of sounds or messages by telephone or other electrical or mechanical devices, by renting space from any underground companies where it can be had, and by poles and wires where it cannot. It is provided that the prices shall not exceed $60 per year for business houses and $48 for residences.

Representatives of the Harrison International Telephone Company have been visiting Hot Springs, Ark., with a view to the organization of a local exchange in that city.

A State Association of home telephone companies is in process of organization at Columbus, Ohio. The object of the association is to provide for the construction of toll lines from county seats to their county lines in order to connect the various cities of the State. One of the objective points is to reach Columbus. Under the new system it has been found impossible to make connections with the Bell telephone exchanges, and the plan is to have a system of their own. The plan discussed is to allow the city originating the business 85 per cent. of the tolls, and the city receiving the same 15 per cent. It is claimed that by this system the tolls would be made uniform.

The temporary telephone line established by the Mutual Automatic Telephone Co. at Chicago as a test proved highly successful, and everybody who used it pronounced the system superior to the Bell. Steps are being taken to capitalize a company to handle the system in Chicago. It will have a capital stock of $500,000.

The project of putting in a telephone exchange in Tomah, Wis., is being worked up by F. H. Johns, with pretty good prospects of success. In addition to a local service, it is the intention to secure connections with other towns by putting up a line to Sparta, through Tunnel City, and using the line already established to Warren and points beyond.

George Metheany is to be the manager of the new telephone company at Lima, Ohio. The new company is hustling in a manner which looks decidedly like business. They are planting poles all over town, and have undoubtedly come to stay.

A telephone exchange has been established at Verdi, Nev. There is talk also of lighting the streets with electricity.

The Louisiana Telephone Company of Louisiana, Mo., has been organized, with officers as follows: S. C. Hassler, president; Charles G. Ruffman, vice-president; Frank W. Buffum, secretary; F. M. Flegle, treasurer; M. J. Hassler, manager.

The Unity Telephone Company of Chicago, incorporated on the 1st inst., with a capital stock of $100,000, intend to introduce telephones into the small towns in the South and West. The incorporators are W. R. Crompton, John C. Adams and Thomas V. Strain, all having offices in the Unity Building, Chicago. The company controls the use of the Hunning transmitter.

The Northwestern Telephone Exchange Company has lately erected several new long-distance lines in Texas. They will shortly begin work on a line from Fargo, N. D., to Grand Forks, and other lines in North Dakota will be constructed during the summer.

Griffith Coit, secretary and general manager of the Central Standard Telephone Company, stated at St. Louis a few days ago that the work of organizing local companies throughout the territory covered by the parent concern will begin at once. The Central Standard is a branch of the original Standard Telephone Company of New York, and is capitalized for $5,000,000, covering the States of Missouri, Arkansas, Kansas and Nebraska.

At Harrisburg, Pa., on the 6th inst., three Pennsylvania telephone companies were chartered. They are the Anthracite Telephone and Supply Company, Shamokin, capital $10,000; the Mutual Benefit Telephone Company of Northeast, Erie County, capital, $1,000; the Columbia Telephone Company of Columbia, capital $5,000.

Dr. McWayne, of Poysippi, and John Boysen, of Tustin, Wis., have just put up a telephone line between Poysippi and Omro, and are contemplating the construction of a telephone line between Oshkosh and Tustin, via Butte des Morts, Winneconne and Bay Boom.

The Trades League of Philadelphia has addressed a letter to the Select and Common Councils, calling attention to the high rentals paid for telephones in the city departments, and suggesting that "the city advertise for bids for the furnishing of telephones by purchase for the city's use, that the contract be awarded to the lowest and best bidder, and that the city enter into no more contracts for the rental of telephones; also suggesting that in this connection there is nothing to hinder the city from manufacturing her own telephones."

Arrangements have been completed and contracts let by the Salina Telephone Company for putting up three telephone lines centering in Salina, Kan., and connecting with neighboring towns. One line will extend southeast and connect Salina with Kipp, Chico and Gypsum City. The second line will extend directly south through Mentor, Assaria and Bridgeport to Lindsborg, and the third will extend west to Bavaria and Brookville. It is the intention of the company to build a line to Topeka and Kansas City within the next year.

A proposition has been made to the city of Sedalia, Mo., by which it would become the northern terminus of a long-distance telephone line. J. H. Childers, of Hermitage, and A. S. Munsell, of Kansas City, Mo., propose to build a line from Springfield to Sedalia if the people of Sedalia will buy coupon tickets to the amount of $1,000.

At a meeting of stockholders at Kingston, N. Y., a few days ago, James W. Gardner was elected president of the West Shore Telephone Company vice Dr. Snow, and Dr. C. V. Sahles chosen as vice-president. A mortgage of the company's property will probably be made to raise funds to pay off its indebtedness and place it on a sound basis.

Muscatine, Iowa, has refused to grant a franchise to the Postal Telegraph Company to run its lines through the town. The reason given is that no monetary consideration was offered.

Efforts are being made at Girard, Kan., to establish a telephone exchange.

A local telephone company is being organized at Tecumseh, Neb.

F. E. Bell is trying to interest the citizens of Baraboo, Wis., in a telephone exchange, which he proposes to establish in that city through a stock company to be known as the Baraboo Telephone Exchange.

The Home Telephone Company has leased quarters for their telephone exchange in Chillicothe, O., and everything is now in shape for the construction company to put in the plant.

The Bell and Escott telephone systems at Big Rapids, Mich., have been consolidated.

J. W. Davis, W. A. Williams and others have secured a franchise for a new telephone exchange in Texarkana, Ark., after signatures for 75 'phones had been agreed upon by individuals and firms there. These parties are under obligation to stand to their agreement. The rates will be much lower than those of the old company.

W. G. Kendal and J. S. Bowman, of Weatherford, Tex., are in consultation with the business men of Mineral Wells in regard to putting in a telephone exchange.

George Burham, Jr., and others have presented a petition to the city council asking for the right to establish and maintain a system of telegraph or telephone in the city of Portland, Me.

It is said a deal has been consummated at Madison, Wis., by which a company in which the principals are Madison capitalists has secured exclusive control of the French Milne telephone patents in the United States. The system will be extended over the whole country as a competitor of the Bell.

The Electrical Construction and Supply Company of Wilmington, Del., was the lowest bidder for placing a telephone system in the Department of Justice in Washington.

The city council of Mitchell, S. D., has passed an ordinance granting a local telephone company an exclusive privilege to operate a telephone system in that city for five years.

A stock company has been formed at Neosho, Wis., to put in a telephone line from Neosho to Woodland and Iron Ridge.

The contract for building the exchange of the Northwestern Telephone Company at Oshkosh, Wis., has been awarded the Northwestern Telephone and Electric Company of Milwaukee.

Sycamore, Ill., has organized a local telephone company, and will rent telephones to private parties for $18 per year and to business men for $24.

A Grand Rapids, Mich., paper states that the Harrison Telephone Company has already secured over 1,200 subscribers at Grand Rapids, and efforts are being made to induce those who have already subscribed to lengthen their contract to three years. The local company expects to organize some time this month, when the location for an exchange will be selected.

J. W. Blakely, representing the Mississippi Valley Harrison Telephone Company, has asked the council of Pine Bluff, Ark., for a telephone franchise, with rates of $2.50 per month for business houses and $1.50 for residences. Subscribers are asked to sign a contract for five years providing the service rendered is satisfactory.

The People's Telephone Company at Knoxville, Tenn., has reduced its rentals for residence 'phones to $24 a year, and the company's new contract with subscribers binds it never to raise the present rate. In the meantime the East Tennessee Company is not charging anything for its services and cannot see the People's one better unless it begins to pay people to take the instruments.

The Mount Vernon Telephone and Messenger Company, recently incorporated, has elected the following directors: Horace Granfield, Franklin T. Davis, Charles H. Ostrander, S. H. Gray, John Dawson, John Berry and William Archer. The company has a capital of $40,000, and is allowed to operate anywhere in Westchester County, N. Y.; it has about 200 subscribers, and the work of constructing an exchange at Mt. Vernon and stringing wires will be commenced in a few days.

The American Telephone Construction Company has been granted a franchise to establish an exchange at Brookville, Ind. The company has completed an exchange at Newcastle.

The Unity Telephone Company of Chicago, has been incorporated by W. R. Crompton, John C. Adams and Thomas V. Strain. Capital stock, $100,000.

Carthage, Mo., is to be connected with Webb City and Joplin by a new telephone line. The plant will be put in by T. J. Clark and George Wheeler, of Carthage, and a war in rates is likely to result, as the Missouri and Kansas Telephone Company already has a line in operation there.

A franchise has been granted to Fred S. Haines and J. A. Melone for the construction of a telephone exchange in Rochester, Minn., the system to be inaugurated within six months. The company will place nearly 100 instruments. The exchange is to be operated by a patent device.

Frank H. Sweet and Waldo Sweet have applied to the council at Fond du Lac, Wis., for a franchise to establish in that city a new telephone exchange. They claim to have 200 subscribers among the present users of telephones and expect to get 300. Their rates are $2 a month for business houses and $1.25 for residences.

Articles of incorporation for the Fox River Valley Telephone Company have been drafted, and the capital stock placed at $10,000. Upon the granting of a franchise in Neenah, Wis., the articles will be filed with the Secretary of State. The incorporators are D. K. Gilles and O. L. Huie of Neenah, and Charles Churchill and J. W. Evans of Waupaca. It is the intention of the company to construct an exchange at Neenah and connect with the Badger Telephone Company's line which runs from Waupaca to Berlin.

COMMERCIAL PARAGRAPHS.

The Metropolitan Electric Company, 186-188 Fifth avenue, Chicago, has secured the exclusive agency for the United States for the Ayer Self-Locking Windlass. This windlass has several important improvements over other makes now on the market and commends itself on first sight to all practical stationmen.

The Elbridge Electrical Manufacturing Company, Elbridge, N. Y., is about to move into quarters better suited to its increased business.

The Metropolitan Electric Company, 186-188 Fifth avenue, Chicago, report a good demand for the Dayton Electric Ceiling Fan, for which they are the Chicago agents. They have already closed some nice orders this season.

Line Material at First Hands.

The Central Manufacturing Company of Chattanooga Tenn., one of the largest concerns manufacturing and dealing in lumber in the South, is turning out a line of cross arms, insulator pins and brackets suitable for line construction of all kinds.

The Eddy Electric and Manufacturing Company.

(From the New Britain Herald.)

The Eddy Electric Works at Windsor, Conn., is experiencing a brisk revival of business. Large orders from all over the country are coming in every day and the company find it necessary to work overtime.

Additions to the force are being made and wages have been increased 10 per cent.

Telephone Apparatus of Danbury Electrical Works.

Of the complete line of telephones manufactured by the Danbury Electrical Works, Danbury, Conn., two instruments are shown in the accompanying engravings. In Fig. 1 is shown a type of disk set combining both receiver and transmitter in one piece. This instrument possesses an advantage that will commend it to busy office men. The receiver and transmitter are so arranged that the operations of sending and receiving messages can be carried on without change in position of the operator's head, leaving him free use of his hands while engaged in a telephone conversation.

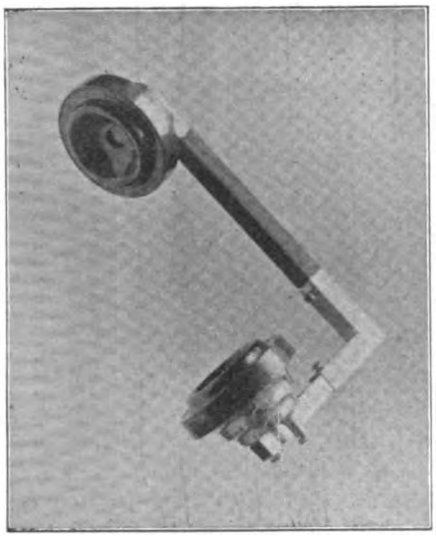


FIG. 1—DESK TELEPHONE.

In Fig. 2 is shown the "Russell, No. 40," or local and long-distance instrument. The granular carbon transmitter is of a special pattern embodying all those essential features and improvements requisite in a powerful transmitter adapted to long-distance work.

This company manufactures other types of instruments designed for local exchange, private line and interior service. All parts are well made and handsomely finished. The cabinet work is neatly designed and highly polished. In all types of telephones manufactured by this company silver diaphragms are used, insuring perfect contact. In addition to the above-described instruments, this company manufactures a very complete line of telephone parts and accessories.

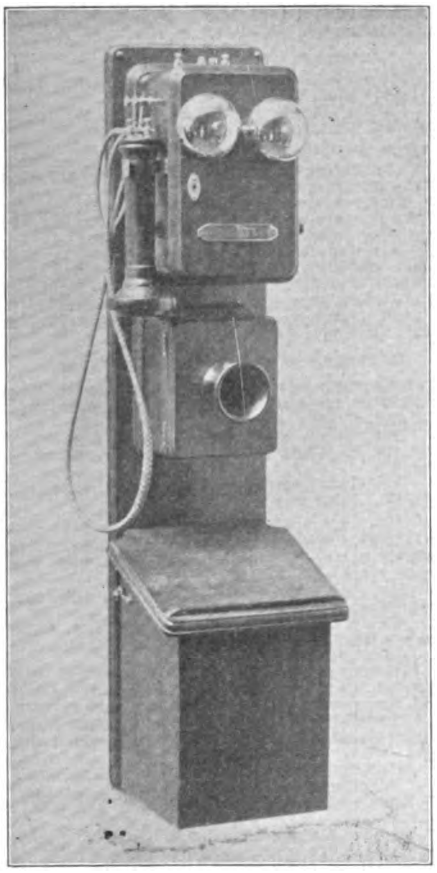

FIG. 2—LONG DISTANCE TELEPHONE.

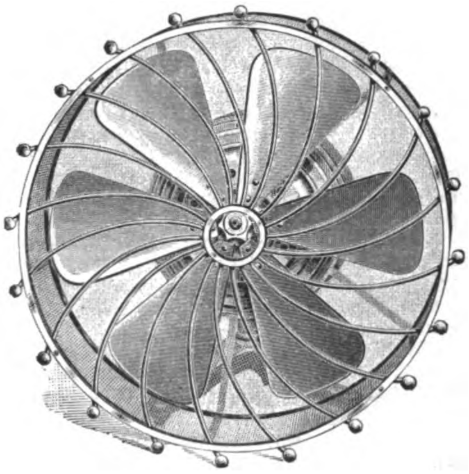
The New York office of the company is at 143 Liberty street, Mr. E. E. Smith being in charge. A number of contracts have already been closed, and the prospects for a large and profitable trade are very flattering.

Wagner Fan Motors.

The Fan Motors manufactured by the Wagner Electric Manufacturing Company, St. Louis, embody all the improvements which five years of manufacture and service have suggested. These motors are wound for both direct and alternating currents. They are guaranteed perfect in workmanship and design, and to run, with proper care, for three months without repairs of any kind. Each motor has self-feeding carbon brushes which will run a season without renewing, and self oiling bearings which hold an ample supply of oil for several months' run.



FAN MOTOR WITH GUARD.

All motors are finished in black enamel with gilt trimmings and polished brass fan and end caps. These caps entirely enclose the ends of the motor, protecting armature, commutator and bearings from dust and dirt. The weight of the motor and spread of the legs make it very stable, rendering fastening unnecessary, while the rubber feet effectually prevent all noise and vibration. Speed regulators are attached to both alternating and direct-current motors.

The above cut shows a front view of fan and motor with close-meshed fan guard.

The Vance Electric Company.

The Vance Electric Company, with offices at 136 Liberty street, New York, has been incorporated, with A. S. Vance president and J. H. Cheever secretary and treasurer. Mr. Vance is also general manager of the company. His experience in electrical work extends over a period of eleven years. First, three years with Leonard & Izard Company of Chicago, then two years in central station work. In 1889 he became assistant general manager of the United Edison Manufacturing Company until it was merged in the Edison General Electric Company. He then became assistant general manager of the lighting and power department of that company, holding the position until September, 1891. From September, 1891, until September, 1894, he was general superintendent for H. Ward Leonard & Company, and had entire charge of all the construction departments of that company.

The new company will devote its attention to general electrical construction work in buildings and central station lighting, particularly to the lighting of private residences and the installation of decorative work. In this line some new features for interior decoration and appliances for lighting private grounds by means of automatic disappearing lamps will be brought out. The company will also give special attention to isolated and telephone plants for private buildings as well as central station work.

Some of the most recent work completed under Mr. Vance's supervision is the signal plant of the Metropolitan Traction Company on Columbus avenue, New York; complete plant for lighting the Canton Court House; H. L. Terril's house and grounds, Rumson Road, Red Bank, N. J.; J. L. McBirney's residence, No. 41 West 36th street, New York; six private residences on West 74th street, New York; Zabriskie Memorial Church, Newport, R. I.; residence of Lispenard Stewart, 6 Fifth avenue, New York, and residence of Mrs. Anson Phelps Stokes, Lenox, Mass.

The Western Telephone Construction Company.

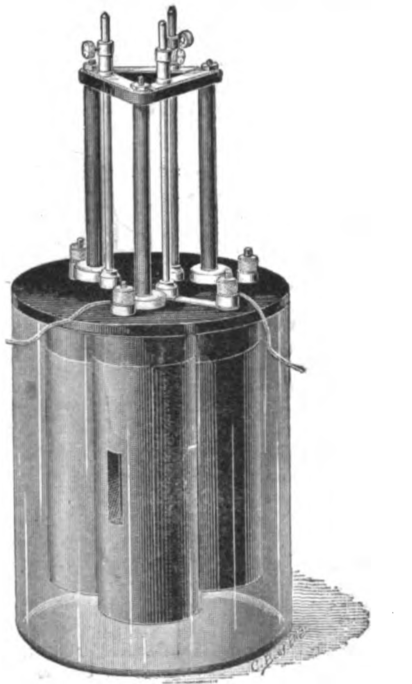
The Western Telephone Construction Company, Chicago, has moved into new manufacturing quarters having a productive capacity of ten times their old one. The company has been having more orders than it could fill, but with increased facilities will soon catch up on delayed shipments.

The company is now producing more telephones daily than the Bell Company ever produced in its best days. The new switchboard of this company is acknowledged to be the most perfect board yet manufactured, and is now being turned out in quantities sufficient to meet the large and increasing demand for exchange equipment.

The Boynton Multivolt Battery.

In the Boynton Multivolt Battery, E. S. Boynton, the inventor, believes he has achieved results heretofore unattainable in battery work. In a 6 x 8 jar with a singl solution and an ingenious arrangement of carbons, the whole of which is denominated a cell, he has produced a battery capable of supplying a current of five amperes at five volts. The carbons are of cylindrical form, carefully made from special mixture. They are arranged with their axes equidistant from each other. To attain the maximum output of the battery the cells are connected in series. As a consequence the resistance of the cell becomes higher than that of the circuit to which the battery is attached, and the voltage is increased in proportion t the number of the cells.

Perforations in the sides of the carbons permit a circulation of the battery solution, which, by contact with th surface of the jar, prevents the rise in temperature exceeding 3 or 4 degrees above that of the surrounding air.



BOYNTON MULTIVOLT BATTERY.

The Multivolt Battery of the Grenet type, the inventor claims, will deliver approximately 25 watts of energy for 13½ consecutive hours. The consumption of zinc is small, and to renew the battery any good commercial battery fluids and amalgamated zincs can be used at a cost not exceeding 16 cents.

The battery is made in plunge pattern and in any and all of the well known types. It is adapted to any purpose to which primary batteries can be applied. It is well made and handsomely mounted.

The battery is manufactured by the Boynton Multivolt Battery Company, 10, 12 and 14 Whipple street, Brooklyn, N. Y.

The Adams-Bagnall Electric Company.

Brief mention was made by us a few weeks ago of the resignation of five of the leading men in the Brush Electric Company. These gentlemen have now formed a new company at Cleveland and will soon be ready for actual business. A brief mention of the members of the firm shows that it starts off well equipped for a successful career.

Mr. Thomas E. Adams had been with the Brush Electric Company for a number of years, during which time he had made some important and valuable inventions in arc lamps, one of them, the Brush-Adams lamp, bearing his name, appears prominently in the new company's list

Mr. E. J. Bagnall was for eight years with the Brush Electric Company, but more recently has been in St. Louis, where he gained a reputation as a consulting engineer.

The business interests of the company will be looked after by its manager, Mr. L. H. Rogers, whose reputation was earned as assistant general manager of the Brush Electric Company and manager of the Sperry Electric Railway Company.

Mr. C. W. Phillips had been connected with the Brush Electric Company almost from its beginning, representing it in this country, Europe and Japan, where he spent several years.

Mr. S. E. Cox, formerly with the Swan Incandescent Lamp Company, will have charge of the incandescent department.

Mr. George Arnold had also been connected with the Brush Electric Company for many years and held various positions of responsibility. His last connection with said company was at the head of the drafting department, in which position he had shown a decided aptitude in the line of dynamic engineering.

Associated with the above-named men are some o

Cleveland's active business men, who will look after its financial affairs and see that it has ample capital to carry on its business so as to secure the best results.

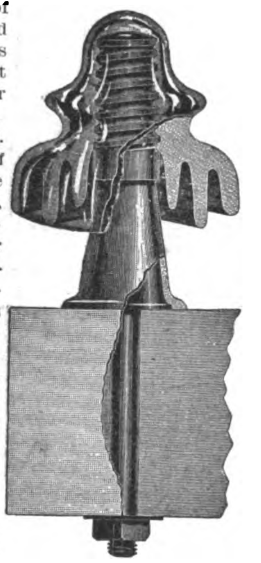
Regarding the output of the company nothing definite can be officially stated at this time, but it is known that they will make arc lamps, incandescent lamps, and possibly railway motors.

The officers of the company are as follows: Charles G. Hickox, president; George W. Howe, vice-president and treasurer; L. H. Rogers, manager; S. E. Cox, secretary; C. W. Phillips, superintendent. They have leased the factory at 47 East Prospect street. The company is organized under the laws of the State of Ohio with a capital stock of $150,000.

Mr. S. T. Dodd, formerly instructor at Princeton College, subsequently with the Brush Electric Company in the dynamic engineering department, and now of the New Jersey Traction Company, has been secured as consulting electrical engineer.

Indestructible Line Material.

The weak points in line construction have heretofore been in the insulator pins, break arms, etc. A wooden pin, however strong when new, soon becomes decayed and under the severe strain of a heavy or tautly stretched wire often breaks and throws the light or power station out of service until the ground or short circuit is repaired.



Fred M. Locke, of Victor, N. Y., is manufacturing a line of indestructible material, the use of which, it is asserted, renders line troubles impossible. His Steel Insulator Pin, illustrated in the accompanying cut, is easily attached and its use strengthens the cross-arm, avoiding as it does all tendency to split the arm. These pins are now used by railway, lighting, telephone and telegraph companies throughout the United States and have everywhere given the utmost satisfaction.

In addition to this specialty Mr. Locke manufactures insulator pins, break arms, side brackets, ridge irons, triple petticoat glass and porcelain insulators for high potential circuits, cross arms, braces and all kinds of line material, suitable for electric light, railway, power, telegraph or telephone purposes.

INCORPORATIONS.

The City Park Railway Company, Portland, Ore.—to build and operate electric railways, electric light plants, own property, etc., in Oregon, Washington, etc. Capital stock, $25,000. Promoters: S. Z. Mitchell, C. N. Huggins, J. A. Cranston, Portland, Ore.

The Cleveland and Painesville Railway Company, Cleveland, Ohio—to construct and operate an electric street railroad between Cleveland and Painesville, Ohio. Capital stock, $200,000. Promoters: John J. Shipherd, M. H. Solloway, Nelson Moses, J. S. Casement, C. O. Child.

The Proctor Heating Company, Chicago, Ill.—to prosecute the general business of plumbing, gas fitting, sewerage, electrical, steam and hot water heating in all branches. Capital stock, $10,000. Promoters: Thos. H. Fitzgerald, Alfred D. Proctor, Hart J. Fitzgerald.

The Metropolitan Electric Street Railway Company, Chicago—to construct, maintain, operate and equip street railways in the counties of Cook, Du Page, Kane, Lake and Will, Ill.—to be operated by electric, cable or horse motive power. Capital stock, $5,000,000. Incorporators: Robert P. Parker, Richard E. Breed and James F. Dagley.

The Edenwald Street Railway Company—to construct and operate an electric street surface railway within and outside of the corporate limits of the village of Wakefield in the towns of East Chester and West Chester, N. Y.—Capital stock, $50,000. Directors: Jefferson M. Levy, of New York City; John M. Digney, of White Plains; Matthew Clune, of Peekskill; Herbert D. Leat, of Mount Vernon; Theodore H. Silkman, of Yonkers; George J. Penfield, of Wakefield; G. Waite Tubbs, of New York City; John Duffy, of White Plains, and David H. Hunt, of Williamsbridge.

The Freeport General Electric Company, Freeport, Ill.—to construct, own and operate an electric street railroad in Freeport, furnish and sell electricity for power, heating and lighting purposes, manufacture and sell all kinds of electrical appliances. Capital stock, $125,000. Pr moters: Wm. O. Johnson, Newton P. R. Hatch, Chas. H. Hatch.

The Multifuse Switch Company, Chicago, Ill.—to manufacture, buy, sell and deal in electrical and mechanical devices and instruments of all kinds, and also do a general manufacturing business. Capital stock, $100,000. Promoters: Howard M. Carter, Chas. B. Carter, Edwin C. Lancaster.

The Chapin-Douglas Electric Company, New York, N. Y.—to manufacture and deal in electrical and mechanical apparatus and supplies. Capital stock, $10,000. Promoters: Chas. E. Chapin, Greenwich, Conn.; J. S. Douglas, F. W Douglas, New York, N. Y.

The Chicago Subway Arcade and Traction Company, Chicago, Ill.—to construct, own, maintain and operate a system of subways and dummy railways; maintain and furnish necessary system of power, light, heat, ventilation, pavements, conduits and other constructions. Capital stock, $15,000,000. Promoters: Chas. F. Griffin, Marvin E. Barnhart, Jno. K. Nelson.

The Phœnix Construction Company, Crawfordsville, Ind.—to construct and operate telephone exchanges, steam and electric railways, etc. Capital stock, $100,000. Promoters: Noah J. Clodfelder, Crawfordsville, Ind.; Jacob Frank, Isidore Grohs, John W. Paris, of Indianapolis, Ind.

The Warwick Street Railway Company, Philadelphia, Pa.—to build an electric street railway in Delaware County, Pa. Capital stock, $50,000. Promoters: Harry P. Collins, J. Mortimer West Jr., Henry Delaplaine, Philadelphia, Pa.

The Edgewood and Sulphur Springs Passenger Railway Company, Williamsport, Pa.—to operate an electric passenger railway. Capital stock, $10,000. Promoters: W.E. Ritter, G. L. Crouse, Jno. L. Kelly, Williamsport.

The New England Turbine and Fuel Company, Portland, Maine—to generate, apply and use motive power of all kinds. Capital stock, $1,000,000. Promoters: Isaac W. Derby, Boston, Mass.; Dexter B. Wentworth, Chas. H. Crane, East Somerville, Mass.

The Lawrence Water Company, Portland, Maine—to manufacture gas and electricity and machinery and fixtures for gas works, water works and electric light works. Capital stock, $200,000. Promoters: Wm. C. Eaton, Edw. D. Noyes, Geo. F. Noyes, Portland.

The Abilene Water Company, Portland, Maine—to manufacture gas and electricity and machinery and fixtures for gas works, water works and electric light plants. Capital stock, $125,000. Promoters: Wm. C. Eaton, Edw. D. Noyes, Geo. F. Noyes, Portland.

The Shelbyville Water and Light Company, Portland, Maine—to manufacture gas and electricity and machinery and fixtures for gas works, water works and electric light plants. Capital stock, $225,000. Promoters: Wm. C. Eaton, Edw. D. Noyes, Geo. F. Noyes, Portland.

The Paola Water Company, Portland, Maine—to manufacture gas and electricity and machinery and fixtures for gas works, water works and electric light plants. Capital stock, $150,000. Promoters: Wm. C. Eaton, Edw. D. Noyes, Geo. F. Noyes, Portland.

The Crawfordsville Water and Light Company, Portland, Maine—to manufacture gas and electricity and machinery and fixtures for gas works, water works and electric light plants. Capital stock, $300,000. Promoters: Wm. C. Eaton, Edw. D. Noyes, Geo. F. Noyes, Portland.

The Three Cities Electric Company, Colorado Springs, Col.—to acquire, manufacture, own, let, lease, sell and supply electric light, heat and power. Capital stock, $100,000. Promoters: A. A. McCovney, A. L. Lauton, E. J. Eaton, of Colorado Springs.

The San Mateo Electric Light Company, San Mateo, Cal.—to maintain and operate the business of manufacturing ligh, heat and power by means of electricity, gas, steam, etc.; construct plants for same. Capital stock, $25,000. Promoters: F. M. Greenwood, E. A. Greenwood, San Francisco, Cal.; Phil. M. Roedel, Alfred B. Ford, C. E. Knapp, of San Mateo, Cal.

The Perry Water, Light and Ice Company (incorporated in Indiana), Perry, Oklahoma. Capital stock, $150,000. Promoters: Wm. E. Caldwell, Benj. J. C. Howe, Indianapolis, Ind.; Edw. S. Gaylord, E. D. Nims.

The Nunda Electric Light Company, Nunda, Ill.—to furnish electric light and power to the residents of Nunda and Crystal Lake. Capital stock, $5,000. Promoters: E. C. McCollum, H. H. McCollum, E. E. McCollum.

The Western Light Company, Kansas City, Mo.—to do a general electrical and gas business. Capital stock, $3,000. Promoters; Chas. A. Gray, Lessia A. Hull, Edw. F. Littleton, John W. Hull, Kansas City, Mo.

The Bonta Manufacturing Company, Hoboken, N. J.—to manufacture all kinds of machines and equipments for electrical plants and railways. Capital stock, $150,000. Incorporators: Arthur K. Bonta, Wilber C. Anderson and Alexander Young, all of Hoboken.

The Savannah Telephone Company, of Savannah, Mo. Capital stock, $10,000. Incorporators: B. E. Egan, John Donald, L. N. Hooper, Jr., J. M. Hughes and J. A. McLean.

The Western Illinois Telephone Company, Augusta, Ill.—to operate telephone lines. Capital stock, $5,000. Incorporators: P. P. Newcomb, Moses Weinberg and Jacob W. Klepper.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MAY 7, 1895

ELECTRIC RAILROADS AND APPLIANCES.

538,649. Closed Conduit Electric Railway. George E. Baird, Chicago, assignor of one-half to William D. Henkee and Andrew Reiner, Blue Island, Ill. Filed April 30, 1894.

538,650. Closed-Conduit Electric Railway. George E. Baird, Chicago, assignor of one-half to William D. Henkee and Andrew Reiner, Blue Island, Ill. Filed June 11, 1894.

538,786. Electric Railway. Henry R. MacLean and Gustav A. Kornetzke, Schenectady, N. Y. Filed Aug. 3, 1894.

538,838. Supply System for Electric Railways. William Lawrence, New York, N. Y., assignor to the Lawrence Electric Company, same place. Filed April 28, 1894.

538,844. Trolley Bar. Clarence Parker and Arthur R. Trepagnier, New Orleans, La. Filed July 13, 1894.

538,904. Electrical Connection. James M. Faulkner, Philadelphia, Pa. Filed Feb. 28, 1895.

ELECTRIC LIGHTS AND APPLIANCES.

538,999. Electric-Arc Lamp. Samuel S. Allin, London, England. Filed Oct. 29, 1894.

539,019. Electric-Lighting System. Rufus N. Chamberlain, New York, N. Y. Filed Oct. 22, 1894.

DYNAMO ELECTRIC MACHINERY.

538,648. Alternating-Current Motor. Engelbert Arnold, Zurich, Switzerland. Filed July 10, 1894.

538,669. Safety Device for Electric Motors. Rudolf Eickemeyer, Yonkers, assignor to the Otis Brothers & Company, New York, N. Y. Filed July 13, 1892.

538,757. Dynamo-Electric Machine. Addison G. Waterhouse, Pittsburg, Pa., assignor, by mesne assignments, to the Westinghouse Electric and Manufacturing Company, same place. Filed Feb. 4, 1889.

538,825. Commutator. Jonathan P. B. Fiske, Alliance, Ohio. Filed Feb. 9, 1895.

TELEPHONE AND TELEGRAPH APPARATUS.

538,651. Telegraph-Key. Charles W. Bradford, Clinton, assignor of one-half to E. W. Boyer, Fairfield, Me. Filed Jan. 24, 1894. Renewed Feb 21, 1895.

538,816. Telegraphic Sounder. Jesse H. Bunnell, New York, N. Y. Filed April 19, 1893. Renewed June 21, 1894.

538,975. Telephone System. James W. McDonough, Chicago, Ill. Filed May 21, 1891.

MISCELLANEOUS.

538,670. Electric Transfer-Switch. Axel Ekstrom, Lynn, assignor to the General Electric Company, Boston, Mass. Filed Sept. 7, 1893.

538,686. Electric Time-Alarm Clock. Max Leibecke, St. Paul, Minn. Filed Feb. 28, 1895.

538,695. Electric Soldering-Iron. William H. Osborne, Prince's Bay, N. Y., and George R. Meitzler, Cincinnati, Ohio. Filed Feb. 13, 1895.

538,758. Preventing Electrolysis of Street-Pipes. Richard Watkins, Sacramento, Cal., assignor of one-half to John W. Guthrie, same place. Filed June 25, 1894.

538,764. Electrotherapeutic Apparatus. Franz Borsodi, Magyar-Banhegyes, Austria-Hungary. Filed Oct. 22, 1888.

538,773. Electric Tower-Clock. James H. Gerry and Frederick M. Schmidt, Brooklyn, assignors to the Self-Winding Clock Company, New York, N. Y. Filed Nov. 15, 1894.

538,777. Electric Watchman's Clock. Otto E. Hausburg, New York, N. Y. Filed April 17, 1894.

538,871. Electrically-Operated Switch. Henry A. Hartman, Philadelphia, Pa. Filed Jan. 12, 1895.

538,919. Absorptive Material for Storage-Batteries. Edward R. Knowles, Brooklyn, N. Y. Filed Oct. 15, 1891.

538,971. Cautery-Electrode. Michael F. Laughlin, New York, N. Y. Filed March 7, 1894.

538,983. Interior Conduit. Oliver G. Traphagen and Francis W. Fitzpatrick, Duluth, Minn. Filed Feb. 4, 1895.

539,000. Electrical Hose-Signaling Apparatus. William Fowler, Colorado Springs, Colo. Filed June 20, 1894.

539,017. Electrically-Arranged Hose-Coupling. William Fowler, Colorado Springs, Colo. Filed Nov. 30, 1894.

DESIGN.

24,292. Electric Heater Case. Jamas F. McElroy, Albany, N. Y. Filed March 7, 1895. Term of patent 14 years.

ELECTRICITY.

Vol. VIII. NEW YORK, MAY 22, 1895. No. 19

ELECTRICITY

Published every Wednesday by the

ELECTRICITY NEWSPAPER CO.

B. E. GREENE, Pres't. L. J. MONTGOMERY, Sec'y.

PUBLICATION OFFICE:

6 Park Place - New York

EDITORS: NELSON W. PERRY.
BURTON E. GREENE.
R. H. WILLOUGHBY.

BUSINESS MANAGER, - - JOHN L. GANS.

SUBSCRIPTION RATES:

United States,	$2.50
In Clubs of Five or More,	$2.00
Foreign Countries,	$4.50
Single Copies,	10 Cents

ADVERTISING RATES:

As Electricity reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.

Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

Entered at the N. Y. Post Office as Mail Matter of the Second-Class.

TRADE SUPPLIED BY
THE AMERICAN NEWS COMPANY,
THE WESTERN NEWS COMPANY,
And their Agencies in all Principal Cities.

EDITORIAL NOTES.

The Patent Situation and Other Things. So much has been said and written in regard to the deficiencies of the United States patent system that those who have not looked deeply into the matter have been led to think that it was utterly bad, without one redeeming feature. So great, in fact, has been the expressed dissatisfaction in certain quarters with some of the provisions of the Patent Office that there is and has been some danger that the law would be changed. If a change can be made for the better, well and good, but we should be absolutely sure before taking any step that it is not a step in the wrong direction.

"No man e'er felt the halter draw with good opinion of the law."

If we look back to see who these grumblers are and what their grievances, we usually find that they are people who have felt the tightening cord at some time or other in their existence or else who see the noose hanging over them like Damocles' sword, ready to descend at the next turn of the legal mill.

A most noteworthy illustration in point was brought to light in the Bate Refrigerator case where a patent of little public importance was made to assume an importance justified only by very much larger interests than those involved. The law says: "*But every patent granted for an invention which has been previously patented in a foreign country shall be so limited as to expire at the same time with the foreign patent.*" There would seem to be no ambiguity about that, and yet the General Electric and American Bell Telephone Companies, who owned valuable inventions that had been patented in foreign countries before they were patented here, turned heaven and earth to have this read differently so that it would mean that if it had been previously *applied* for in this country, although first patented abroad, its life should not be limited to the life of the foreign patent, but should continue throughout the full term of seventeen years notwithstanding the fact that the foreign patent might have expired a few years before. The General Electric Company and American Bell Telephone Company came into this case—not their own—and supplied the best talent at their command to prove that the law meant something which it did not say. Fortunately for the world, and we think for the best interests of the public at large, the United States Supreme Court could not be convinced that y-e-s spelled *no* and the result is probably that these two companies have not a good opinion of the law and would doubtless have it changed. Now let us suppose that the law is changed to meet these views. Would the inventor be the gainer thereby? In individual cases yes, but take the Berliner patent, for instance, which rightly or wrongly (it matters not which) was kept in the Patent Office fourteen years. Could the United States Government or the individual expect protection for the invention during this period of delay in foreign countries while protection was refused at home? Further, supposing that a rival becomes aware of the substance of your invention and straightway patents it in a foreign country. His patent is issued first and it is impossible to prove that he is not the original inventor. The law must assume that he is until it is proved that he is not. If it cannot be proved that he is not, then can the Patent Office grant the rightful inventor a patent on that which bears *prima facie* evidence of having been invented by another? From another point of view: If the inventor knows that by causing delay of issuance of patent he has everything to gain and nothing to lose, delays like the Berliner and Edison microphone patents will become more and more frequent and the verbal limitation of the law to seventeen years will become a dead letter. Provided the invention has been patented abroad, and it is known that a previous application for a patent for the same thing is pending in the United States Patent Office, the latter will act as a patent and thus serve not only as a check to the growth of competing enterprises but serve to foster a monopoly not contemplated by the founders of the patent system.

We believe that some changes in our patent system would be advantageous, but we also believe that no changes should be made until they are fully considered and their desirability established upon something decidedly more substantial than *ex parte* arguments.

We are of those who believe that most of the trouble arising from patent and other litigation involving the technology of the arts and sciences is due far more to an abuse entirely outside of the laws affecting the cases. We refer to the weight given so-called expert testimony. Do we have any expert testimony in our courts? Rarely, if ever. Experts in plenty are called to testify, and they do testify, but they are not there to assist the judge—they are there to assist the attorneys who are their clients just as the parties to the suit are the clients of the attorneys. They are selected by the attorneys and paid by them (or through them) just as and for the same purpose as the attorneys are selected and paid by their clients. The only difference is that the expert is sworn before he presents his argument and the attorney is not. The attorney is an expert in his way, but when he goes on the witness stand and testifies under oath his testimony has no more weight than that of any other reputable witness who is qualified to speak.

Here is the usual procedure in procuring expert testimony: Attorney A. comes to electrical expert B. and says—"B., I have the following case in court and I want your assistance. I wish you would look over this matter and tell me where, from an electrical standpoint, our strong points are and where are our weak points." B. takes the documents home and after studying them over finds, we will say, that the strong and weak points are about equally divided between the two sides of the case. Does he go onto the stand and tell that to the judge? By no means. He is employed to help the attorney to present the strongest case possible for his client and to slur over as insignificant or unimportant those points in which his client's case is weak.

He sits by the attorney and in addition to having drawn up a series of questions for him, intended to expose the weak points of the other side, coaches him with other questions suggested by the evidence given.

We know of a case, and it is not an isolated case by any means, but rather the rule, where the expert directed the whole of the examination both direct and indirect during a three days' examination, the attorney, one of the ablest in the country, being merely his mouthpiece, yet that expert himself went onto the stand and gave expert testimony. All this is considered legitimate, since it is done by both sides with the full knowledge and consent of the court. But is it expert testimony within the proper meaning of that term? Does the judge himself give it the weight attaching to unbiased expert testimony? By no means. This practice, which custom has established as legitimate, has brought the profession into disrepute, and we not infrequently see an expert who has testified to one thing in one suit testifying to another in the following trial of the same case, simply because his clients have changed in the meantime. And he does this with no more compunctions than has the attorney who has changed clients.

Absurd as this is it is no more absurd than to find well known experts upholding by the weight of their testimony that which they *know* is not true. They do not consider that they are lying any more than does the attorney who seeks to throw doubt upon the guilt of his client whom he *knows* to be guilty.

The positions of the two advocates, however, are not the same. The law says that everyone accused of crime is entitled to a defence, and carries this idea so far that it will not condemn a self-confessed criminal until it has been proved that he is a criminal, and if the latter have no one to defend his case the law will provide him with an attorney at the expense of the State, and expect that attorney to use every honorable means within the law to clear his client. Not so the infringer of a patent or a defendant in a civil suit. The law does not presuppose the invalidity of the patent upon which it has itself set its seal of validity. The defendant, let us say the infringer, however, may retain in his behalf the best expert testimony in the country, who, though knowing better, may still (and in the ordinary acceptation of the term) honorably give such preponderance of evidence in his behalf as to completely overshadow that adduced by the rightful inventor. But does this help the court in any way? Is it calculated to increase our respect for the laws? Does it not tend towards the subversion of that which, properly interpreted, is good and just? Is it not this very kind of testimony more than the inherent defects of our patent and other laws that have brought them into disrepute?

What can be more ridiculous, to cite a recent example, than the testimony of Prof. Henry Morton that the Attix wire was in fact a tube! There was one thing more ridiculous than this, viz., that tube or no tube it would serve the purposes of a conduit.

Such men as Prof. Henry Morton, C. F. Chandler, Chas. R. Cross, and others derive a large part of their income from expert testimony of this kind. Does any one doubt that Prof. Morton would have testified with better grace that the Attix wire was not a tube, and did not and could not serve the purposes of a conduit, if he had been employed on the other side? Does any one doubt that Dr. Chandler would have defined the functions of the Edison feeder and main arrangement in a very different manner had he been retained by the Westinghouse Company instead of the Edison Electric Light Company? Does any one doubt, in fact, that Prof. Chandler, Prof. Morton, or Prof. Cross would have expressed entirely different views if he had been retained by the *other* side in any case where these gentlemen have appeared as experts?

Does any one believe that any of these gentlemen assisted the court to a clearer understanding of the subjects of which they testified than he had before, or that it was intended that they should do so?

We do not wish to disparage testimony of this kind any more than we would disparage the functions of a skillful attorney, but we do believe that it should be relegated to its proper place, and not be weighed as "expert" when it is avowedly interested and partisan.

We believe our courts should call to their assistance when necessary the best expert talent available, but this assistance should be sought and paid for by the State and not by either of the parties to the litigation. We believe that When this is done there will be less fault found with our, generally speaking, admirable patent system. We believe that when this is done justice will more often be meted out, and we *know* that when this is done the reproach which now attaches to the expert witness and the suspicion of expert testimony will be removed.

* * *

The Lamp Situation.

The only sane reason why individuals or companies engage in business is that they expect to make money by doing so. There is no escape from this statement of fact. It is beyond dispute, and yet the present condition of the entire electrical trade indicates that many of those engaged in it do not believe in the axiom.

Goods in almost every branch are being sold at a loss; failures multiply. Reviving business throughout the country is not felt in our trade, except that more goods are being sold.

Looking below the surface of affairs, however, we find that even those responsible for present conditions believe fully in the statement of fact made above. Their only reason for being in business is to make money; they care little what becomes of the money of the stockholders in their various enterprises. They know that bankruptcy for the company they manage is inevitable. Meantime the *individual* draws his salary, and if he be a "prudent" man lays away something to carry him over a period of idleness.

There are at present engaged in the manufacture of incandescent lamps twenty-five or thirty concerns. The price of lamps has fallen to about one-quarter of what it was five years ago. At the ruling prices of January last, however, a fair margin of profit was left.

A few weeks ago the G. E. Company reduced the price to a point ensuring a loss of *three cents* on each lamp. The quality of the lamps was cheapened at the same time, but the lamps *still burn* for a time.

The question in which competing manufacturers are now chiefly interested is just what shall be their policy in the matter of price. There may be—indeed there are—some makers who do not know what their product costs and who will endeavor to meet the Edison price. They will last but few months.

There are others in control of some of the companies on salary who will display their business acumen by deceiving their stockholders as to costs, and who will advise meeting any price made by others.

There are others, and to these we look for the ultimate re-establishment of the lamp business upon a sound, profit-earning basis, who have large financial investments in their own companies, knowledge of the lamp business, sound business sense and common honesty, who will refuse to sell a barrel of lamps below the price which will return a fair profit.

The people who buy lamps may be led away for a time by the venders of cheap goods, but they must come back to those who make a reliable article. And in no line of manufacture is it easier to demonstrate the fact that the cheapest is not the best than in incandescent lamps. The user of lamps wants light. It is the light he gets which establishes the value of the lamp. The best lamp will win just as surely as the laws of commerce, established for centuries, still stand.

To take hold of as complicated a matter as the lamp trade, to straighten it out and purify it, is not an entirely pleasant task; but it is just what Electricity proposes to do, with the assistance of the leading lamp makers themselves. We shall make the campaign partially in our own way, but guided largely by the advice of others.

According to our judgment, one of the first things necessary to accomplish the desired result would be an open test conducted by some well known firm of experts, each lamp maker entering to pay a pro rata share of the fee. Electricity would take entire charge of this matter without any fee, the lamps to be bought in the open market by the experts themselves.

It would be found that the Edison lamp, the chief stumbling block in the way of a solution of the problem, is below a half-dozen other makes.

If any of the independent makers survive the present fight, which must be made once for all, it will be because they take concerted action and find some common ground upon which they can stand and give battle. No other basis upon which the business can be conducted at a profit is now apparent except perfect harmony and unity of purpose.

Electricity will do its full share. Patent suits are now being prepared on many detail patents. They will be used to intimidate purchasers and to drive out competition by reason of the expense necessary to defend them. It will be a part of our mission to keep the public informed, and any suggestions from our constituents will be gladly received.

The fight is on. It means to nine out of ten makers extinction unless an aggressive and harmonious policy is adopted.

Only a Small Part of Our Mission.

(From the Quebec Mercury.)

Electricity steadily brings the millennium nearer.

Mr. H. M. Littell has resigned his positions as general manager of the New Orleans Traction Company and president of the City and Lake and the Crescent City Railroads, and will take active charge of the Atlantic Avenue system in Brooklyn, N. Y.

Under the Searchlight.

Views and Opinions on Timely Topics.

THE MICROPHONE-TRANSMITTER IS NOT ESSENTIAL.

It will be learned with astonishment and disappointment by a great many that the United States Circuit Court of Appeals (Justices Colt, Putnam and Nelson) has endorsed the practices of the Bell Company and the Patent Office in the Berliner telephone case to the extent of reversing the decision of Judge Carpenter, of December 18, 1894, declaring the Berliner patent void. Judge Carpenter in the above decision said: "I think that their (the American Bell Telephone Company) acts were so gross as to forbid any inference except that they dishonestly delayed the issue of the patent." These words appealed so strongly to the sense of justice of the public that few expected the United States Circuit Court to do otherwise than concur in Judge Carpenter's decision. No reasons for this last decision have as yet been made public, and we must withhold further comment until they are made known. An appeal has been taken to the United States Supreme Court.

If the present decision stands, it gives the Bell Company a practical monopoly of the microphone transmitter for thirteen years longer. This is not the disaster that many people will suppose, however. The Bell Company have been industriously instilling the idea that the microphone is essential to the art of telephony for so long that the public has been led to believe that it was true.

As a matter of fact, however, a better transmitter can now be made without the use of the microphonic principle than has yet been made with it, and the simple magneto has been many times demonstrated to give good articulation between New York and Chicago.

Why Not Be Honest?

The G. E. report this year stated that new securities to the amount of $1,085,226.56 had been acquired during the year. We assumed, of course, as did every one else, that these securities were taken in exchange for apparatus. A gentleman who is closely connected with the United Electric Securities Company, writes that we are in error. He says the G. E. Company was compelled to take back worthless securities last year from the Securities Company for $394,000 at 80, the original price paid therefor. This is no doubt correct. Why did the G. E. directors try to conceal the truth? What is the further liability in this direction?

The Niagara Enterprise and G. E.

Is the Latter to be Used to Pull the Former Out of a Hole?

(From the U. S. Investor.)

We are informed that the Niagara Falls Power Company has proved a mistake. This company, it will be recalled, was organized to generate electrical power at Niagara Falls and convey it to Buffalo, where it was to be sold at a much lower cost than steam. In fact, there was no end to the expectations of the promoters of the scheme, it being claimed that power could be carried at a profit to Rochester and possibly New York City.

It transpires, we are informed, that the engineers promised more than they could fulfil, it being demonstrated now that the tunnels are a failure and that the loss of power is so great as to make electricity cost more in Buffalo than steam.

Only one thing remains to be done, namely, to build up a big manufacturing city at Niagara Falls, and this, we understand, is what the Niagara Falls Power Company intends to do.

It is reported that the Niagara Falls Power Company has agreed to give the General Electric Company forty-five acres of land at Niagara Falls and all the necessary buildings. Furthermore, provision will be made for taking its Schenectady property off its hands. It is surmised that this will be accomplished through the New York Central Railroad, which may find a use for it. The connection of the Vanderbilts with both the General Electric and the Niagara Falls companies might make this possible.

Methods of the Carbon Trust.

ELECTRICITY has already expressed its views with clearness and emphasis upon the situation of the various companies manufacturing electric light carbons in this country.

There can be no doubt in the mind of any consumer who gives the matter careful thought that the success of the National Carbon Company of Cleveland (the Carbon Trust) in their proposed plan of bottling up the entire business would be detrimental to the best interests of the community. The ideas of business put into practice by the managers of this Trust are almost identical with those of the G. E. Company, with which they are intimately connected. They will not tolerate competition if they can prevent it, and they hesitate at nothing that will operate to their supposed advantage. This similarity is natural. An inspection of the stock list of the Carbon Trust shows the same names exactly as the list of men who were instrumental in forming the G. E. Company. The two concerns are closely allied, and the reasons which would impel a station manager to withhold his patronage from the G. E. Company would be equally potent in regard to the Carbon Trust.

G. E. salesmen throughout the country have taken a hand in the carbon fight, and are trying wherever possible to sell Trust carbons.

At Minneapolis the General Electric Company sold a lot of apparatus at a very low figure, just about cost, and three carloads of arc light carbons at a fair price. At Paterson, N. J., they sold the local Edison Company a lot of central station apparatus and carbons sufficient to run the company for a year or more on about the same basis. This means that the G. E. management (or that part of it under the hat of Mr. Coffin) will sacrifice G. E. profits in order to make profits for the Carbon Trust, in which Mr. Coffin is a large stockholder.

The same fraudulent scheme of bidding is resorted to by the carbon people that made the T.-H. and G. E. Companies so malodorous. Purchasers who suppose there is any competition between the Brush, National, Standard, G. E. or T.-H. companies are very much mistaken. There is nothing of the kind; it is flat misrepresentation.

Some time ago the city of Jacksonville, Fla., asked for bids on arc lighting carbons and the following were the results:

Brush Carbon Company	$12.00 per M
National " "	11.00 per M
Standard " "	9.00 per M
Boulton Crown Carbon Company,	8.75 per M
General Elec. " "	8.25 per M
Washington " "	7.65 per M
American " "	7.53 per M

In the above bidding, if it had been found that the independent companies were the highest bidders the bids of the National, Standard and other Trust companies would have been withdrawn, leaving the contract to the highest Trust bidder. Of course the G. E. Company must supply National carbons.

It is well for large purchasers to give this matter careful consideration. The system of bidding is little better than a bunco game.

The Carbon Trust must stand on its own bottom.

* * *

Wheeler Gets the Atlantic Trust Company.

(From the Milwaukee Journal.)

George B. Wheeler, of Eau Claire, receiver for the Eau Claire Street Railway Light and Power Company, is now in possession of the Atlantic Trust Company of New York, having foreclosed its mortgage of $400,000.

Mr. Wheeler must have taken possession by proxy, as the old officers are still on deck.

She's Turned West by South.

In our last issue we printed an article on the performance of the Tesla motor which was illustrated by curves obtained from a 50 H. P. machine, showing the true H.P. expended, the apparent H. P. expended, apparent and true efficiencies, power factor and drop in speed. It was altogether a rather remarkable performance, but one of our friends who is well posted in direct current machinery, but evidently not up in alternating current motors, writes this kindly advice. We withhold the name of the gentleman through respect for his feelings, but the trunnions of our Searchlight being well greased, we follow his advice and turn it "west by south":

To the Editor of ELECTRICITY.

I judge from the article in your paper of this week, giving some very interesting data on a 50 H. P. two-phase motor operating in the Westinghouse shops at Pittsburg, that you are paving the way for a libel suit in a new direction.

If a statement that a modern 50 H. P. motor of any make, "when running unloaded, takes *only* 18 apparent H. P., or 36 *per cent.* of the *full load output*," is not a libel, it represents a condition of inefficiency which I hardly think any of our polyphase friends would care to have you publicly admit.

Surely you should not take the editors of the *Electrical World* and *Electrical Engineer* to task for reporting on a salt water pipe line between Niagara Falls and Buffalo as a proposed electrical conductor between these two points, when you report on such a motor as it is proposed to use at the Buffalo end of this power transmission, which requires 36 per cent. of its full load output to run it empty or unloaded. At this rate, we may expect to read soon in your columns the statement that it is estimated that it will require the full capacity of one of the largest dynamos installed at Niagara Falls to furnish sufficient energy in Buffalo to operate a fan outfit to keep the flies off Brother Huntley, though I believe it is reported that there are no visible animalculæ on Huntley.

Will you please let us know in your next issue, Mr. Editor (giving also an arrangement plan if entirely convenient), the tools operated (size, type and make), and length and sizes of shafting between this 50 H. P. motor and the tools.

If the trunnions on your "Searchlight" are not rusty, just head her about west by south from No. 6 Park Place, and give us the information asked for in the foregoing paragraph.

You have on more than one occasion honored me by a request for an article on Electric Power for your paper. Favor your many interested readers with the information and diagram asked for, and you will soon thereafter have an article on Electric Power from —— ——.

We refer our correspondent to the diagram published on page 243 as fulfilling his request, and now bespeak an early contribution from his pen, suggesting that it be on electric power as transmitted by *direct current.*

* * *

THE G. E. Company use their wonted bad judgment in bribing employees to get information as to the business of their competitors. If they will only make their wants known to ELECTRICITY we will tell them in our columns anything they have a right to know about any company in the United States. And ELECTRICITY has never paid one dollar to obtain information surreptitiously.

* * *

CHARGES of attempted bribery of inspectors and various other acts of corruption are now being openly discussed in insurance circles in this city. If the fight between the old Board of Underwriters and the Bureau of Electrical Inspection gets hot enough, considerable rascality will no doubt be uncovered and an improvement in methods will result.

* * *

"AN EXPLANATION DEMANDED.

But Criminals Do Not Usually Explain Their Crimes.

(From the Boston Standard.)

The public, as well as common decency, demands of the directors and officers of the General Electric answers to these absolute and direct charges by ELECTRICITY of fraud, swindle and corruption. They must answer and defend themselves against these criminal charges of wrong doing and rascality, or else it must be taken for granted that the charges are absolutely true. Silence no longer fits ;or shelters the directors and officers of an honest concern. Every sensible man must consider these charges to be correct until the directors prove them to be otherwise.

I believe that Electricity is correct, and that Dr. Greene, its able and accomplished editor, deserves a monument of bronze for exposing the doings of a vile set of manipulators, who have caused the people of Boston and New England to lose so many millions.

The country owes Electricity profound gratitude for its masterly expose of corruption.

G. E. FINANCING METHODS APPLIED AT LONESOMEBURG.

The manager-purchasing agent-secretary-treasurer-chief lineman-superintendent of the Lonesomeburg Electric Light, Heat and Power Company sat on an empty wire reel at the pine desk in the corner of the corrugated iron power house. The 4,000-hour lamp above his head burned at 19.9 watts per each of its 7 candles, casting a mellow light on the troubled multi-official. His brain revolved 999 r. p. m., cutting 1,000,000,000,000 lines of thought per second. Before him lay the unbalanced balance sheet of the year's business. The stockholders were to hold their annual meeting on the morrow and a good showing was expected by them. Figured as it might be, or had been for weeks past, there remained a deficit of $48.93. How to convert that into a profit the perplexed financier knew not.

The engineer-fireman-dynamo-tender-watchman had fallen asleep on a bale of waste half an hour before. The Lonesomeburg Stove Foundry and Plow Company's Monkey Wrench Variable Speed engine sped away at a 150-294 gait, delivering from 8 to 80 H. P. to the 800 light alternator. Just as the manager's multi-lobed brain reached the point of complete thought saturation the bartender at the Chalkdowne Hotel turned the switch on the three 50 C. P. lamps in the bar. At that instant the needle of the voltmeter on the station switchboard flew up against the case and stuck fast at 130 volts. The lamp above the manager's head glared at him with a Welsbachian glare. He started as if shocked from an Earth Magneto and an Electropoise coupled in parallel. Suddenly his eye rested on a copy of the third annual report of the General Electric Company. With an eagerness born of despair he snatched the pamphlet up and hastily scanned its pages. When he reached the column of "available assets" his attention was riveted for a moment by the item : "Fort Wayne Electric Company, $1,137,555." He read it a second time, then with an above C. P. glow illuminating his face he jumped to his feet, exclaiming :

"I have it. I'll just credit earnings with that bill of Jim Suttle's, which was 'dead horse' even before the sheriff sold him out. It was carried on the books for two years, then dropped as n. g., but I guess I can ring it in here and show the stockholders that we've made $3.08 instead of having lost $48.93 during the year."

Obituary—A. M. Wellington.

Mr. A. M. Wellington, the well-known civil engineer, and one of the editors of the *Engineering News*, died of heart failure in New York City on Thursday evening, May 16. Mr. Wellington was born at Waltham, Mass., December, 1847. His education was that of the civil engineer, and for twenty years he followed his profession, devoting his attention chiefly to railroad work. After a very wide experience in this line in this country, he was in 1881 made chief engineer of the Mexican Central Railroad, afterwards becoming assistant general manager of the same road and chief engineer of the Interoceanic Railway from Vera Cruz to the City of Mexico and the Pacific Coast.

As a result of his wide experience in railway location, he published in 1877 a treatise on the subject which attained a wide popularity. In 1885 he turned his attention to technical journalism, and after two years' service as an editor of the *Railroad Gazette* became in 1887 one of the editors-in-chief and proprietors of the *Engineering News*, which latter position he occupied until his death.

He was a member of the American Society of Civil Engineers, the American Society of Mechanical Engineers, the Canadian Society of Civil Engineers, the British Institution of Civil Engineers, and the Engineers' Club of New York City, and contributed many important papers to the published Transactions of these societies.

Mr. Wellington was a man of original mold, an inventor in the line of applied thermo-dynamics, and an authority upon the subjects which he made his specialties. As a writer he was clear and trenchant, and the engineering profession as well as technical journalism has sustained in his death a loss which will be keenly felt.

His wife and daughter survive him and will receive the heartfelt sympathy of his very wide circle of professional and personal friends.

Bribing Young Men To Steal.

The G. E. Company Again Caught in a Criminal Conspiracy.

Paying Westinghouse Employees for Confidential Information.

Proof has been secured of another attempt of the G. E. Company to obtain information from the Westinghouse works by bribery. The disgraceful plot differs from the blue-print steal only in scope and detail. In principle both are the same.

Among the correspondence which has been turned over to the Westinghouse officials are the following :

(From E. D. Mullen to E. G. Waters.)

Dear Sir : Schenectady office has written us desiring us to find out in any manner possible, even approximately, what the present output of the Westinghouse factory is, say the number of street railway motors, number of alternating lighting machines, etc., that are turned out each week or each month. They are very desirous of getting some idea of how much business the Westinghouse Company is doing in this direction.

I wish you would kindly take up the matter promptly and energetically, and use every means within your power to secure said information, sending it here as soon as you are able. (Signed) E. D. Mullen.

Dear Sir : I am glad to have gotten the information contained in your letter of the 18th, regarding the output of the Westinghouse factory and trouble with their men. You have started well, and if you can continue in like strain it will be a matter of a great deal of satisfactory information. (Signed) E. D. Mullen.

Dear Sir : I have your favor of the 13th, giving a very complete report on the output of the Westinghouse factory. I trust the same is reliable, and it is no doubt as thorough as it was possible to obtain. You will be justified in including the $25 in your expense sheets.

(Signed) E. D. Mullen.

(From the Go-Between.)

Then comes this important letter, dated "New Hotel Mahaney," Uniontown, April 25, and addressed to Mr. Waters :

"Mr. Van Cleve spoke to me before leaving the city about his fee for securing the Westinghouse data. I told him we would send him a draft for it at once. Will you please mail him a draft for $25, and send me the receipt, which I will sign, as he does not want his name to appear on our records ; also please send him his letter, and the original list, so that he can destroy it. Address it John M. Van Cleve, Wilkinsburg, Pa.

"Yours very truly,
"William S. Beatty.

"P. S.—I inclose herewith Allegheny Traction Company pass to power house. Please pardon my negligence for not returning it before. B."

Mr. Mullen, named above, is the manager of the G. E. Company's Philadelphia office, and Mr. Waters holds the same position at Pittsburg.

COPIES OF RECEIPTS.

In connection with this letter the Westinghouse people have a copy of a receipt signed J. M. Van Cleve, dated May 4, reading that he had received $25 from W. S. Beatty for services rendered. They also have a copy of a receipt dated May --, signed W.S. Beatty, acknowledging that he had received from the General Electric Company $25 for payment to J. M. Van Cleve.

In the blue-print steal it is on record that Mr. Coffin himself was cognizant of the whole transaction.

In this matter it is different. Mr. J. P. Ord, Mr. Edward Clark or Mr. Henry W. Darling must have been aware what the money was paid for. It is time for these gentlemen to explain.

The transaction of itself is of slight importance, but coming at this time it shows clearly that there must be no cessation in the warfare against the corrupt management of the G. E. Company. That management is actuated by the same motives as it was two years ago, and has no more conscience.

Starting into business with a charter procured by bribery, bribery has been the watchword ever since. Dishonesty and thievery have been so common, from the heads of the company, down that proficiency in roguery has been accepted by the employees as a sure way of getting promotion.

When a travelling-bag full of stolen blue-prints arrived at the G. E. office in the former case, the young man who disgraced himself and ran the risk of going to the penitentiary to save Mr. Coffin from a like fate, called in office boys and officers of the company alike to inspect the contents of the bag and glory with him in the great coup.

Doubtless Mr. Mullen has received congratulations from his superiors for his part in this later conspiracy.

If the Westinghouse Company does its full duty to the public it will bring some of these rascals to trial.

Personal.

Mr. Charles D. Shain left New York on Friday to spend a week in Chicago.

Mr. S. A. Douglass has gone on a hurried trip to Cleveland, Detroit and Toronto.

Mr. L. A. Ferguson, purchasing agent of the Chicago Edison Company, was in the city last week.

Mr. C. E. Stump, late of the *Street Railway Gazette*, will sail for England this week, to be gone two or three months.

Mr. Frank Mason, superintendent of the Brooklyn city service, sails on the same steamer in company with Mr. Stump.

Mr. Eugene Phillips, of Providence, was in New York last week to attend a meeting of the leading wire manufacturers.

Among our out-of-town visitors this week have been Mr. S. M. Hamill and Col. L. H. Rogers, of the Brush Company, Cleveland.

Mr. P. H. Alexander, who has been confined to his bed for some weeks, has gone on a vacation of a few weeks to recuperate.

Mr. Charles A. Merritt, of Birmingham, Ala., is in the city and will endeavor to make arrangements for the manufacture of his new incandescent lamp.

Mr. Jamas W. Godfrey recently returned from a successful hunting expedition. Mr. Godfrey expects to sail for Southampton in a few weeks to meet his family, who are now abroad.

Mr. Gilbert Wilkes, who is well remembered here through his connection with the Edison General Company, is now doing a good business as consulting engineer in the city of Detroit. He has recently been in New York on business.

Col. H. C. Adams has taken charge of the New York offices of the Ft. Wayne Electric Corporation. It is understood that Mr. McDonald's outside interests are taking more and more of his attention, and that he wants to be relieved as far as possible of the active management of the Corporation's affairs.

THE STATUS OF THE GAS ENGINE.

A Statement and Discussion of the Subject Before the American Society of Mechanical Engineers at Their Monthly Meeting April 10, 1895.

The subject of the gas engine, which has been so fully treated in these columns from time to time and is attracting such wide attention among central station men as likely to assume importance in their future practice, warrants us in reproducing with considerable fulness the interesting discussion which took place on the date named:

Mr. Reeve—Mr. Chairman and gentlemen: The subject before the meeting to-night is the present status of the gas engine, and, as I understand, my sole duty here this evening is to state the case for discussion.

The status of the gas engine, as the status of every other thing whatever in the world, depends entirely upon the surrounding conditions. A plant exists merely because the sun shines and the seed has been planted. Unless the surrounding conditions are favorable the plant cannot exist, and the amount of its growth and the character of its growth depend entirely on the surrounding conditions. The gas engine follows this general law, in that its status to-day is what it has been forced to be and what it has been allowed to be by the general commercial and engineering conditions of the world. The status of the gas engine, therefore, is the status of the power question of the world, and the importance which the gas engine takes in the field depends as much upon the condition of other forms of power as it does upon the condition of the gas engine itself. Now practically all other power that is in use is steam power. I do not mean in saying this to lose sight of the tremendous amount of water power that is in use in this country or the world to-day. But water power is restricted to certain localities and the gas engine is not. It comes into competition only with those forms of power which are applicable to almost any locality or set of conditions; and, aside from gas power, steam power is almost the only other occupant of that class of prime movers.

The condition of steam power engineering has very rapidly altered during the past few years, at any rate within the past ten or fifteen years. The steam engine started off as the forerunner really of the factory. Perhaps the factory started first on water power. But practically the factory and the steam engine grew up together; and the idea that we, nearly all of us, have carried in our minds of a commercial manufacturing plant driven by any power was a set of tools driven by a central motor through the medium of a line of shafting and a number of belts. That scheme of industrial works grew in size and importance until it had reached tremendous proportions, and in certain lines of industry it still survives and will continue to survive in the future in still larger sizes and on still more important a scale. But for the vast majority of industries, those species of manufacturing which involve a varied number of processes and departments and involve the production of a comparatively complex commodity—such, for instance, as the building of steamships or railway cars, or the complicated machines involving wood work and iron work and steel forging work, and all that sort of thing—the modern factory is a collection of factories. The various factories may be merely departments, merely various rooms in one building or on one floor. But at any rate the factory now consists of a large number of departments, and those departments are quite distinct. They often run entirely independently, have separate foremen or superintendents, run different hours and have different classes of labor. In some, labor is a small item and power is larger. In others, power is a small item and labor is the principal feature. All these varied conditions make it almost impossible for such an establishment to be driven by one central prime mover. In the first place, distance of transmission comes in and consequent losses. In the second place come in varying conditions. Every engineer knows that no piece of apparatus can work well under varying conditions. We have therefore seen grow up in the last few years the modern industrial works in which the power has to be transmitted quite a distance and subdivided among a large number of different sorts of tools. This, of course, was first attempted by shafting and belting or by rope drives. But it is evident that the loss by transmission in all these various transitions and distances of transmission are very great. Consequently we have seen other schemes tried. First came the subdivision of the steam engine itself into a large number of units, and we have only to look about us in our large factories to see steam-driven plants where the power is furnished from the central boiler plant to anywhere from ten or a dozen to seventy different engines scattered all over the works—sometimes twenty or more in one room. Sometimes the losses in steam transmission are under average conditions less than for shafting and belting. Of course no cast iron rule can be given for all conditions. But the subdivided steam plant has come in to stay. Of later years, superseding the subdivided steam plant, came in first compressed air and then electrical transmission and subdivision of power.

I have given this resumé of the changes of the power question to show that the problem of the present is economical transmission of power, not economical development of power. Of course economical development at the original point of production is of great importance, but it is vastly more important to transmit it economically, because the losses in transmission can easily exceed the largest losses possible in production.

Now, those of you who have spent any time on the problem of the subdivision of power or its transmission have seen that none of the systems heretofore provided satisfy the question. They all involve tremendous losses in transmission. They all involve heavy first cost, heavy expenditure for generating plant, transmission plant and redeveloping plant at the other end. For instance, in electrical transmission, if your total works need a thousand horse-power, besides your thousand horse-power of boilers you must follow with a thousand horse-power of steam engine, a thousand horse-power generator, your mains for carrying the electric power, and then on top of that a thousand horse power of motors. That is, of course, losing sight of all small factors and percentages of loss. Now the present status of gas power in this country or any other, and also of its immediate promise for the future, depends upon this statement of the problem in this part—that gas power offers the ideal solution for the subdivision and transmission of power, the mechanical difficulties for the time being lost sight of. In other words, let us suppose that a large industrial plant, requiring say 1,000 H. P., subdivided into say 50 different units, which are utilized at various points in different buildings on different floors at different speeds for different hours during the day, under different conditions of varying and steady load—suppose that in such a plant as that we install a 1,000 H. P. gas generator or its equivalent, and then lead from it or from the holder to a large number of gas engines large central gas mains—it is evident that the first cost is away below that of any system with the possible exception of the subdivided steam plant, where our boiler plant corresponds to our generating plant, our steam mains to our gas pipes, and our steam engines to our gas engines. But there is one big advantage which a gas plant has over a steam subdivided plant in point of operation, and that is that in the steam subdivided plant, no matter how large a proportion of the load be off, the central generating plant must be run, and the fixed charges of running cannot be altered. Steam must be kept up, the boilers must be kept hot, the stack, if there be one, must be kept hot, and the labor must be there to take care of the whole matter. I have myself tested one factory in which for a large proportion of each day the efficiency for the transmission of the power between the boiler plant and the work was 5 per cent., simply because they had to keep the whole plant going in order to move one small department. With the gas plant that entirely disappears. Your gas generator works for a certain number of hours a day on whatever load or capacity is best suited to produce maximum economy, and as we all know there is only one point in capacity in which any apparatus can work at minimum economy. During those certain number of hours a day the generator makes gas and stores it in the holder. The generating plant is entirely unconscious of the consumption of power provided it be large enough to fulfil all demands. The consumers of power, the foremen of different departments, are as unconscious as is the generating plant of the consumption of power. They simply know that all they have to do is to turn on their gas and start their engine. They may run twenty-four hours in a day while the gas generator runs eight, provided the total maximum production of the gas generator is large enough to cover the whole output of power. The comparison between such a gas plant and any plant relying upon transmission and subdivision of power, by compressed air or by electricity, or by any scheme wherein the power is first developed by the steam engine and then converted into another form and then converted back again—a comparison between the gas power plant and any such plant as that is really hardly possible from the economical standpoint. The operation of any such gas plant would be incomparably more economical than that of the compressed air or the electrical or the hydraulic system of transmission of power.

You will notice that I have entirely left out of the question the mechanical side of it, which I purposely wished to do. But for the merely commercial side there is an absolutely unlimited field for the development of power and its transmission and subdivision in industrial works by means of the gas generator and the gas engine.

The next big argument for any plant of that sort for division of power is that in every industrial works—the supply of power or steam—the supply of power is made to correlate with the other portions of the work. To be more plain, perhaps, in nearly all of our large textile mills in New England, and in a great many other forms of industry, the steam is used as much, and sometimes more, for heating purposes and boiling and dyeing than it is for power. In fact the big promoter of steam power in New England, where it has proved an indispensable auxiliary of water power, is the fact that the steam had to be had anyhow. That is true also of compressed air plants. There are a great many forms of factory where compressed air is indispensable for blowing, furnishing draft, cleaning and innumerable purposes to which it can be applied, and in a great many plants compressed air is used to transmit and subdivide power where no other system would be tolerated, simply because the compressed air has to be there any way, and the compressed air mains have got to be there, and they might a great deal better use it for power. The same thing applies to electricity. Those factories relying on the electric current entirely for light may often bring the power question into an entirely secondary importance compared with light. If they have got to have their central engines and generators and mains for the production and distribution of light, and if they need light more than power, then of course the electrical transmission of power is the thing, without any regard to the general arguments against. But this same factor of the correlation of the system of transmission of power and the system of transmission of other forms of energy needed in the works applies also to gas. In fact the gas producer has reached its present state of perfection largely owing to the fact that gas is the most economical form of fuel for a large number of industrial devices—metallurgical, for glass works, and for a large number of sorts of cooking and heating and baking, where exact temperatures and exact control of temperatures have to be had. In all these plants the power may again become secondary to other purposes in the factory; and in those plants where generators have already been installed for the purpose of supplying fuel gas, the gas engine follows as a natural sequence.

The reply to this side of the discussion—and you will remember that I am merely stating the discussion—the reply to this side of the discussion is that the mechanical difficulties have not yet been overcome; that the gas engine to-day, after having had spent on it the best energy, or of the best energy, in the line of mechanical engineering which the world has been able to produce for some thirty years, is still more crude in a great many mechanical features than was the steam engine of a century ago. It is still very heavy. In nearly all of the devices only one impulse is received by the fly-wheels for every two revolutions; in the case of the single acting engines only one is received; so that the fly-wheels are heavy. The regulation, as a rule, is accomplished by simply dropping out a certain proportion of the impulses instead of varying their strength; and the necessity for the ignition of the charge in a minute fraction of a second has led until very recently to extreme uncertainty in the matter of ignition and also on the question of perfection of combustion. That last is not so marked a feature, because even with poor combustion the gas engine is an exceedingly economical prime mover. But the mechanical difficulties still stand in the way of the accession of the gas engine to the proper field in which it belongs—that is, the universal factor for the production and transmission and subdivision of power in industrial works.

At the risk of being considered rather superficial in skimming over this subject, I will take one step into the future and say that while gas engines have hitherto been almost entirely run with illuminating gas, yet already there has been considerable done in the way of supplying gas engines with special producer gas from special producers built just for that purpose. There has also come upon the field—I will just mention it—the incandescent gas burner, that has just begun to attract wide attention as being an established fact. These two coupled together—first that the gas engine can be run much more economically upon producer gas, not illuminating gas, than it can upon illuminating gas, and second that there is a means attained of producing illumination by a non-luminous gas—lead us to the surmise—perhaps I should not state it as a surmise, I will state it as a hypothesis, which I hope to hear discussed—that the near future will see the distribution of energy—all energy—which is derived from coal in the form of a non-luminous cheaply-produced fuel gas—that this gas will be relied on entirely for power, for lighting where gas lighting at all is permissible, and where it is not, where the electric light is needed, that electric light will be produced through the medium of gas engines, and that this same gas will be used for all sorts of fuel and heating purposes—heating, domestic heating and cooking, and industrial heating of all sorts.

I have tried to make as brief a statement as I could of the gas engine problem as it appears to me to-day, not on the basis of the condition of the gas engine itself, but as a statement of its possibilities, the demands which are going to be made upon it in the near future, and what the near future may bring forth in the way of a powerful auxiliary to aid in the adoption of the gas engine as the universal prime mover.

THE UTILIZATION OF ELECTRICAL ENERGY FOR COOKING AND HEATING PURPOSES.—II.*

BY R. E. B. CROMPTON,
President of the Institution of Electrical Engineers.

By means of the platinum thermometer already described we have been able to measure with a high degree of accuracy the amount of electrical energy that is required for various forms of heating and cooking apparatus, and the following four tables give a fair idea of the cost of heating surfaces required—first for roasting or baking or frying. The second table gives the cost of heating surfaces to a lower temperature such as is required for warming the air of a room or for airing linen or similar purposes. Tables III and IV give the cost of the energy required for boiling water in small quantities, and are interesting as they show that in case we are using electricity in the manner in which it compares least favorably with solid fuel, i. e., for the boiling of water, we can, with an ordinary electrical kettle, switch on the current and obtain a cup of tea at a cost of less than a farthing for a single cup, or half a farthing per cup if several are required.

TABLE I.—*Showing energy required to raise a heater plate from 50° F. to 400° F. in half an hour.*

Time.	Energy in B. O. T. units. 1,000 watt hours.	Cost at 4d. per unit.	Temperature, Fah. scale.
0	0	0	50 deg.
10 min.	0.116	0.46d.	257 deg.
14 min.	0.164	0.67d.	322 deg.
21 min.	0.248	1.0d.	357 deg.
30 min.	0.404	1 61d.	400 deg.

TABLE II.—*Shows the energy required for a radiator plate, such as we use for heating the air of a room.*

Time.	Energy in B. O. T. units.	Cost at 4d. per unit.	Temperature, Fah. scale.
0	0	0	50 deg.
10 min.	0.091	0.364d.	171 deg.
30 min.	0.277	1.1d.	240 deg.
40 min.	0.350	1.4d.	257 deg.
50 min.	0.430	1.72d.	261 deg.
60 min.	0.500	2.0d.	264 deg.

TABLE III.—*Shows the energy required for boiling one pound of water in a tea-table kettle.*

Time.	Energy in B. O. T. units.	Cost at 4d. per unit.	Temperature, Fah. scale.
0	0	0	50 deg.
10 min.	0.075	0.32d.	212 deg.

TABLE IV.—*Shows energy required by a smaller kettle containing three-quarter pound of water, i. e., sufficient for two cups of tea.*

Time.	Energy in B. O. T. units.	Cost at 4d. per unit.	Temperature, Fah. scale.
0	0	0	50 deg.
12 min.	0.051	0.2d	212 deg.

Although these tables show the amount and cost of electrical energy required to raise various kinds of heating surfaces to a certain temperature, something more than this is necessary to enable you to form an opinion of the value of heating and cooking by electricity from the point of view of economy.

When the subject is first mentioned even to a skilled engineer, his first idea is that in almost every case electric heating must be too expensive to become general; he knows the wastefulness of steam generating plants is such that not more than six per cent. of the heat energy in the fuel can be distributed to the consumer in the form of electrical energy, and he is not to be blamed if he concludes from this that there is no chance of using the re-converted heat from this energy in competition with the heat which the consumer can obtain direct from burning the fuel itself. But the fact is that all these opinions are based on an insufficient knowledge of the economy—or rather extraordinary want of economy—of cooking as carried on at present by the ordinary kitchen grate. Now that we can actually measure the heat that is required to carry on cooking operations, we are astonished at the smallness of the results obtained by present methods. The percentage of the heat units of the coal burnt in our kitchens which is actually utilized in cooking the food is in all private houses and in most hotels and clubs so ridiculously small that I should hardly be believed if I quoted you the figures which we have obtained; it is not too much to say that in many cases not more than two per cent. is utilized. This enormous waste is due to the fact that, with the sole exception of boiling and stewing, all the remaining operations of cookery depend on the radiation of heat to the substance to be cooked. Take, for instance, the process of grilling a chop—consider how much coke has to be burnt before a bed of glowing coke fit for the purpose is obtained, and after the clear grilling fire is in order consider that seventy per cent. goes up the chimney, sixteen per cent. is radiated into the room or employed in roasting the cook—male or female as the case may be—it is not difficult to understand that the chop itself does not receive more than two per cent. of the total heat units. On the other hand, with a properly arranged griller heated by electrical means fully sixty-five per cent. of the heat energy in the electricity is utilized in the meat Take again the case of the ordinary oven attached to the kitchen of a small private house—the oven may be used on an average three hours a day, but if solid fuel is used the oven must be heated continuously from the time that the kitchen fire is alight in the morning until late at night, so that in this case the total heat usefully radiated from the sides of the oven to bake and roast or brown the food within it generally amounts to a very trifling percentage of the fuel used.

The comparison with gas cooking, although not so striking as when solid fuel is used, is still very favorable to electricity, for although in the case of the gas oven considerable economy results from the gas being used only at the time that the oven is required for cooking, yet in this case the heat is communicated to the food by radiation from gas flames so that it is necessary that a current of air must continuously pass through the oven in order to ventilate it and carry away the products of combustion. This ventilating current also carries away with it at least eighty per cent. of the heat units obtained by burning the gas.

The electrical oven consists, as you see, of a rectangular box having double sides at bottom, top, back and front; the inner surfaces of the inner plates are the electric radiators, and the space between them and the outer plates is filled with a non-conducting material; the door closes practically air-tight, no ventilating current of air is necessary; thus all waste of heat being prevented in this case, when the oven is filled with food more than ninety per cent. of the heat energy can be utilized, and thus although possibly five to six per cent. only of the heat energy of the fuel is present in the electrical energy, ninety per cent. of this, or four and one-half per cent. of the whole energy, actually goes into the food, and thus the electrical oven is practically twice as economical as any other oven whether heated by solid fuel or by gas.

---

*Lecture delivered before the Society of Arts, London, Eng., on Wednesday evening, April 24th, 1895.

Thus far I have dwelt at some length on the economical question : it is time to say something on the questions of the convenience and of the superior results which can be obtained by electrical means.

I have already spoken of the large loss by radiation which occurs when solid fuel is used, or to a less extent when gas fuel is used. This has the great inconvenience of injuring the quality of food that is being prepared in the kitchen, of keeping the cooks in a heated and unpleasant perspiring condition, and I might enlarge considerably on this point. An electrically-worked kitchen may be kept as cool as a dairy if it be desired, and the effects on the quality of the cooking, and on the health and tempers of the staff, must be experienced before it can be fully appreciated. I have also mentioned in the case of the gas oven the necessity for allowing ventilating currents of air to pass over the surfaces which are cooking. These currents of air dry up and harden and take away the flavor of the outer portions of the meat. Any connoisseur can detect this in the case of joints cooked in a gas oven. With the electrical cooking, the absence of such ventilating currents and the stillness of the air prevent the above-described drying and hardening action, the meat is found to be tender and juicy right up to the extreme outer surface, it is browned only to a sufficient extent to please the eye and the palate. Again, the facility for regulating the temperature to any degree of nicety, which we can give with any of the electrical cookers or ovens, is very highly appreciated in the higher walks of the culinary art. Most skilled cooks will tell you that it takes much experience to satisfactorily manage an ordinary oven so as to bake or brown pastry or sweetmeats, and always give a uniform result. When these skilled cooks use electrical apparatus for the first time, they almost invariably say : A child could learn the ways of this oven in a few hours, and produce as good results with it with absolute certainty as I could with an ordinary oven after I had known it and learnt its ways for years.

All users of electric light are interested in the development of electric heating and cooking; you all of you have been told that the cost of electrical supply may be greatly reduced if it can be utilized during the daytime for other purposes in addition to lighting. Although the day may come, and I feel certain will come, that electricity will be used for power purposes within our homes to an extent undreamt of at the present time, yet such a development must be necessarily of slow growth, we must be educated to the point of using power for many occupations and pursuits which have yet to be invented; but the day of electric cooking is not far distant. There is no reason why in a few years to come quite a majority of the users of electric light will do all cooking operations of the nature of roasting, baking, stewing, frying, by electrical means, perhaps still employing solid fuel for boiling purposes only, and this in connection with a suitable furnace for supplying the whole of the hot water required for a household.

Time does not allow us to go into very many interesting matters connected with electric welding, brazing, soldering, roasting of ores, drying of paints, and many other industrial operations in which electrical heating can be advantageously employed. I am also unable to do more than state the bare fact that the managers of several theaters, notably the Vaudeville, have found that electric radiators form a most convenient, safe and economical method of heating the auditorium of a theater. During the late severe frost these radiators were found to be a great convenience in large shop fronts to prevent the lowering of the temperature and hence the freezing of the moisture on the plate glass which otherwise obscured the contents of the windows.

London Notes.

(From our London Correspondent.)

ELECTRIC TRACTION.

Some time ago I reported to you that the difficulties at present impeding the progress, or indeed the introduction, of electrically-propelled conveyances for street and road traffic were being considered by the London Chamber of Commerce (Electrical Section) who were bringing the matter before the Board of Trade. In the House of Commons recently a member asked the president of the Board of Trade whether he intended to take any steps to allow vehicles propelled by stored electricity or petroleum, if unobjectionable to the public, to be freely used in this country. In reply, Mr. Shaw Lefevre said he was about to introduce a bill upon the subject. This information was received with cries of "Oh !" and laughter, but why is more than I can conceive, for this is a question far more important than some which have been discussed lately.

The year 1894 saw very little done in this country in the way of electric railways or tramways. The year 1895 will, however, see several lines completed and opened. Among these may be mentioned the Bristol and Kingswood electric tramways, which will be finished in a month or two, the Brighton and Rottingdean Electric Seashore Railway, to adjoin Volk's Electric Tramway on the south coast. There are several others which will probably be ready in 1896 or 1897, among them being two important underground electric railways in London. After considering the matter for two years and more, the Coventry folk have ordered plant for equipping with electric power their old horse tramway lines, which have been lying idle for nearly two years. There is a tramway scheme in progress for Dublin, one suggested between Dublin and Dundrum, one proposed for Halifax, a railway scheme on hand for Llandudro (in Wales). So with all these it seems we are now waking from our long sleep, and things will doubtless go ahead, though we are a long way behind the States in this matter.

ENGINES FOR ELECTRIC LIGHTING WORK.

During the last few years the question of what is the most suitable engine for use in central stations has been discussed over and over again in the London engineering and electrical journals. It seems, however, that a more general and concentrated discussion will take place before the Institution of Electrical Engineers as the outcome of a paper which will be read on May 9 by Mr. Mark Robinson (of Willans & Robinson). In his paper, which is very lengthy, Mr. Robinson deals exhaustively with many moot and debatable points, and judging from the interest the matter has recently excited over here and from rumors that are about, it seems that the discussion will have to claim several evenings to itself. Mr. Robinson's paper is entitled "On the Recent Development of the Single-Acting High-Speed Engine for Central Station Work."

THE UNDERWRITERS' NEW RULING.

In the subjoined interviews ELECTRICITY has sought to show, in the most impartial manner, how the action of the Fire Board is regarded by those interests which are most directly affected by the recent promulgation of the Board that a double-braided insulated wire—Attix wire—is a tube :

Mr. J. E. Ham, manager of W. R. Brixey's Kerite products, said: "I regard the action of the Board, in specifying that Attix wire shall be used for interior work without conduit, to be an unjust discrimination against all other wire manufacturers. They could, with as much propriety and as great a sense of justice, declare that kerite wire or any other insulated wire could be used to the exclusion of all others. Any wire manufacturer, with proper equipment, can make as good a wire as the Attix—in fact we make such a grade now for underground service or use in damp places. I shall make formal request of the Board to know why our wire shall not be permitted to be used under the same conditions as the Attix.

"The wire manufacturers for years past have exerted every possible effort, employed all available science and skill, and expended vast sums of money to produce grades of insulated wire that would be so safe to use that the Underwriters themselves would be satisfied and convinced that their requirements had not only been fully met but even exceeded. That such results have been accomplished every one knows. To begin now a retrograde movement not only invites disastrous consequences, but threatens most seriously to retard the higher advancement of the art as well as to restrict the applications of electricity. It behooves every interest connected with the electrical industry to employ all possible safeguards; otherwise the public will lose that confidence it has taken so long to gain. The consequences in that event can not fail to disastrously affect the trade."

Another gentleman, manager of one of the leading wire manufacturing companies, but who does not desire to become officially or personally identified with the discussion, said: "I cannot conceive by what stretch of imagination, or of language, a braided wire can be called a tube or conduit, nor can I understand what should impel the Board of Underwriters at this day, when all effort and all skill are being directed towards securing the very highest standard of excellence in electrical work, to take such a step backward as the recommendation not only implies but expressly states. Everybody who has had experience in handling cotton yarn knows that it contains 15 per cent. moisture even when supposed to be dry. When placed in proximity to damp places it absorbs moisture to an alarming degree. To put two, or even three or four braids of it on a wire, even if the braids be treated with water-proofing and fire-proofing compounds to the point of complete saturation, the moisture in the cotton is not wholly expelled. Every one knows, too, that it is an immutable law of nature that material substances deteriorate, and fire and water proofing compounds are no exceptions. In due course of time, and a comparatively short period at that, these outer coverings of the wire have lost practically all of the qualities claimed for them when new. The result follows that your fire-proof and water-proof wire has become both highly inflammable and capable of absorbing moisture in a steadily increasing degree. To bury such a wire in plaster is the height of folly, to say the least.

"These observations are not made because the product of a competing company has been specified as the grade to be used for interior work, but are applicable to any wire similarly made by any company.

"Presuming that as a result of the adoption of this rule by the Board a fire should at any time or from any mysterious or unknown cause occur in an electrically lighted building, the insurance companies and public generally would lay the blame to the use of electric current. The insurance companies would be the first to become frightened and they in turn would frighten the people who own the buildings. What would follow? That feeling of confidence in the safety of electric service which it has taken long years to create would be so shaken that it would take years to restore it. The capital that is now being invested in electrical installations would be diverted to other channels and the trade suffer a most serious blow.

"The Attix wire, or a similar grade, can be made by any wire manufacturer, and if the new rule remains in force the market will be flooded with wire that may be denominated in all truthfulness worthless stuff."

The resolution of the Board is not interpreted alike by wire manufacturers. A high official connected with one of the leading companies is of the opinion that any wire manufacturer who can make the Attix "tube," or covering, or one as good, can thereby produce a wire that will in every condition fulfill the requirements of the Board. This same gentleman has long contended, and remains of the same opinion yet, that a wire covered with a proper insulation can safely be buried in plaster. "The difficulty here," he said, "lies in the inability of most wire manufacturers to make an insulation that will withstand the deteriorating influence of time as well as the destructive effects of damp plaster. In buildings where the maximum current consumed under any condition of service is below the carrying capacity of the wires, they can properly and safely be buried in plaster, provided, of course, that they are sufficiently well insulated. But in large office buildings, where the demand for current often exceeds the capacity of wires installed, some method that will permit the easy and quick removal and renewing of wires is not only desirable but almost absolutely necessary. The conduit method is thus far the only solution of that problem. It is plain that the Attix wire, with its tube of braid, cannot be considered a substitute for the conduit."

By defining a braided wire to be a tube or conduit, the new rule of the Board virtually substitutes the wire for the conduit and renders superfluous the use of the latter. This is the interpretation of the rule by the manufacturers of conduit, to whom the adoption and enforcement of the rule means a more serious blow even than to the wire manufacturers. Of this class of interests the Interior Conduit and Insulation Company is the most representative. In a late issue of the *Architects' Electrical Bulletin*, published by this company, is an editorial statement, in which Mr. Edward H. Johnson, president of the company, clearly states his views. He says: "We will readily admit that the Attix wire is of high grade, but that is not the point. Putting an extra coat of braid on a wire, no matter how it is applied, does not constitute a tube or conduit, and the rules demand conduits. The Attix wire is one thing, not two, and its outermost insulation is integral with and inseparable from its other insulation almost as much before it is put up as afterwards. Once slapped into the plaster, no power in the world could remove the copper inside without bringing away all the insulation; and to get at the wire all that covers it would have to be broken, chopped and ruined.

"If there is one fact demonstrated in the advance of electricity it is that the method of wiring edifices by means of the system of interior conduiting has done more than any other element to insure the success of electric lighting, and to make it at once convenient, safe and scientific. . . It is impossible to believe that electricians, architects, insurance men and others are about to relapse into the barbaric conditions of the days when a wire was buried haphazard in the walls and at once began a process of degeneration that ended in a disastrous fire or in its removal by chisel and pick."

Supplementing the above, Mr. Johnson said, in a conversation with a representative of ELECTRICITY:

"The action of the Board is not only unjust, but its attempt to force people to believe that a wire is a tube is both absurd and ridiculous. Why the Board should, or how it can, afford to form an alliance with a commercial enterprise, in discrimination against and to the detriment of other enterprises in the electrical field, needs some explanation on the part of the Board before its action can be comprehended or fully understood. Suppose, for instance, that a layman, having no practical knowledge of electrical work, but knowing enough to distinguish a tube from a rod, and who contemplated erecting a building, should inquire of the Board what he should use for interior wiring. Being told that Attix wire is a tube, he would accept the statement as correct, assuming, of course, that the Board had adopted the very latest and most improved appliances, and he would instruct his architect to specify Attix tube. During the gentleman's absence in Europe, we will suppose the house to have been built. Upon his return he finds that some of the circuits in the building will not work. He directs that the wires be withdrawn. But to do so he learns that a tube isn't always a tube. A workman with hammer and chisel digs out the wire and mutilates the building from attic to cellar. In that case I contend that the owner of that house has good and sufficient grounds for action against the Board. By its official promulgation it had declared a wire to be a tube. Upon that recommendation the owner had used what he presumed to be tube or conduit, but which was instead a braided wire tightly and immovably imbedded in the plaster."

The electrical construction and equipment companies who do the interior electrical work in New York will not be inconvenienced by the action of the Board. Mr. James F. Hughes, general agent of the Metropolitan Electrical Equipment Company, as a representative of this interest said:

"I have the highest personal regard for the inventor of Attix wire, and am glad to know that after years of persistent effort Mr. Attix has succeeded in making a wire that has received the approval of the Underwriters. In so far as this company is concerned, the policy heretofore existing will be continued. In wiring buildings already erected we shall continue to do our work in a first-class manner, using such grades of the best material, be it wire, molding, brass or iron-armored conduit, as the purchasers may desire. In new buildings we shall be governed solely by the architect's specifications. If Attix wire is specified we shall use it in accordance with the Underwriters' rules; if molding or conduit is specified we shall do likewise."

Work for Contractors.

The United States Treasury Department is inviting sealed proposals until 2 P. M. May 27, for wiring the United States building at Monroe, La., the court house and post office at Erie, Pa., the custom house at Philadelphia, Pa., and the United States public building at Paducah, Ky., for a system of electric lighting. Prospective bidders can obtain specifications and blank forms of proposals by addressing the custodians of the above named buildings. Proposals should be addressed to W. E. Curtis, Acting Secretary of the Treasury, Washington, D. C.

The Brooklyn Electrical Society.

This enterprising association of young electricians held its regular weekly meeting on Tuesday evening, May 14, in the lecture room of the Brooklyn Edison Electric Light Station. Mr. Nelson W. Perry had been announced to lecture on the subject of Induction, and this opportunity was embraced of returning the compliment to the electrical section of the Brooklyn Institute which had invited the society some months since to attend one of its lectures in a body. Invitations were therefore extended to the Institute, and many of its members availed themselves of the opportunity.

After discussing the ether and illustrating by means of a water analogy how waves were set up in this medium and by their means energy was radiated into space, the lecturer showed how these ethereal waves set electricity in motion in all parallel conductors with which they came in contact just as floating particles on the surface of the water were set in motion by water waves. This, he said, was the method by which currents were set up by induction. He then illustrated a number of very useful and novel applications of the principle of the Hughes induction balance. One of these was the location of bullets in the human body. Referring to the attempt to locate Guiteau's bullet in Garfield's body, the lecturer explained how to the ignorance and bungling of Garfield's physicians was due its failure. It seems that Garfield lay upon a metallic spring mattress on a brass bedstead and the electric probe located these rather than the bullet. An infallible instrument for detecting counterfeit coins was illustrated and explained and another, which should prove of great use to aurists, by which the acuteness of hearing could be most accurately determined. Another use suggested for this instrument was to determine the relative or absolute efficiencies of telephone instruments.

Finally the lecturer showed the operation of Dr. Lodge's coherer by which etheric waves set up by an induction coil spark some twenty feet away caused the closing of an electric circuit and the ringing of a bell. This was perhaps the first public exhibition in this country of Dr. Lodge's wonderfully sensitive instrument. The lecturer paid the society a compliment that all of the apparatus used was made by one of their members, Mr. M. R. Rodrigues.

At the close of the lecture Mr. Durant showed a number of beautiful Geissler tube effects which were much appreciated by those who were fortunate enough to be present.

The Bryant Switch Company Enjoined.

Judge Shipman, in the United States Circuit Court at Hartford, has granted a temporary injunction in the suit of the Edison Electric Light Company against the Bryant Electric Company of Bridgeport. C. E. Mitchell and Richard M. Dyer, of New York, appeared for the complainant, and Howson & Howson for the defendant.

Starting of the Niagara Plant Postponed.

Secretary Rankine of the Cataract Construction Company states that no power will be delivered until the second dynamo is set up and ready for operation. This seems to mean that notwithstanding the fact that the first dynamo is now ready no power will be delivered, even to local consumers, until perhaps August 1.

Toledo Combine Perfected.

All the electric light and railway companies of Toledo, with one exception, have finally been gathered into a consolidation scheme, of which Messrs. Ream and Hale, of Chicago, are the heads. The Robinson railway system is still out. New building and bonding will begin at once.

General News.

What is Going on in the Electrical World.

Coney Island, N. Y.—At the fire on the 16th the electric light plant was totally destroyed.

Earlville, Ill.—Waterworks and an electric light plant are to be introduced here at a cost of $18,000 or $20,000.

Little Valley, N. Y.—A committee has been appointed to look into the question of electric lights for this village.

West Burlington, Iowa.—The Burlington Improvement Society proposes to establish an electric lighting and street railway plant here.

Los Angeles, Cal.—Herman de Laguna has applied to council for a franchise to build and operate an electric railway in certain streets of this city.

Marietta, Ga.—The property and rights of the Marietta Electric Light Company have been transferred by foreclosure sale to James T. Anderson, for $4,500.

Dodgeville, Wis.—The city council has decided to advertise for bids for lighting the streets by electricity, and a committee has been appointed to prepare specifications.

Kansas City, Mo.—The solicitor for the Kansas City and Independence Air Line Railroad states that the Air Line will soon change its motive power from steam to electricity.

Ansonia, Conn.—Upon an order of the court the receiver of the Ansonia Electric Company will shortly pay a second dividend of 10 per cent. to the creditors and stockholders.

Oneida, N. Y.—As the summer approaches, interest in the proposed electric railway from this city to Oneida Lake is revived, and there is now a probability that the line will be built.

Alexander City, Ala.—At a mass meeting held here recently a committee was appointed to canvass the town and ascertain if sufficient money could be raised to put in electric lights.

Flagstaff, Cal.—J. D. Moore, of the Prescott Light and Power Company, has been canvassing the town with a view to putting in an electric plant. He will apply to the council for a franchise.

Brookfield, Mass.—A franchise has been granted to the Springfield, Warren and Spencer Electric Company, giving them the right of way for their road through the principal streets of this town.

Derry, N. H.—A considerable amount of the stock of the proposed Derry and Chester electric road has been subscribed for, and it is believed that the balance will be forthcoming at an early day.

Kutztown, Pa.—At a meeting of the Allentown-Kutztown Electric Railway Company here, on the 14th, it was determined to begin work on the line as soon as possible, rights of way having been secured.

Minneapolis, Minn.—An electric railway line to Lake Minnetonka is promised by Sir Charles Gibson, of St. Louis, the owner of considerable property at the lake, if he can arrange matters to his satisfaction.

Brattleboro, Vt.—The Electric Railroad Company will begin work at once on the construction of their trolley road in this town, the company having accepted the rules and restrictions of the selectmen.

Manchester, Conn.—Charles M. Jarvis, of East Berlin, Conn., temporary receiver of the Mather Electric Company, is to be made permanent receiver by the Superior Court. The works will continue to run.

Long Branch, N. J.—The Long Branch common council has refused to grant the petition of the West End and Long Branch Railroad to change its motive power to a trolley system. Long Branch is getting slow.

Pittsburg, Pa.—Consolidation of the several traction lines in this city is considered certain within a few months, the legal difficulties in the way of such a combination having been removed by recent legislation at Harrisburg.

Boston, Mass.—The bill to authorize persons or corporations, except a railway, engaged in the business of transmiting electricity for lighting or power to sell electricity for heating and cooking purposes has passed the House.

Charlottesville, Va.—The Piedmont Improvement and Construction Company have secured right of way for their electric car line through the grounds of the University of Virginia. It is expected that the line will be in operation by the middle of June.

Greensboro, N. C.—An ordinance has been prepared at the instance of the board of aldermen in regard to holding an election to ascertain the will of the citizens on the question of issuing bonds for the erection of an electric light plant by this city.

Monroe, La.—A number of business men of this city have applied to council for a franchise to build an electric railway to connect Monroe with the site of a new town laid out by the Pasqoud Land Improvement Company, about six miles distant.

Glen Cove, N. Y.—The Franklin Illuminating Company is erecting a 100 horse-power engine, to be used in furnishing light and power to Glen Cove. The monocyclic system will be used and a dynamo large enough to light 1 000 lights will be placed in the building.

Meridian, Miss.—S. H. Gehlman, of Springfield, Ill., and L. B. Bradley, of Peoria, Ill., have been awarded the contract for erecting an electric plant and to furnish the city with seventy-five arc lights at $800 per month, and also the contract for an electric railway.

Portland, Conn.—It is reported here that the Portland Electric Railway Company will begin shortly the construction of a road from the Portland dock to Glastonbury to connect there with the Hartford electric road. The road will be completed by the 1st of October and will be six miles in length.

Mitchell, S. D.—The plant and franchises of the Mitchell Electric Light Company have been sold by the owners to M. B. Cleminger of this city, the price paid being $15,000. The company held a twenty years' franchise and also a contract for lighting the city at $140 per month for the same length of time.

Elk Point, S. D.—C. A. Potter, of the firm of M. B. Potter & Company of New York, has proposed to this city that if it will grant a 50-year franchise and will agree to pay for a certain number of arc lights, they will put in an electric and waterworks plant to cost $30,000. The proposition will probably be accepted.

Baltimore, Md.—The Maryland Electric Company have under consideration the erection of new electric light plants in this city and are in consultation with the Fort Wayne Corporation about the equipment. The Fort Wayne Company has since its incorporation erected sixteen such stations as is contemplated in Baltimore.

Commerce, Tex.—Imboden & Canto, of Fort Worth, have made a proposition to the citizens of Commerce to put in a $30,000 cotton seed oil mill and electric light plant, they to take one-half of the stock and the citizens one-half, the same to be in operation for the fall crop. A committee was appointed to secure the required stock.

New Haven, Conn.—The Fair Haven and Westville Railroad Company has completed the purchase of the charter of the New Haven and North Haven Electric Street Railroad Company. A large tract of wooded land at the terminus of the proposed road in Montowese has been purchased by the company and it will be fitted up as a picnic ground.

Orlando, Fla.—A party under A. L. Hunt, have made a preliminary survey of the proposed route for an electric railway between Sanford and Orlando. There is said to be sufficient financial backing to the enterprise to insure the prompt construction of the road. G. W. Henck, of Longwood, Fla., is the general agent for the non-resident capitalists.

Elyria, O.—Ex-Congressman Tom L. Johnson is the authority given for the statement that an electric railway, to be the fastest in the world, will be built from his steel plant near this city to Cleveland, twenty five miles. The road is to be constructed with a view to obtaining the greatest possible speed, and it is expected that the distance will be covered in thirty-five minutes.

Hempstead, N. Y.—A New York electrical engineer has been visiting this place with a view of purchasing the plant of the Ball Electric Light Company for some New Jersey capitalists who propose to establish an electric railway in the county and utilize the plant in furnishing power for the railway as well as light for the village.

Vicksburg, Miss.—The city council has reconsidered its previous action awarding the contract for lighting the city to the Vicksburg Electric Light Company, and rescinded it. It is likely that an amicable arrangement will be effected, and that the company will get the contract on a moonlight instead of an all-night schedule.

Salt Lake City, Utah.—A new electric light plant is to be put in here by Messrs. Boettcher and Hunter, to utilize the rights and franchises of the Citizens' Electric Light Company. A site for the necessary buildings has been purchased, and a contract has been entered into with Henry A. Roemisch for the construction of the power house, etc.

Alton, Ill.—It is understood that the Alton and Upper Alton Street Railroad and Carrying Company and the Middletown Street Railroad Company are to be consolidated as one company under the former name, Wm. Eliot Smith to be the principal stockholder. The Middletown street and Second street car lines, now operated by motor and horse power, are to be changed to electric lines.

Clinton, N. Y.—Prof A. G. Benedict, of Houghton Seminary, was chairman of a meeting held here a few evenings since for the purpose of getting an expression of opinion relating to the building of an electric road from Clinton to Utica. The meeting was unanimous in favor of the project and committees were appointed to procure information, subscriptions and rights of way.

Niagara Falls, N. Y.—The Cataract Construction Company has men at work beautifying the grounds around the great power-house, while inside the building the second big dynamo is being set up, and the switchboard and other electrical apparatus put in place. It is thought that the company will be able to furnish power to outsiders by the last of July.

Montclair, N. J.—The newly incorporated Electric Light and Power Company of Montclair does not intend to ask for a franchise to light the streets this year, but the main object is to supply light and power to residences and stores. It will, however, put in a plant to supply arc as well as incandescent light, so as to be able to light the streets at some future time.

Cleveland, O.—The Walker Manufacturing Company is building two electric generators of 1,000 H. P. each and two of 500 H. P. each for H. A. Everett's street railroad in Detroit. The company has about thirty generators under construction aggregating 15,000 H. P., and is turning out six motors daily for the Chicago City Railway Company. The works are in operation night and day.

Waco, Tex.—Judge Goodrich has approved the sale of the Waco Electric Railway and Light Company's property to President Henry C. Scott of the Citizens' Street Railway, and the entire street-car system of Waco will now be conducted under his management. The light plant of the sold-out company has been purchased from Mr. Scott by the Waco Gas Company.

Hagerstown, Md.—Mr. Powell Evans, representing a Philadelphia syndicate, has been granted permission to erect poles and string wires along the roads of the county and the streets of Hagerstown for the purpose of conducting and supplying electrical power for all purposes, the power to be obtained from dam No. 4. or dam No. 5 on the Potomac river. Mr. Evans says the power at dam No. 5, where there is a heavy fall, is equal to 3,000 H. P.

Richmond, Va.—The council committee on streets have decided to recommend the Jenkins underground electric system for the Broad street car line, and suggest that the line be extended from its present terminus to the Exposition Grounds and to Chimborazo Park.—A resolution has passed the council appropriating $500 for the purpose of having plans and specifications drawn for an electric light plant of 600 arc-light capacity.

Reading, Pa.—A resolution of councils passed a few days ago requires the appointment of a committee "to inquire into the light question and communicate with electrical construction and other light companies with a view of ascertaining what the cost of construction and outfit of a plant would be and as to the feasibility of the city constructing its own light plant, and such other and necessary information as the facts of the case may warrant and require."

Wabash, Ind.—Capitalists in the Indiana oil belt are after a franchise to build an electric line from Bluffton to Camden, using the right of way of the Cincinnati, Union and Chicago Railroad which was abandoned last winter. The length of the proposed road is eighteen miles, and it is the intention of the projectors to lay out a park, construct a large lake and make an attractive pleasure resort six miles from Bluffton.

Kokomo, Ind.—Capitalists of this place have secured a franchise and right of way for an electric line from Kokomo to Greentown, to be constructed this summer. It is the purpose of the company to extend the system to Sycamore, West Liberty and other towns, and to connect with the projected electric lines in Grant, Delaware and Madison Counties. When these are completed the Indiana gas belt will be a network of electric railways.

Camden, N. J.—At the annual meeting of the directors of the Camden, Gloucester and Woodbury Electric Railway, held recently, the following officers were elected for the year: President, J. Willard Morgan; secretary, Thomas P. Curley; treasurer, William J. Thompson. Directors: Henry J. West, George H. Barker, Abram Townsend, David Baird, Gustavus S. Muller, Thomas P. Curley, J. W. Morgan, Henry M. Harley and W. J. Thompson.

Atlanta, Ga.—The Electrical Building is the first of the Exposition Buildings to be completed. It is considered a very pretty building and spacious enough to contain all the exhibits that are likely to be sent.—The South is evidently endeavoring to "keep up with the procession," and Atlanta never drops far from the music. The Atlanta Consolidated Street Railway Company has lately added to its rolling stock several elegantly constructed cars for the accommodation of "trolley parties" and picnickers.

Chicago.—The Western Electric Company has been granted a permit to erect an eight-story and a two-story brick building at 242 to 258 Jefferson street. They are to be used as a factory, offices and blacksmith shop and will cover an area of 180 by 49 feet and 50 by 50 feet, the latter being the two story building used as the blacksmith shop. The total cost will be $140,000. The same company also secured a permit to build two additional stories on their factory at 37 and 39 West Congress street.

Norfolk, Va.—Electrical equipment is to displace steam power on the Norfolk and Ocean View Railroad. The road connects Norfolk with Ocean View, a seaside resort twelve miles distant, and it has been operated by steam for over fifteen years, making connections with the Seaboard Air Line, Norfolk and Western and other roads touching at Norfolk. Forty-foot cars with 100 horse power motors are to be employed, with three or four trailers, practically making a trolley train. The road handles considerable freight.

Vancouver, B. C.—F. S. Barnard, M. P., manager of the Consolidated Railway and Light Company, has made a proposition to the New Westminster city council to the effect that if a bonus be given to him by the city he will put up a new generating plant on Seymour Creek where water power is obtainable, and supply electric light to the city at 25 per cent. less than it is at present paying and also furnish power for the Vancouver and Westminster electric railway lines.

New Brunswick, N. J.—The new owners of the City Railway, the Kreuger-Radel syndicate, have organized by electing the following officers: President, Judge Gottfried Kreuger; vice-president, John Radel; secretary and treasurer, Edward Radel. The company will change the horse car line into an electric railway, and intends after a franchise is granted to run its tracks from New Brunswick to Milltown, South River and South Amboy.

New York.—The Edison Electric Illuminating Company of New York reports for April: Gross earnings, $129,277; increase, $13,066. Operating expenses, $60,876; increase, $10.915. Net earnings, $68,401; increase, $2,152. Other income, $3,802. Total, $72.203; increase, $5,954. January 1 to April 30: Gross earnings, $570,225; increase, $82,167. Operating expenses, $267,954; increase, $56,271. Net earnings, $302,271; increase, $25,996. Other income, $22,044. Total, $324,315; increase, $48,040.

Portland, Ore.—The General Electric Company has begun a suit here against the receiver of the O. R. and N. Company, to recover $63,016.43 for the loss of nine carloads of electrical machinery destroyed by fire at Albina. Judgment is asked for the value of the damaged goods at the factory at Lynn, Mass., for freight paid on the damaged goods from Lynn, Mass., to Portland, for freight paid on reshipment of certain of the machinery to the factory in order to have the destroyed parts rebuilt, and for damages for six months' delay in completing the electric-power plant.

Harrisburg, Pa.—The East Harrisburg Passenger Railway Company and the Citizens' Company are to be consolidated under the title of the Harrisburg Traction Company, and will be operated after June 1 under one management. The new company will have a capital of $1,500,000, of which $1,240,000 is divided among the East Harrisburg stockholders and the remaining $260,000 among the Citizens' stockholders. The company will control all of the tracks that are at present in use here, and will make extensive improvements.

Shelbyville, Ind.—B. S. Sutton, of this city, A. A. Hackman, of Oldenburg, and John Hildebrand, of Batesville, have organized the Batesville and Oldenburg Steam and Electric Railway Company, which starts with a capital stock of $100,000. The projectors have obtained the right of way from the Batesville and Oldenburg Turnpike Company, and will build an electric line between the two towns. The company expects to extend the line during the summer to Osgood and then to Versailles, and later from Oldenburg to Brookville. A power house will be built at Batesville, and later one at Osgood.

Cincinnati, O.—The annual union meeting of the Brush Electric Company, the First Cincinnati Electric Illuminating Company, and the Heuss Electric Company, was held here on the 8th inst. The following officers were elected to serve for the three companies; A. Hickenlooper, president; C. F. Hesser, vice president; Charles J. Foust, treasurer and assistant secretary; Harold Ryland secretary and assistant treasurer.—The Cincinnati, Middletown and Dayton Street Railroad Company is busily engaged in getting consents for the proposed line through to Dayton. The line as surveyed will go by way of Paddock Road to Carthage, O.

Rochester, N. Y.—Proposals will be received at the office of J. Foster Warner, architect, 1,036 Granite Building, Rochester, for all the work and materials required for interior finishing of a fireproof court house for the county of Monroe, in the city of Rochester, N. Y. Each bid must be in gross for the whole work, which includes plastering, papier mache, marble work, carpenter work, plumbing, elevator enclosures, stairs, skylights, electric lighting, wires, etc. Each bid must be accompanied by a certified check for $10,000. The right is reserved to reject any or all bids.

Wiscasset, Me.—The Maine Water and Electric Power Company have a scheme in hand which, if carried out, will have an important bearing on the prosperity of this locality. The plan is to acquire the water power on the Sheepscot River between Cooper's Mills and Wiscasset. These powers the company proposes to improve by the erection of dams and the construction of canals, etc. Then they hope to induce manufacturers to locate along the river and use the power. Several manufacturing concerns in other States are understood to be examining the location of the company's proposed works with a view to erecting mills. The prime movers in this enterprise are Pennsylvania men, and associated with them are Henry Ingalls of Wiscasset and Dr. Card of Alma.

Santa Fe, N. M.—The Santa Fe and Cochiti Railway Company and the Rio Grande Electric Power and Irrigation Company have filed articles of incorporation here. The two companies are practically one corporation. One feature of the plan of the promoters is the construction of a railway and telegraph or telephone line from Santa Fe westward by the most feasible route to a point on the eastern bank of the Rio Grande nearly opposite to the mouth of the Canon de Cochiti, and thence, crossing the river and continuing in a westerly direction, to Allerton and up Pino Canon to Bland, which is located at the very heart of the Cochiti mining district. The distance from Santa Fe to the river is about twenty miles and from the river to Bland is about fifteen miles. Another feature is the building of dams on the river at White Rock Canon and the utilization of the great water power obtainable in the generation of electricity. Among the incorporators are Alexander H. Handlan, jr., and Thomas W. Murray, of St. Louis; Levi Ellis, of New York; James H. Purdy, a well known local attorney, and Herman Claussen, proprietor of the Palace Hotel, Santa Fe.

Telephone and Telegraph.

Wires are being put up for a new telephone system in Demopolis, Ala.

Most of the $5,000 capital stock of the Wayne County Telephone Company, of Clyde, N. Y., has been subscribed.

The Electric Railway Company at Leavenworth, Kan., is stringing wires for a telephone system in connection with its street car line.

The attempt in the Select Council at Philadelphia to repeal the ordinance granting a franchise to the Mutual Automatic Telephone Company failed—for repeal, 7; against, 21.

The International Bell Telephone Company (limited) has filed with the Secretary of State at Albany a certificate of reduction of capital stock from $1,700,000 to $1,000,000.

A local telephone company has been organized at Sacramento, Cal., to compete with the Sunset Company, a Bell concern. The new company has asked the council for a franchise.

The Westchester Telephone Company, Yonkers, N. Y., has reduced its rates and adopted a graded system by which charges are based upon the amount of use or number of calls made.

Moved to action by the fact that a rival company has obtained a franchise to build a line in Rahway, N. J., the New York and New Jersey Telephone Company is entirely renewing its system in that town and substituting cables instead of the ordinary wire.

The Trinity Church corporation has extended the lease granted to John W. Mackay for the ground on which the Postal Telegraph Building, cor. Broadway and Murray street, New York, was provisionally erected, twenty years at an annual rental of $52,500.

The Northwestern Telephone and Construction Company have begun work in Osage, Iowa, erecting poles and wiring the place for a system of telephones. Connection will be made with Charles City and Mason City and with nearly every town in the county.

The Chester Mutual Telephone Exchange of Chester, Ill., has been organized with Dr. William A. James as president; E. W. Abrams, vice-president; Louis Heltman, secretary and treasurer. Contracts have been let for the erection of the system, to be completed by July 15.

The Co-operative Telephone Association of Shreveport, La., has contracted with the Brown Electric and Machinery Company of Little Rock, Ark., for a plant and central office, with equipments for 359 telephones, including the erection of the line and its connections at all points in the city.

A telephone system is being put in in the Temple at Boston to enable those in the lower temple and Temple College, at the overflow meetings, to hear the pastor's voice simultaneously with the delivery of the sermon in the Temple proper. Tests already made indicate that the system will be a success.

The Crookstown Telephone Company of Crookstown, Minn., has arranged to extend its line to Fisher, Mallory and Grand Forks. It is the intention of the company to ultimately extend its system to the towns upon the Fosston extension and connect with those along the Thief River Falls and at St. Vincent.

The Detroit Telephone Company, incorporated at Detroit, Minn., has elected officers as follows: President, T. A. Nottage; secretary, J. K. West; treasurer, J. E. Furber; trustees, W. E. Reed, E. McNeil and C. K. Day. The company will put in and operate a telephone system between Detroit and Lake Melissa and probably extend the line to Fargo, N. D.

The Wizard Telephone Company has asked the city council of Council Bluffs, Iowa, for the right to establish a telephone system in that city, but the ordinance prepared by the council is so restrictive that the company is not likely to accept it. The ordinance stipulates that the company "put its wires in alleys wherever practical" and "underground whenever ordered by the council," and limits the term of the franchise to ten years.

The telephone system to Morgantown, W. Va., has been completed, putting in communication with one another the towns of Morgantown, Fairmont, Grafton, Clarksburg, Parkersburg, W. Va., and Uniontown, Pa. It is the intention of the company to extend the system to Pittsburg, and include all the towns along the Fairmont, Morgantown and Pittsburg Railroad. It will also reach the remaining towns in Central and Western West Virginia.

The Harrison Telephone Company of Owensboro', Ky., has filed articles of incorporation. Its capital stock is $20,000. Capital is furnished by the following local people: R. Monarch, J. R. Lancaster, J. H. Parrish, Z. T. Robinson, Lawson Reno, J. W. Carter, J. D. Powers, E.H. Luckett and Wilfred Carico. The new company will have a rate of $30 per year for business houses and $18 for residences. The cut will be met by the Bell Company.

At the annual meeting of the stockholders of the Rochester District Telegraph Company at Rochester, N. Y., directors and officers were elected as follows: President, S. B. Gifford; vice-president. C. A. Tinker; secretary and treasurer, G. D. Butler. The remaining directors are: A. Erickson Perkins, J. C. Kalbfleisch, T. Barnard and G. V. B. Frost. It was reported that the messengers of the company are being equipped with bicycles for the purpose of expediting the service.

The Drawbaugh Telephone Company, which is asking permission to construct a telephone system in Philadelphia, was incorporated in 1893, with a capital of $2,000,000. The management is composed of J. F. Stokes, president; Charles A. Gladding, secretary; John D. Ford, treasurer; Brinton N. Newcomb, general manager; Samuel L. Kent and William O. Hempstead. The ordinance granting the company the right to establish its system has just been ordered by councils' electrical committee to be reported to councils with a favorable recommendation.

The Mutual Automatic Telephone Company is getting a large number of subscribers in Buffalo, N. Y. Its contract with applicants gives a rate of $36 a year for business places and $30 for residences, and one of the principal conditions is that the contract "shall not be binding upon the subscriber until 2,000 subscribers shall have been obtained, nor until the right to erect and maintain the company's wires in the city of Buffalo shall have been granted by the municipal authorities and accepted by the company, nor shall this contract be binding unless said company or its assigns commence to lay its wires and make substantial progress within six months after said grant."

The stockholders of the Baxter Overland Telephone and Telegraph Company held their annual meeting at Utica, N. Y., last week and elected officers as follows: President, C. W. Mather; vice-president, J. B. Turnbull; secretary, A. W. Mills; treasurer, T. J. Griffiths. Executive Committee: Louis Friede, S. Mansbach and Counteil Munson. Directors: C. W. Mather, J. B. Turnbull, Benjamin D. Gilbert, Clayville; Palmer M. Wood, Herkimer; T. Jay Griffiths, A. W. Mills, M. O. Terry, Louis Friede, Countcil Munson, S. Mansbach and Chas. L. Sharp. A committee was appointed to confer with an electrical expert and procure estimates as to the probable cost of placing the plant of the company in operating order.

The company recently incorporated at Madison, Wis., to be known as the Standard Telephone and Electric Company, will use the "Milde" long-distance microphone, which has been adopted by the French houses of Parliament, the Admiralty and War Offices, Post-office and Telegraph department, the Paris telephone exchange, railway companies, public institutions, etc., also by the British, Italian, Spanish and South American Governments, the Norwich Telephone Company, the telephone companies of Italy and Egypt, and generally by the railroads, corporations, collieries, etc., throughout France and England. One of the features of the "Milde" telephone is that it is both long and short distance, needing no regulation. The new company has absorbed the Standard Telephone and Electric Company of Minneapolis, Minn., which has been making the French telephones in this country for about five months, and will remove the plant to Madison. The officers of the new company are: President. P. L. Spooner, Madison; vice-president, B. B. Clarke, Madison; secretary, E. W. Batchelder, Minneapolis; treasurer, R. M. Lamp, Madison; electrician, H. C. Dodge, Minneapolis.

COMMERCIAL PARAGRAPHS.

It is always well to have a rule to go by. Warren & Lozier, the electrical repairmen of 465 Greenwich street, New York, think so and have been supplying their friends in the trade with a useful one. It is 12 inches long and bears legends that call to mind what the donors are here for.

The Manhattan Electrical Supply Company, 32 Cortlandt street, New York, have issued an elaborate and handsomely illustrated catalogue descriptive of the complete lines of electrical supplies handled by them.

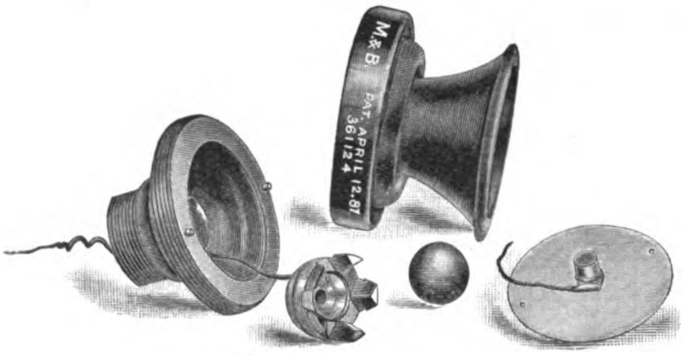
Eugene Munsell & Co., 218 Water street, New York, miners, importers and wholesale dealers in electrical Mica, are issuing, from time to time, descriptive and up-to-date lists of their products. This company procures all its supplies direct from the mines and in dealing with buyers reaches first hands, and not middlemen.

The C. W. Hunt Company, 45 Broadway, New York, the leading manufacturers of industrial railways, have issued an illustrated catalogue that should be in the hands of every power station manager in the country.

The Metropolitan Electric Company, 186-188 Fifth avenue, Chicago, are advising their customers and the trade generally that while they are willing to meet competitive prices on high-grade rubber wire, the National India Rubber Company, manufacturers of N. I. R. Wire, will not enter competition upon the low grade of cheaper wires that have been foisted on the market. They prefer to keep up the high standard of this wire, feeling that in the long run it will be to the advantage of the business at large and the wire trade in particular.

The M. & B. Transmitters.

The M. & B. Transmitter is not a Blake, not a Hunning, not a granular carbon (solid back), and in fact, not like any other ordinary type; but it is claimed to be the most simple, perfect and reliable transmitter possible to construct. The accompanying cut shows the transmitter dismantled. The diaphragm is of India mica, a highly resonant material which gives great efficiency. Attached to the center of this diaphragm is a small aluminum cup holding a carbon or other suitable point. In front of the black rubber shell is shown the basket or runway of aluminum or metal. The sphere shown in the cut may be of carbon or other material, which normally lays in the basket or runway, which is so constructed that no matter which side of the transmitter is up the sphere rests on a plane that is always inclined towards the diaphragm. When these parts are assembled the point on the diaphragm comes about on a level with the center of the sphere, which, owing to the angle of the side of the basket or runway, is kept against this point by gravity. With every oscillation of the diaphragm a movement of this sphere takes place which breaks the battery current, hence the name "Make and Break" and the well-known sign "M. & B."



M. & B. TRANSMITTER.

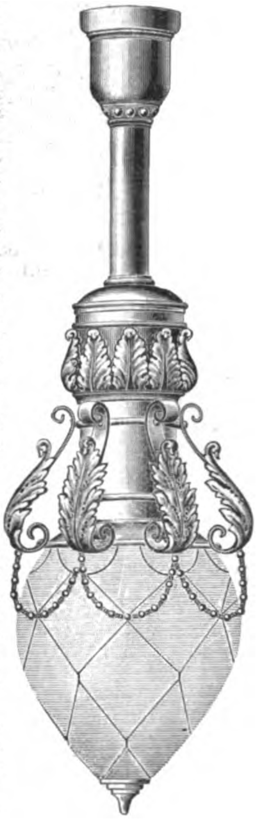
It will be readily seen that the M. & B. Transmitter is indeed novel in every detail, that the electrodes are not in constant contact, and that by it an intermittent or pulsatory current is produced instead of the undulating or vibratory as is used by the ordinary form of transmitter. The M. & B. principle is set forth in the first claim of the broad method patent No. 361,124 under which these transmitters are constructed. The claim reads:

"The art or method of transmitting vocal or other sounds telephonically by causing intermittent or pulsatory currents of a uniform volume or intensity, and of durations corresponding to the phases of the oscillation of the diaphragm."

The practical results obtained by this form of transmitter, which shows its superiority over other kinds, are: 1st, Articulation, which is claimed to be better and more perfect. Every syllable, whether a shout or a whisper, is transmitted clearly and distinctly. There is no running together of words nor confusion of sounds; 2d, Volume. While the volume of sound is great, yet there is no sputtering, snapping or "frying" sound, which is so annoying in some well-known transmitters; 3d, Long Distance Transmission. Every M. & B. Transmitter is a long-distance instrument; 4th, Simplicity of Construction. There is nothing to get out of order; no adjustments to be made; no springs to give out; no "packing," and no plastic material to change in density. In fact, it is claimed the M. & B. can never get out of order or wear out. This means a great saving to exchange managers, and to private users it means still more, as they often have no one who could adjust or patch up their telephone when they get in "trouble."

The United States Telephone Construction Company of Philadelphia, who control the M. & B. Transmitter, invite competitive tests as to all their points of superiority. These transmitters are covered by over ten construction patents, with others pending, besides the broad method patent mentioned before and issued April 12, 1895, so that users of these instruments are perfectly safe from any fear of suits on patent questions.

Arc Lamps and Fixtures.



The accompanying illustration shows but one of the great variety of styles of Arc Lamps for constant potential circuits made by the General Incandescent Arc Light Co. R. B. Corey, general sales agent of this company, has compiled an elaborate and attractive catalogue, embracing illustrated descriptions of lamps, ornamental brackets, pole fixtures and other accessories.

The accompanying illustration shows an ornamental type of rack rod lamp for 100 to 220 volt direct current circuits. It is similar in style and finish to the lamps made for alternating current circuits. These lamps are made in either short, regular or long lengths, and pass 6, 8 and 10 amperes and burn 7, 11 and 14 hours respectively.

Interior arc lighting has assumed such proportions that the necessity for lamp brackets of ornamental design has long been apparent. The catalogue in question devotes considerable space to the illustration of a variety of brackets of both plain and ornamental designs.

These brackets are made of wrought iron and are as well adapted for outdoor service as interior lighting.

The street lamp pole fixtures are made of wrought iron pipe with cast cross-pieces, strength and durability being the chief points sought in their construction.

Manhattan General Construction Company.

The Manhattan General Construction Company have moved their offices from 50 Broadway to the Edison Building, 44 Broad street, New York.

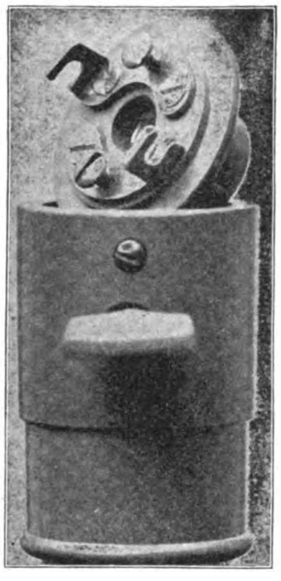
A Non-Conducting Socket.

In interior wiring electricians have long felt the need of a lamp socket made of non-conducting material. Several such sockets have been designed, but in their manufacture no effort has seemingly been made to produce an article that will harmonize in dimensions or finish with the elaborate and artistic electric lighting fixtures now so largely used.

In the Non-conducting Socket, shown in the accompanying engraving, tastefulness of design has not been made subordinate to the other and marked advantages the socket possesses. The socket shell is made wholly of hard rubber, highly polished. It consists of two parts. The base has attached to it two brass ears to which the terminals of the conductors are fastened by binding screws.

The ears have projections which, when the cap is in place, engage with lugs in the body of the socket. None of the conducting parts are exposed to contact with external objects. The shell being of non-conducting material, it is impossible for a short circuit from one conductor to the shell to take place, as is a common occurrence with brass shell sockets.

The simplicity of wiring the socket will certainly commend it to wiremen. By removing the base the process of wiring is reduced to the simple operation of placing the conductors under the binding screws and fastening them down with a screwdriver.



NON-CONDUCTING SOCKET.

The socket is suitable for use in all classes of interior or exposed work. It is made in all finishes such as brass, silver, oxidized, etc., to harmonize with fixtures, to which it is attached in the same manner as brass sockets. The socket is the invention of Charles H. Balsley, of Connellsville, Pa., and is made and sold by Balsley & Bryner of that place.

MOONLIGHT SCHEDULE FOR THE UNITED STATES.

(Issued by the Washington Carbon Company.)

MAY, 1895.

INCORPORATIONS.

The Wood County Telephone Company, at Grand Rapids, Wis. Capital stock, $5,000. Incorporators: John A. Gaynor, H. H. Voss and George L. Williams.

The Bissell, Dodge and Erner Company, Toledo, Ohio—to manufacture, repair and deal in all kinds of electrical and other machinery, tools, equipments, etc., also build, contract and construct all kinds of electrical and other mechanical plants, etc. Capital stock, $25,000. Promoters: Fred'k Bissell, Fred'k H. Dodge, Jno. A. Erner, A. W. Scott, G. G. Kelp.

The Cable Insulator Company, Saco, Maine—to manufacture and deal in insulators and electric appliances of all kinds. Capital stock, $10,000. Promoters: Samuel Oakman, Wingate P. Sargent, Melrose, Mass.; Jas. R. Powers, Boston Mass.

The William's Bridge Gas and Electric Light Company—to manufacture and use electricity for producing light, heat or power in the village of William's Bridge, Westchester County, N. Y. Capital stock, $30,000. Directors: Charles H. Royce, William L. Johnson, James Thatcher, Franklin Paddock, of New York City; and J. F. Tracy, of Larchmont, N. J.

The Citizens' Telephone Company—to operate telephone lines in Marion, Bartholomew, Jackson and Johnson Counties, Indiana. Capital stock, $15,000. Directors: Andrew E. Reynolds and Carl L. Rost, of Crawfordsville, and George W. Caldwell, of Columbus, Ind.

The Tacoma, Burnt Mills and Sandy Springs Railway Company, of Montgomery County, Md.—to construct and operate an electric railway from near the District line in Montgomery County to Ellicott City by way of Sandy Springs. Capital stock, $100,000. Incorporators: J. B. Colegrove, M. F. Sliney, Allen Freas, F. Ray Keys and B. H. Colegrove.

The Topeka Electric Railway Company, Topeka, Kan.—to construct and maintain railway from Topeka to Rossville, street railways, etc. Capital stock, $75,000. Promoters: A. J. Arnold, T. M. James, Louis Stair, Francis C. Downey, Topeka.

The La Salle Construction Company, Chicago, Ill.—to construct railroads or tramways to be operated by steam, electricity or other motive power, etc. Capital stock, $100,000. Promoters: W. E. McClurg, C. H. Bumstead F. S. Donnell.

The Greenville Electric Light, Heat and Power Company, Greenville, Ill.—to erect, construct and maintain an electric plant for the generation, transmission and sale of electricity for light, heat, power, telephone and all other purposes. Capital stock, $25,000. Promoters: Ernest C. Bruckman, Samuel E. Bruckman, Alice H. Bruckman.

The People's Telephone Company, Haverhill, Mass.—to transmit intelligence by electricity and deal in telephone instruments, etc. Capital stock, $1,000. Promoters: Edw. H. Hoyt, Philip C. Sweet, Franklin Woodman.

The Montclair Light and Power Company, Montclair, N. J.—to construct, maintain and operate an electric light and power plant in Montclair, N. J. Capital stock, $50,000. Promoters: Geo. F. Baker, Chas. C. Coe, New York, N. Y.; W. G. Snow, Chas. D. Backus, Montclair, N. J.

The Inter-Urban Rapid Transit Company Tiffin, Ohio—to construct, acquire and operate street railway or railways in and between the cities of Tiffin and Fostoria, Ohio, electric, steam, cable, horse, or other motive power to be used in operating. Capital stock, $250,000. Promoters: Meshech Frost, Amandus Betts, Norman McCarty, Lewis Selle, W. F. Noble.

The City and Prospect Heights Street Railway Company, Peoria, Ill.—to construct, maintain and operate a street railway by horse, dummy, or electricit . Capital stock, $150,000. Promoters: Wm. S. Turner, Chas. Edwards-Woodbridge, Jno. C. White

The McKeesport and West Newton Passenger Railway Company, McKeesport, Pa.—to build a passenger railway operated by electricity in Westmoreland County, Pa. Capital stock, $60,000. Promoters: Homer H. Swaney, Jos. R. Henderson, F. W. Patterson, McKeesport.

The Citizens' Railway Company, Denver, Col.—to build and operate electric railway lines connecting Denver with other towns in Jefferson and Boulder Counties, Col. Capital stock, $500,000. Promoters: Milo A. Smith, Chas. E. Hawver, E. S. Smith, Clarence M. Cobb, Thos. W. Porter, all of Denver.

The La Crosse, Black River Falls and Millsville Electric Railway Company, La Crosse, Wis.—to build an electric road from La Crosse to Millsville. Capital stock, $300,000. Promoters: N. Clark, P. McHugh, Wm. H. Polleys, T. J. McHugh, Wm. Burns, La Crosse.

The American Union Telephone Company (incorporated in W. Va.), New York, N. Y.—to lease and dispose of telephones, telephone switches, electrical appliances, etc. Capital stock, $5,000,000. Promoters: Michael P. O'Connor and John A. Wallace, New York City; Franklin Noble, Brooklyn, N. Y.

The National Electrotype Company, Chicago. Capital stock, $5,000. Incorporators: C. J. W. Harders, Albert E. Flig, Rudolph Morstadt.

The Automatic Long-Distance Telephone Company, Chicago. Capital stock, $5,000,000. Incorporators; Cleveland F. Dunderdale, John F. Pershing and Stephen W. Groesbeck.

The Delany Heater and Rheostat Company of New York City—to manufacture and deal in all kinds of machinery. Capital stock, $100,000. Directors: J. R. Steers, J. M. Delany and E. T. Birdsall, of New York City.

The Naugatuck (Conn.) Electric Light Company has increased its capital from $30,000 to $50,000.

The Shelby Electric Railway Company, Shelby, Ohio—to construct and operate a line of railway, electric, steam or other motive power, in and between Shelby, Annapolis and Olivesburg, in Richland and Crawford Counties, Ohio. Capital stock, $10,000. Promoters: S. S. Bloom, Albert Moore, C. S. Holbrook.

The Ticonderoga Telephone Company—to maintain and operate a line of telephone from Addison Junction to Rogers Rock Hotel, Strent Road, Crown Point, Port Henry, Chilson, Schroon Lake, Whitehall, Hague, Bolton, Caldwell and Olena Falls. Capital stock, $5,000. Directors: W. W. D. Jeffers, W. I. Higgins, C. B. Bascom, R. C. Bascom, E. J. Owen, F. L. Brust, A. H. Weed, C. H. Delano and F. W. Hyde, all of Ticonderoga, Essex County, New York.

The Stromberg-Carlson Telephone Manufacturing Company, Chicago, Ill.—to manufacture and sell electrical and mechanical apparatus and appliances, and to construct telephone exchanges. Capital stock, $50,000. Promoters; Alfred Stromberg, Androv Carlson, Arthur B. Cotton.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MAY 14, 1895

ELECTRIC RAILROADS AND APPLIANCES.

539,184. Closed-Conduit Electric Railway. Paul Lucas, Berlin, Germany. Filed June 23, 1894.

539,242. Car-Wheel for Electric Cars, etc. Charles Thompson, Oswego Falls, assignor of one-half to George J. Emeny, Fulton, N. Y. Filed Nov. 22, 1894.

ELECTRIC LIGHTS AND APPLIANCES.

539,150. Electric Lamp. William H. Sheppard, New York, N. Y. Filed Nov. 20, 1894.

539,365. Electric-Arc-Lamp Clutch. William B. Luce, Brookline, Mass., assignor to E. S. Ritchie & Sons, same place. Filed March 15, 1894.

539,392. Arc Lamp. Charles A. Pfluger, Chicago, Ill., assignor to the Standard Electric Company, same place. Filed April 5, 1894.

539,393. Electric-Arc Lamp. Charles A. Pfluger, Chicago, Ill., assignor to the Standard Electric Company, same place. Filed July 2, 1894.

DYNAMO ELECTRIC MACHINERY.

539,022. Method of and Means for Assembling Commutator-Segments. Asa F. Batchelder, Schenectady, N. Y. Filed Feb. 28, 1895.

539,032. Carbon-Brush Holder for Dynamos. Winfield S. Bosley, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Sept. 8, 1894.

539,277. Electric Motor. John C. Lincoln, Rochester, N. Y., assignor to L. S. Graves & Son, same place. Filed Jan. 16, 1892.

539,293. Controller for Electric Motors. Horace F. Parshall and John W. Darley, Jr., Lynn, Mass., assignors to the General Electric Company, of New York. Filed Feb. 11, 1893.

539,369. Means for Effecting Synchronism. James H. Rogers, Washington, D. C., assignor to the Visual Synchronism Company of West Virginia. Filed Dec. 29, 1888.

539,376. Starting-Box for Electric Motors. Donald M. Bliss, Boston, Mass., assignor to the Holtzer-Cabot Electric Company, same place. Filed Feb. 20, 1895.

TELEPHONE AND TELEGRAPH APPARATUS.

539,068. Telephone. Morris Martin, Malden, Mass. Filed Nov. 10, 1886.

539,086. Telephone-Transmitter. Robert F. Rice, Hartford, Conn., assignor to Francis H. Richards, same place. Filed May 18, 1893.

539,142. Telephone Circuit and Apparatus. Charles W McDaniel, Kansas City, Mo. Filed March 16, 1895.

539,163. Telephone-Transmitter. Alfred C. Brown, London, England, assignor of one-half to George Richard Neilson, same place. Filed Sept. 27, 1894.

539,170. Magneto-Call Apparatus. Frank B. Cook, Chicago, Ill., assignor to the American Bell Telephone Company, Boston, Mass. Filed Dec. 26, 1894.

539,274. Mounting for Telephones. Thomas Kelly, Philadelphia, Pa. Filed Sept. 8, 1894.

SIGNALS AND SIGNALING APPARATUS.

539,154. Railway Signal System. George L. Thomas, Brooklyn, assignor to the Hasell Perfected Railway Signal Company, New York, N. Y. Filed Jan. 26, 1895.

539,298. Communicating, Signaling, etc., to or from Movable Objects. Joseph Y. Porter, Cleveland, Ohio, assignor to J. W. Morrison, Detroit, Mich. Filed Feb. 14, 1894.

539,354. Signaling System. John P. Coleman, Swissvale, Pa., assignor to the Union Switch and Signal Company, same place. Filed Aug. 26, 1893.

539,381. Apparatus for Indicating and Signaling Speed of Vehicles. John W. Darley, Jr., Baltimore, Md., assignor of one-half to Michael Holzman, Philip Hamburger and Leon Hamburger, same place. Filed March 29, 1894.

539,396. Railway-Signal. John Stringham, Jersey City, N. J. Filed Feb. 6, 1895.

MISCELLANEOUS.

539,024. Electrical Connector. Frank N. Bell, Milford, Mass. Filed July 28, 1894.

539,040. Insulator. Leonard H. Desisles, Boston, Mass., assignor of one-third to Frederick S. Palmer, same place. Filed Sept. 10, 1894.

539,079. Electric Push-Button. August J. Oehring, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Nov. 2, 1893.

539,099. Annunciator Connection for Multiple Switchboards. Giles Taintor, Keene, N. H., assignor, by mesne assignments, to the Western Electric Company, of Illinois. Filed April 11, 1892. Renewed March 13, 1893

539,105. Variable Rheostat. Ernest P. Warner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Sept. 18, 1894.

539,123. Cross Arm for Carrying Electrical Wires. Thomas T. Eckert, New York, N. Y. Filed March 20, 1895.

539,192. Electric-Light Head-Gear for Personal Wear. Alfred M. Rodriguez, Brooklyn, N. Y., and Edward D. Rockwell, Bristol, Conn. Filed Feb. 25, 1895.

539,216. Rheostat. Augustus C. Carey, Lake Pleasant, Mass. Filed Feb. 26, 1895.

539,222. Electric Conductor. John R. Hare, Baltimore, Md. Filed Nov. 23, 1894.

539,234. Electric Fire and Water Alarm. Gustave S. Neu, New York, N. Y. Filed Jan. 25, 1895.

539,299. Electric Track-Switch. Joseph Y. Porter, Cleveland, Ohio, assignor to J. W. Morrison, Detroit, Mich. Filed Feb. 14, 1894.

539,302. Electric Glass-Cutting. Israel L. G. Rice, Weston, Mass. Filed Jan. 2, 1895.

539,358. Electric Stop-Motion for Warping-Machines. Clayton Denn, John Cocker, and Charles Denn, Philadelphia, Pa. Filed Jan. 11, 1895.

ELECTRICITY.

VOL. VIII. NEW YORK, MAY 29, 1895. No. 20

ELECTRICITY

Published every Wednesday by the

ELECTRICITY NEWSPAPER CO.

B. E. GREENE, PRES'T. L. J. MONTGOMERY, SEC'Y.

PUBLICATION OFFICE:

6 Park Place - New York

EDITORS: NELSON W. PERRY.
BURTON E. GREENE.
R. H. WILLOUGHBY.

BUSINESS MANAGER, - - JOHN L. GANS.

SUBSCRIPTION RATES:

UNITED STATES,	$2.50
IN CLUBS OF FIVE OR MORE,	$2.00
FOREIGN COUNTRIES,	$4.50
SINGLE COPIES,	10 CENTS

ADVERTISING RATES:

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.

Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

ENTERED AT THE N. Y. POST OFFICE AS MAIL MATTER OF THE SECOND-CLASS.

TRADE SUPPLIED BY
THE AMERICAN NEWS COMPANY,
THE WESTERN NEWS COMPANY,
And their Agencies in all Principal Cities.

EDITORIAL NOTES.

The Great Trolley Litigation. Elsewhere in this issue we give a somewhat extended report of the arguments in the equity suit of the Thomson-Houston Electric Company vs. the Winchester Avenue (New Haven) Railroad Company and the Westinghouse Electric and Manufacturing Company, which will be read with interest by every electric street railway man in the country, whether his interests be those of the officer or operator of the road or merely those of the stock or bond holder. No apology is offered for the space devoted to this subject, since its importance ranks fairly with that of anything that has heretofore come before the courts of an electrical nature.

The meaning of this suit is simply this—that if the plaintiffs win every trolley car in this country built or operated by others than the plaintiffs, who are the General Electric Company, and whose building or operation has not been authorized by the plaintiffs, is an infringement upon their patents. If they win, every electric railway in this country not built or authorized by the plaintiffs will have to pay tribute to the G. E. Company or abandon the use of the modern trolley. On the other hand, if the defendants win, the modern trolley in its broad sense is open to the public.

The Winchester Avenue Railroad of New Haven, Conn., was partly equipped by the Westinghouse Company with the trolley devices used by that company. The General Electric Company, owners of the Van Depoele trolley patents, sue the two companies for infringing two of the Van Depoele patents, which they claim broadly cover all of the travelling contact devices or trolleys used in this country to-day. The defendants deny the patentability of the devices claimed, owing to the previous state of the art, and also owing to the alleged fact that the patents in suit were anticipated by previous patents granted to the same inventor.

If the complainants' position is valid, the Van Depoele trolley patents are nearly as broad as the original Bell telephone or the Berliner microphone patents. It seems exceedingly doubtful, however, if in view of the previous state of the art their position can be maintained. Should it be maintained, however, it would, we are happy to say, not place in the hands of the G. E. Company a monopoly of the trolley business. There are many other efficient methods of maintaining a travelling contact not contemplated in the patents in suit, one of the best of which is used abroad in many cases in preference.

Reference is here made to the flexible sliding contacts usually mounted in the form of a parallelogram on the top of the car. One great advantage that this form of contact has is that it does not lose contact with the wire and that upon reversing the direction of the car it is not necessary to pull down the trolley, reverse its position and then adjust it to the conductor. In fact, we have often wondered that this device, so well and favorably known abroad, has not been adopted here to the exclusion of the devices with which we are familiar.

Judge Townsend, before whom the arguments were made, is regarded as a very strong and able judge, and those interested congratulate themselves that the decision is in such competent hands. It is thought that several months will elapse before the decision is handed down.

* * *

The Status of the Microphone. Just what effect the rehabilitation of the Berliner patent will have upon the telephone business is a question upon which those most closely interested seem to differ somewhat. It was supposed by many, and we ourselves were for the time under the impression, that the decision in the Bate Refrigerator case settled the Berliner patent for all time irrespective of any decision that might be given on appeal in regard to the validity of the methods employed to keep it in the Patent Office or the expiry of the Lake patent of 1880 in Great Britain.

The Bate decision settled once for all the question as to the limitation of an American patent by the expiry of the *same* foreign patent granted to the *same* inventor before the American patent, but the question as to the effect of a foreign patent granted to another person, or of a foreign *species* patent granted to the same or another person before an American *genus* patent, has never yet been decided in the courts unless the United States Circuit Court of Appeals in the recent decision in the Berliner suit passed judgment on this point.

Among our most profound students of patent law it is generally thought that unless the foreign patent previously granted is for the same thing substantially, and issued to or by the consent of or authorization of the American inventor, the American patent is *not* limited by the foreign patent. In other words, if the American patent, as in the case of the Brush storage battery, is a generic patent, and some one gets out a foreign patent which is not generic but simply an improvement upon the American patent, or some one not authorized by the American inventor takes out a foreign patent for *substan-*

tially the same thing, the American patent is not limited by the life of the foreign patent.

Our best attorneys, however, admit that this point is yet unsettled, and unless the recent decision at Boston throws some light on the question it is still moot.

True, in the suit of the Commercial Canning Company vs. Fairbanks Canning Company, where this question was brought up, the Court seemed to lean to the view that a foreign species patent did limit an American genus patent, but the opinion was not decisive.

In the Berliner case, the British Lake patent, granted in 1880 and expiring in 1894, was a species patent and by Judge Carpenter held to limit the Berliner patent. In this case the limiting patent, although simply for an improvement on the original Berliner patent, was taken out in England by Berliner's agent by his consent and authorization. The question still remains open, what would have been the effect of the expiry of this patent had it been taken out by some one else than Berliner or his agent? A similar case was the Edison carbon microphone patent This also may be considered to be but an improvement on the Berliner, but having been taken out independent of Berliner is believed not to have had a limiting effect on the latter's patent.

As to the effect of the recent decision upon the general telephone business, we find that it is less than would generally have been predicted. We have taken pains to feel the pulse of those who would naturally be expected to be most seriously affected, and find that they look upon the future with entire equanimity. The feeling is very well expressed in the following reply to one of our letters of inquiry to an officer of the Western Telephone Construction Company. It reads as follows:

> The recent Appellate Court decision will seem to prove of more value to the legitimate telephone business than harm. It will weed out the unstable and define the scope of operations. The Bell people will find themselves further away from their coveted monopoly by reason of this decision than before. The people want improvements, extensions and advantages in this art denied by the Bell monopoly, and where there is need there will be genius to offer the means. The best devices in telephone apparatus are already outside of the Bell domain, and it is reasonably sure that the public will be supplied with the highest class of modern improvements in this line without paying much tribute for patent rights or monopoly privilege.
>
> The Western is still forging ahead.
>
> J. E. KEELYN.

Another effect which the decision will have will be to make more generally known the fact that other transmitters than those based on the Berliner patent are equally as good, if not better. As stated in our last issue, the Bell Company have so industriously given currency to the idea that the microphone was essential to the art of telephony that the public has been led to believe that it was true. Nothing in fact is further from the truth, and ELECTRICITY hopes to demonstrate that fact in a manner to leave no shadow of a doubt in the minds of the public.

* * *

IF THE *Electrical World* deserved credit for its reports of the lamp litigation in 1893, and we think it did—it certainly claimed it—does not ELECTRICITY deserve credit for reporting the most important railway patent case up to date—the trolley case at New Haven? We think we do, but by comparison only. It is no great enterprise to go to New Haven at the proper time to hear and report a case that interests the whole American electrical public, but it is a great *want* of enterprise *not* to have done so. If the *Electrical World* is *fair*, and if its Digest is what it *claims* to be, the readers of that paper will see a report of this case in the Digest a *week after this* credited to ELECTRICITY. Will it be fair? We'll see.

* * *

The Gas Engine Business. The discussion of the status of the gas engine, the first part of which we published last week, brings up a subject upon which we have long been intending to make some remarks ourselves. It is a subject in which we are interested professionally and to which we have given considerable study. The result of this study has been two fold. First, we have been convinced of the economy of the gas engine and its adaptability to small (and large) isolated electric lighting plants, and second, we have been more than convinced of the utter incompetency of the average gas engine manufacturer of this country to properly handle this business. There is no field more promising for the gas engine to-day than the electric lighting field if properly cultivated, and the electrical press in general, and ELECTRICITY in particular, have done what could be done to educate the public up to an appreciation of this fact. We have done this not for the benefit of the gas engine manufacturer, for we are under no obligations to him, but for the benefit of the public. The manufacturer, instead of appreciating this fact and taking advantage of it as a man in any other business would, seems to have shut his door to this avenue of trade as effectually as he would against the smallpox if he knew it was seeking admission. His attitude to the trade is inexplicable upon any business hypothesis. To illustrate one part of our meaning, it is almost impossible for an inquirer to obtain prices or other information from any of the leading manufacturers or their agents without having first satisfied such manufacturer or agent that he is a "proper party." For example, an electrical engineer of our acquaintance some time since had occasion to use some figures and applied to the New York agent of a large Philadelphia firm manufacturing gas engines for his list price. Note that he did not want net prices, but merely list prices. The agent wanted to know first who he was, next what he wanted them for, and then what size he wanted the price on. The engineer stated that he wanted prices on all sizes from 1 H. P. "What do you want with a 1 H. P. engine?" was asked. "For a small electric lighting plant," was the reply. "You can't do anything with a 1 H. P. engine, and besides nobody in this country but us can go into the lighting business with gas engines," said the polite agent. "I suppose that settles the matter," said the engineer, putting on his hat and walking out. This gentleman took pains to inquire whether this was the customary treatment accorded inquirers by this particular agent, and finding that it was, and thinking that the firm he represented should know how they were being represented, wrote them, stating at the same time that he declined to have any further dealings whatever with their New York representative. To his surprise he received a somewhat curt reply upholding the New York man in every particular.

This treatment of would-be customers by gas engine manufacturers and their agents has become so notorious as to deter many from making inquiries which they would otherwise like to make, and this particular experience has cost the firm referred to several orders of considerable size. How different would be the experience of an inquirer after steam engines, dynamos, motors or any other commodity under the sun. He need only let it be known that he is in want of the goods to be overrun with gentlemanly agents only too willing and too anxious to give him all the information they possess.

Now, as to the truth of the statement attributed to this particular agent, that no one could go into the gas engine electric lighting business but the firm he represents. We know of quite a number of electric lighting plants installed during the past few years by this same firm and not one of them gave satisfaction until they had been repeatedly overhauled and changed about in accordance with good engineering practice, and not a few installed upon guarantee of satisfactory performance have been bodily thrown out after repeated failure to have the guarantee made good.

To such an extent have the business methods of leading gas engine manufacturers disgusted the investing public that capitalists and business men who would like to go into the business of equipping small lighting plants driven by gas engines have in a number of cases within our knowledge given up the idea. In another case within our personal knowledge a Philadelphia company of large capital intending to go into this very business have given up all idea of dealing with American manufacturers and are preparing to send or have already sent a representative abroad in the hope that there at least they will be able to deal with business men who will give guarantees that are worth something.

Another result of the policy of the American manufacturers is that English, German and French manufacturers are establishing agencies in this country for their gas engines, and in the discussion which we conclude in this issue one of them, apparently a business man, and one who represents one of the most widely known firms in England, takes a prominent part. He came here with the expressed intention of introducing the oil engine of his firm. He came here not only with information in regard to what he has to sell but a willingness to impart that information that must have astonished the manufacturers of this country. Do the latter think they can compete under their present policy with competitors, even from abroad, who not only know what they have but are willing and anxious that the world should also know it?

Mr. Richmond, of the De La Vergne Company, who has had a wide experience with the men who are following the inane and suicidal policy which we are condemning, spoke right out in meeting. As soon as the gas engine men suspected that the De La Vergne Company might manufacture their own engines instead of buying from them, they fell all over themselves to effect a sale. Mr. Richmond says: "I got as much as 40 per cent. discount quoted at the first slap—I don't know how much I could get by negotiation," and then they proposed that the De La Vergne Company, if they did manufacture, should add 200 or 300 per cent. profit, and then divide up with them, half and half. Mr. Richmond further says: "As a matter of fact the prices are all broken up in the gas engine business at the present moment."

Yes, the gas engine business was broken all up by the simple announcement that a single business competitor might enter the field.

The prices were, however, only cut for that competitor, but to the average purchaser they remained the same.

We prophesy that before long some competitor with a good gas, gasoline or oil engine behind him and common business tact in his head will come to the front and reap the harvest which the manufacturers are doing their best to destroy.

If, as implied by Mr. Richmond, the present prices include 200 or 300 per cent. profit, this new competitor will be satisfied with 25 or 50 per cent. Whether or not the present manufacturers continue to require your pedigree and certificate of character before they will impart any information, the new competitor will require no other credentials than other business men require and facts will be freely and fully given. Whether or not the present manufacturers will continue to try to monopolize the use of their own engines for electric lighting (a business which they have generally shown themselves totally incompetent to handle), and give guarantees that are not worth the paper they are printed on, the new competitor will be glad to sell to every one who can pay a fair price for his engine, and he will sell to them low, and give a guarantee that can be relied upon in every particular. The American public and Electricity will welcome this competitor with open arms. We all hope he will be an American, but we will welcome him anyway if he changes, as he must, the present order of things.

Keely and His Motor and a Challenge. In the April number of the *New Science Review* is an article by John W. Keely himself describing (?) not only his motor but the philosophy of it. If we cannot quite grasp his meaning at all times it is of course our fault, for he has expressed himself in language which certainly cannot mean anything else but that which he intended it to mean. What he intended it to mean, Heaven and Mrs. Bloomfield Moore, himself, and possibly Mr. J. M. Stoddart, the editor of the *Review*, only know, but it *can't* mean anything else. It is, therefore, perspicuous in a high degree. It means something on the same ground that the dog was a good coon dog—it had been tried for everything else under the sun and found worthless, but God made everything for a purpose, and since the dog had been tried and failed on everything else it was concluded that the Almighty intended him for hunting coons.

So with Keely's language. We have gotten out our Greek and Sanskrit lexicons; we have rummaged the shelves of old papyri dating back of the time of Rameses I; we have studied the hieroglyphics on the backs of all the mummy scarabs we could find in the cases of the Museum of Archæology; we have compared it with the inscriptions on the Rosetta stone and the hieroglyphs of the Mayas on the ancient temples of Chichen Itza; but all to no purpose. None of these throw any light upon the subject, and we have concluded that Mr. Keely's description describes nothing in the sea or under the sea or on the land or under the land or in the air above the land. But it *must* describe *something*. Else why should Keely have written it? Else why should Mrs. Bloomfield Moore "withdraw the veil?" Else why should J. M. Stoddart print it? There is but one recourse left, as with the dog—to believe that it describes Keely's motor.

Let us consider that matter settled, then.

At the end of the article Mr. Keely enumerates a number of tests which he is willing to put his motor to in the presence of scientists. We do not doubt for a moment that his motor, or whatever he calls it, will successfully perform every one of the things there enumerated. And supposing it does? What has it accomplished? Will it do no more than this? Is this the discovery about which Mrs. Bloomfield Moore has been prating so long and so loudly?

Oh, what a-groaning of the mountain! and oh, what a birth!—*ridiculus mus.*

These tests, if all accomplished successfully, would have the same value to the world as have the usual spirit communications—no more, no less. They would indicate an accession to our knowledge quite on a par with that which is brought to us from the dead through the agency of professional spiritual mediums and other like impostors.

We do not pretend to be versed in occult things, but we hereby issue a challenge:

We will undertake to repeat, without recourse to other than well known physical agencies, every phenomenon which Mr. Keely will produce by his so-called newly discovered force or agencies. To enable us to do this we ask no especial privileges within the arcana of Keely's workshop. We ask only to be permitted to see the experiments performed as he will show them to other experts, in order that we may know the task which is before us.

If Mr. Keely will give us this opportunity we will agree to repeat everything which he does before the same committee of experts, provided they are men of recognized standing in the scientific world, within sixty days. If Mr. Keely and his friends have confidence in themselves they will not let this challenge go unnoticed.

Under the Searchlight.

Views and Opinions on Timely Topics.

BRUSH COMPANY'S ELECTION.

Coffin, Lawrence and Miles Step Out.

At the annual meeting of the Brush Electric Company in Cleveland last week, Mr. Robert Treat Paine was chosen president in place of W. H. Lawrence, J. P. Ord vice-president in place of C. A. Coffin, C. G. Smedberg treasurer in place of B. F. Miles, and Mr. S. M. Hammill general manager. The meeting was interesting, lasting the greater part of two days. Full details will appear later in Electricity. Mr. Smedberg was formerly assistant treasurer of the Edison General Electric Company.

It may interest other lamp makers to know that the Harrison Lamp Works bill their lamps to the Schenectady office at 8½ cents apiece.

* * *

The conviction of Henri Bier at New Orleans for perjury shows that even in that cosmopolitan city, where reform has been looked upon as hopeless, there is a sharp awakening. Mr. Bier is a wealthy man and has always stood well in his city. He got mixed up in the procurement of franchises for a branch of the Traction Company, and in a previous case shielded his friends by making false statements on the witness stand. For this crime he has just been convicted. The incident shows that even in corporation matters bribery and perjury are *sometimes* held to be criminal by the courts.

A Warning to G. E. Employees.

(From the San Francisco Examiner.)

Ward Gets Ten Years for Bribery.

There was a tearful scene in Judge Smith's court room, Stockton, this afternoon immediately after the passing of sentence on Charles W. Ward, convicted of bribery in connection with the adoption of plans for the new County Hospital.

The defendant stood up and the Judge in passing sentence said that bribery was considered one of the most serious of offences, and the Legislature had so said in fixing the punishment at from one to fourteen years, and in disqualifying the offender from ever holding any office of trust. The term of imprisonment was then fixed at ten years in San Quentin. As the sentence was fixed by the Judge the defendant gasped and sank back in his chair, burying his head on the breast of his wife, who was seated by his side. His little six-year old child added her tears to those shed by husband and wife, and altogether the scene was an impressive one.

Lighting Deal in Brooklyn.

It is announced that the Brooklyn Edison Company has purchased nine-tenths of the stock of the Citizens' Electric Light Company of that city. This trade means an entirely new situation in Brooklyn lighting matters.

When the Edison Company came into the field in Brooklyn they found the political machinery in the hands of the men who owned the two other companies which did all the city lighting at a good fat rate, and a small amount of commercial incandescent work. It took the Edison Company, made up from the solid element of the city's business men, over two years to get a franchise. They refused to pay a dollar to the Board of Aldermen, and finally compelled the granting of a franchise in the courts. They did not have any chance at city lighting contracts until last year when a reform administration came in. This year they found that even under a "reform" Board of Aldermen specifications were drawn in a way to practically prohibit their bidding on the city contract.

The present deal does not mean that the Brooklyn Edison Company have ceased to believe that honesty is the only policy to pursue in business, but that they have at last been forced to pay the ring what they want. The money has been paid in an honorable way—$170 per share for the stock of the Citizens' Company—but it is none the less the payment of just about the original price demanded by the ring for allowing the Edison Company to do business.

It may be that this Brooklyn ring will be broken up some time. It is certain that it is still just about as powerful as ever, and equally certain that the members will retire, if they ever do retire, with bank accounts large enough to enable them to live in peace and contentment. Their consciences will not disturb them.

* * *

Its Reason for Existence.

(From the U. S. Investor.)

It has been stated this week that General Electric stock was booked for a handsome advance. But one opinion, however, exists regarding the company—it is kept alive merely to furnish certain speculative bankers a football out of which to kick stock market profits.

* * *

A SPECIMEN GENERAL ELECTRIC ASSET.

In the report of the Gas and Electric Light Commissioners of Massachusetts for 1891, the Lee Electric Company appears for the first time and returns the following assets:

Gas plant, mains and meters	$8,185.85
Real estate (electric)	4,485.27
Steam plant and water power	2,952.62
Electric plant	4,899.60
Lines, meters, lamps, etc	12,777.96
Supply account	2,874.11
Material on hand and accounts receivable	9,465.20
Total	$37,454.76

The liabilities were returned as follows:

Capital stock	$20,000.00
Bonds issued	15,000.00
Unpaid bills	1,982.49
Total	$36,982.42

The returns show that the electric plant was as follows:

One 650-light T.-H. alternator.
Two 160 H. P. boilers.
Two 165 H. P. engines.
One 60 H. P. waterwheel.
91,000 feet wire (in lines).
649 16-C. P. incandescent lamps.

The liabilities therefore footed up, to begin with, about $43 per lamp installed. In the report of "securities" held by the G.E. Company, on page 81 of ELECTRICITY, current volume, it appears that among them are $11,000 of these bonds, and that the "Securities" Company has $19,400 of the stock; presumably some local citizen or citizens have the other $600.

According to the returns of subsequent years the floating debt, consisting of notes and unpaid bills—presumably due largely to the G. E.—has accumulated as follows:

1891 (as above)	$1,982.42	1894	$40,150.56
1892	7,864.49	1895	45,203,44
1893	20,792.08		

So that the gross liabilities have now reached the tidy sum of $80,203.44. The number of 16 C. P. lights returned in 1895 was 1,500. The results of operations for the year ending June 30, 1894, were as follows:

Income from sale of electric light and power	$5,480.84
Operating expenses	5,541.93
Deficit	$61.09

In order that the brilliancy of the future prospects of this enterprise may be appreciated, the following statement, showing the rate of increase of population in the town of Lee is given, as taken from the census reports:

1860	4,420	1880	3,939
1865	4,035	1885	4,274
1870	3,866	1890	3,785
1875	3,900		

A *decrease* of 635 in population in the last 30 years.

The prospects of this plant ever paying a dividend may be easily ciphered out from the above statistics. How many other "securities" of equal value are contained in the schedules of the General Electric?

* * *

THE ELECTRIC CONSTRUCTION AND SUPPLY COMPANY.

If the failure of the Electric Construction and Supply Company of this city, and incidents attending it, constituted an isolated case of dishonesty, it might with propriety have passed unnoticed. But it is not, unfortunately, an isolated case. No failure reported in this trade in the past three years has left those connected with it free from deserved criticism. In nearly every case, as the facts were revealed, it was shown that the failure should have come earlier, before the debts were out of all proportion to assets. And in nearly every case the *insiders* engaged in a disreputable scramble to protect themselves at the expense of the legitimate commercial creditors.

Of the latter feature the collapse of the E. C. and S. Co. was a conspicuous example.

The electrical trade will never be upon a solid basis—will never be worthy of financial credit or the respect of the public—until the ideas of business revealed by such failures as the one under discussion and the men holding them are driven out and replaced by men and ideas more in harmony with the established laws of commercial integrity.

The *causes* of this failure may be passed over briefly, yet they are important in considering the actions of the management when the crash came.

The E. C. and S. Co. was simply a selling company. It was capitalized at $225,000, about $85,000 of which stock had been sold to the public. In the days of prosperity its gross sales were about $300,000, and the profits were large.

Its product was manufactured by the Standard Thermometer Company of Peabody, Mass., of which Mr. F. R. Upton, Mr. Rice and others of Mr. Upton's relatives were the chief owners. The product was never manufactured with any degree of skill, and was unsalable when delivered to the E. C. and S. Co., necessitating the maintenance in New York of shops in which every lamp had to be overhauled before shipment. Notwithstanding that the work of the manufacturing company was inferior, the prices charged to the selling company were 25 to 33⅓ per cent. higher than the work could have been done for on contract elsewhere.

When the great falling off in sales occurred in 1893, the E. C. and S. Co. was still *compelled to take the product from the factory*, at one time having as many as 8,000 lamps in stock, for which they were unable to pay, giving notes therefor endorsed by Mr. Upton.

Counting the extra cost of lamps made at the family factory over what it would have been under other circumstances with the cost of the repair shop in New York, the total cost of each lamp was nearly double what it should have been. So much for the causes.

The condition of the company naturally became worse and worse. When failure was inevitable, a Mr. Rocap was elected treasurer, and empowered by the Board to make transfers, etc. He was in office ten weeks before the collapse. When the receivers were appointed it was revealed that he had given to Mr. Upton a bill of sale of about $35,000 worth of stock, and had assigned to him accounts of about $30,000, leaving say $10,000 of stock for the receivers to sell for the benefit of the outside creditors. The total debts were about $105,000, and if the assets were equitably divided, it will be seen that the creditors would come out fairly well, getting perhaps 70 cents on the dollar.

In addition to the grab of Mr. Upton, Mr. Rice got out attachments for salary as an officer of the selling company, although he had performed no services for that company.

The stock of the E. C. and S. Co. seized by Mr. Upton is now offered for sale by a Mr. Waterman. Whoever he is, we are not surprised that Mr. Upton or Mr. W. J. Hammer, his assignee, did not offer this stock over their own names. It shows that they had some appreciation of their position at least.

One fact we wish to call particular attention to: This stock of goods, according to the rules of common honesty, should have been in the hands of the receivers and the proceeds divided pro rata among all the creditors. It is indeed an open question whether the assignments to Upton were valid in law.

Every man paying Mr. Upton any money either for stock or on account of bills due the E. C. and S. Co. does so at his own risk. The purchaser may still be sued by the receiver for the recovery of the property, or may be compelled to pay his bill twice over.

The episode, we think, marks the close of Mr. Upton's career in the electrical business. He will have to find another field.

As for Mr. Hammer, we suppose there will always be a demand for the servicces of such as he. Whenever there is particularly dirty work to be done he will be called on, and will always be found ready, for a consideration, to do anything required of him.

It is not a pleasant duty for a trade paper thus to point out the rottenness in its own trade. It is, however, a duty which must be performed. When dishonest and corrupt methods have been reduced to a minimum, as they are in other industries, then and not till then will this trade be upon a proper basis, worthy of the respect of the world and inviting the investment of capital.

We take special pleasure in pointing out that in the total wreck of the E. C. and S. Co.'s business, and amid all the crookedness revealed thereby, two men stand out clearly, unashamed of their relations, unstained by any dishonest acts—Herbert Torrey and Robert B. Corey. These gentlemen refrained from taking any steps to protect themselves at the expense of the other creditors when they might have done so with perfect propriety for salary due and earned. They erred on the side of fairness.

And we think time will show that in this case *it paid* to do right, and that those who did wrong will pay the penalty.

Personal.

Mr. John C. Dolph, 126 Liberty street, New York, has been appointed manager of the Eastern district for the Forest City Electric Company of Cleveland, Ohio, manufacturers of the well-known "Roll Drop" commutator bars.

Mr. J. H. Rhotehamel, president of the Columbia Lamp Company, has been in New York the past week. He reports the Columbia Company's business in flourishing condition, and that they are ready now to sell 220 volt lamps in any quantity.

Mr. C. I. Hills, who has represented the Columbia Lamp Company in this city for about a year, has made arrangements to go with the Perkins Switch Company of Hartford, beginning June 1. Mr. Hills began his electrical business career with the Perkins Lamp Company in 1889, continuing with them and with the Waring Company until the latter was finally closed by the courts. He has the reputation of being the best lamp salesman in the business, and has made many friends. For the Perkins Company he will handle their full line of switches, sockets, cut-outs, Waterhouse arc lamps and incandescent lamps.

Railroad Patent Litigation.

THE UNDER-RUNNING TROLLEY.

Final Hearing of a Case Involving the Basic Patents of the Modern Trolley—The General Electric and Westinghouse Companies Lock Horns.

The suit of the T.-H. Company vs. the Winchester Avenue Railroad Company and the Westinghouse Electric and Manufacturing Company came up for final hearing in the United States Circuit Court at New Haven, Conn., on Wednesday morning, May 22, and continued through the rest of the week. This suit is one of unusual importance and interest in that it involves the validity of the Van Depoele patents, which are claimed to broadly cover all of the under-running trolleys in use to-day on the electric railroad systems throughout the United States. These patents were acquired by the Thomson-Houston Electric Company—now merged into the General Electric Company—and all unauthorized users of the modern trolley are claimed by the plaintiffs to be infringers, and they have sued the present defendants to establish their claim and also for an accounting.

This suit is for infringement of two letters patent based on the invention of Charles J. Van Depoele (deceased).

The first of these patents (in order of date of application) is that dated April 11, 1893, No. 495,443, based on the application signed and sworn to on January 17, 1887, and filed in the Patent Office March 12, 1887.

The Patent Office file of this application shows that the application was long delayed in the Patent Office owing to interferences with rival applications of R. M. Hunter and others, the final decision in favor of Van Depoele having been rendered on February 4, 1893, and the patent issued a few days thereafter. The inventor had in the meantime died and the patent was issued to his executors and by them was assigned to the complainants.

The second patent is dated April 11, 1893, No. 495,383, and is based on the application sworn to November 15, 1887, and filed June 18, 1888. This patent also was long delayed owing to interference with F. J. Sprague, but was finally awarded to Van Depoele on December 15, 1892.

On the first patent the claims at issue are the following, which are the 6th, 7th, 8th, 12th and 16th, of which the 6th is the most general and the 16th the most specific. They read as follows:

"6. In an electric railway, the combination with a suitable track and a supply conductor suspended above the track, of a car provided with a swinging arm carrying a contact device in its outer extremity and means for imparting upward pressure to the outer portion of the arm and contact, to hold the latter in continuous working relation with the under side of the supply conductor, substantially as described."

"16. In an electric railway, the combination of a car, a conductor suspended above the line of travel of the car, an arm pivotally supported on the top of the car and provided at its outer end with a grooved contact wheel engaging the under side of the suspended conductor and a tension spring for maintaining an upward-pressure contact with the conductor, substantially as described."

The specification describes the drawings in detail, in which Fig. 1 illustrates the combinations claimed as a whole; Fig. 7 shows a modification of the contact wheel (with its arm support and spring), and Fig. 9 shows, on an enlarged scale, the vertical and transverse axis upon which the contact carrying arm is sustained.

Of the second patent (No. 495,383), which is for an improvement upon the system broadly claimed in patent No. 495,443, the claims involved in this suit are the 11th, 12th and 13th, which read as follows:

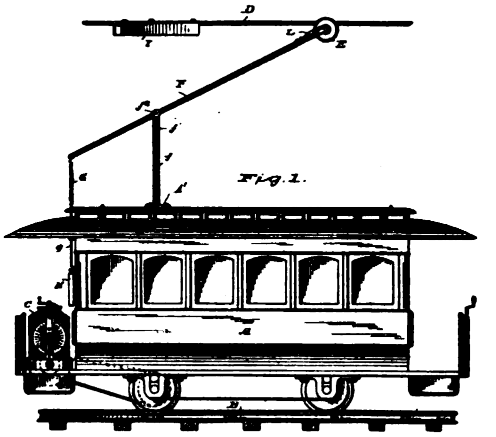

Fig. 1.

Fig. 7.

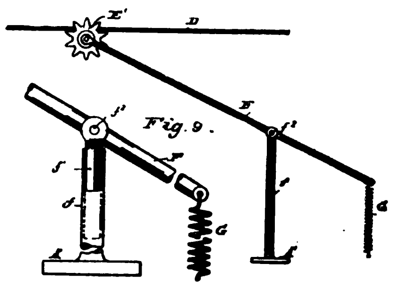

Fig. 9.

"11. In an electric railway, the combination of a car, an overhead conductor, a standard on the car, a rotating support thereon, an inclined contact carrying an arm hinged upon said support and a tension spring secured so as to rotate with the support and acting upon the said arm for holding the contact device in position."

"12. In an electric railway, the combination with a car of a standard on a car, a rotating support thereon, an arm hinged upon said support and provided with a grooved or flanged contact device for engaging with a suspended conductor, and a tension spring secured so as to rotate with the support and acting upon the said arm to hold the contact device in position."

"13. A reversible contact device for an electric railway vehicle, consisting of a standard, a rotating support thereon, a contact carrying arm hinged upon said support, and a tension spring secured so as to rotate with the support and acting upon the contact-carrying arm for holding the contact device in position."

The specification states that the novel features of this application comprise an improved apparatus whereby the upward pressing contact is maintained against the conductor and means are provided "for reversing the position of the contact arm upon the car, together with various details of construction and arrangement," and Fig. 5 is given as an elevation showing the embodiment of his invention.

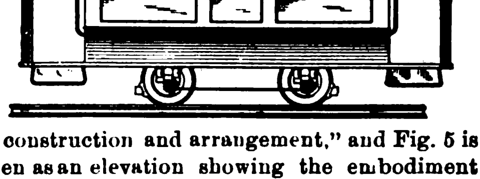

Fig. 5.

The defendants claim in defence respecting No. 495,443:

1. That the invention was anticipated by several prior American and British patents in the same art.

2. That the invention was anticipated by the prior public use of Daft at Baltimore.

3. That the invention was made not by Van Depoele, but by one Verstræte, an employee of the Van Depoele Company.

4. That the invention was made by Sprague before Van Depoele made it.

5. That in view of the state of the art there was no invention involved in making the combination of the claims.

6. That the same invention had, before the issue of said patent, been patented to Van DePoele by several prior patents.

7. That the same invention was inseparably involved in inventions previously patented by the same inventor.

Respecting No. 495,383:

1. That the alleged invention was anticipated by several prior American and British patents.

2. That in view of the state of the art there was no invention involved in making the combinations of the claims in suit.

3. That there is no evidence that Van Depoele made the invention prior to June 18, 1888, the date of his application for the patent, and that the alleged invention was therefore anticipated by the prior public use of Sprague at Richmond.

4. That, if the alleged invention was embodied in the New Orleans road, it was in public use and on sale more than two years before Van Depoele's application for the patent.

5 That the same invention had, before the issue of said patent, been patented to Van Depoele by several prior patents.

In regard to anticipation the defendants hold that the following preceded the Van Depoele inventions:

(1) Wesson's Patent. Granted Feb. 17, 1857, for improvements in electric telegraphs.

The object of this is stated to be "to transmit telegraphic communications between railroad trains, canal boats and other vehicles, etc." It consists briefly of a telegraphic line suspended from posts at the side of the track which are supplied with current from a stationary source. This line is divided into sections at the posts, and on each post is a circuit breaker which is operated by an arm, mounted on the middle of the car, so that as the car passes the post the line circuit is broken and the current is deflected through the car where it operates a telegraph apparatus.

They claim that this patent discloses an overhead conductor suspended at the side of the track and supplied with current from a stationary source, a railway car provided with a contact device carried by the car, attached to a projecting arm moving freely so as to compensate for "the swaying motion of the vehicle from whatever cause," the said arm carrying at its outer end a grooved contact device which is pressed upward by a suitable spring (tension device) into engagement with the under side of the conductor.

The current transmitted to the car is used to operate a telegraph instrument instead of a motor for propelling the car, but it is claimed that this substitution was not new with Van Depoele as it had been done prior to his invention by Siemens, Finney, Cowles and others. It was at the side of the track instead of over the car, but this difference was not new because it had been previously so placed by Goodwin, Finney, Cowles and others.

(2) Fitzgerald Patent. This was for an arrangement of devices whereby signals could be transmitted between a train of cars to the station or to another train. It describes a method of underrunning brushes making contact with transverse wires overhead connecting with longitudinal wires. Date of patent June 22, 1869.

(3) Smith Patent. Aug. 5, 1873. This relates "to the construction of a system of railway telegraph mechanism by which upon lines of railway all of the trains of a line may be kept in communication with the various stations of the line and with each other if desirable."

In the words of the inventor, "For this purpose I construct a line of wires so arranged that either a constant or an intermittent current

(*Continued on Page* 270.)

THE STATUS OF THE GAS ENGINE.

A Statement and Discussion of the Subject Before the American Society of Mechanical Engineers at Their Monthly Meeting April 10, 1895.

DISCUSSION—(*Concluded.*)

Mr. Reeve was followed by Mr. Anson W. Burchard, who read a paper on the gas engine installation at the works of the Danbury and Bethel Gas and Electric Company at Danbury, Conn.

In 1893 it became necessary for the Danbury and Bethel Gas and Electric Light Company to erect a new electric station, their business having outgrown the capacity of their former station, and advantage was taken of the opportunity to place the new station on a site adjoining that of the gas works, in anticipation of being able to effect some economy in administration thereby.

This company manufactures gas by the Edgerton process, in which the retorts used for fixing the oil gas are heated by a producer gas flame, and the apparatus for making this gas is regularly employed in this work.

The economical performance of the gas engine plants operated by producer gas in Europe led to the belief that a moderate amount of power could be generated by this means at a lower cost than by steam, particularly where water for condensation is not available, as in the case under consideration.

After some investigation of this subject, it was decided to install a gas engine plant, the company being favorably situated in respect to its having the necessary apparatus for making the producer gas. A number of gas engines of large size in operation were inspected and an analysis made of the difficulties experienced in their use; and in planning the installation arrangements were made to overcome these difficulties so far as this could be accomplished.

It was found that none of the builders in this country were at that time prepared to furnish engines of larger units that 100 H. P., nominal, and three of that size were ordered. They were of the Otto type, two cylinder, single acting, the cylinders being placed one over the other, with connecting rods engaging a single crank. On account of the low quality of producer gas and the difficulty of igniting it, it was decided to use electric sparks from an induction coil for this purpose. This plan enables the ignition to be effected at exactly the desired time.

The engines are provided with gas, air and exhaust valves of the poppet type, affording facilities for regrinding to maintain tightness.

The engines were placed side by side with crank shafts in line, and to extensions of these shafts there were fitted clutches, so that the engines could be coupled together with the cranks 180 or 120 degrees apart.

Another arrangement was made for coupling the governors, so that by connecting them and the shafts the engine could be run as—

(1) A four cylinder engine with two cranks, 180 degrees apart.

(2) A six cylinder engine with three cranks, 120 degrees apart.

The cylinders being arranged to take gas alternately with two engines running coupled, there were two impulses or two opportunities to govern per revolution, and with three engines running there were three impulses or three opportunities to govern per revolution.

A further provision against irregularity of speed was made in a balance wheel on the counter shaft, weighing about 6,600 pounds and speeded at 483 revolutions per minute.

At this time the engines were arranged to regulate the power by either admitting a full charge of gas or cutting it off altogether as the load increased or diminished.

Experiment showed, however, that with the producer gas it was possible by regulating the the quantity of gas admitted to the cylinder per impulse to obtain impulses varying considerably in power, and it was possible to ignite a very weak mixture of gas and air, and that the loss of economy due to the use of a reduced charge of gas was not serious; and the engines were subsequently fitted with conical governor cams by which means the supply of gas per impulse is varied according to the power required, within certain limits, below which the supply of gas is cut off altogether.

This was found to improve the regulation very much as compared with a single engine, or with two or three engines running uncoupled, and as satisfactory regulations could be obtained without coupling the engines, the use of the couplings was abandoned, since they required to be handled with some care, particularly in coupling two engines when in motion. In ordinary service the variation on the alternating current E. M. F. is not over two per cent.

182 days. Average Output per day, 435,000 Watt Hours.

Special arrangements were made for belting the engines to the countershaft, the high speed of which required the use of small pulleys, 26 inches in diameter. The clutches were considered impracticable because of the irregular driving effect of the engines, besides which the small diameter of the pulleys would have necessitated placing the clutches outside them, involving the use of quill arrangements with separate bearings, which would have taken up a great deal of room on the shaft.

A frame carrying a series of rollers was placed at each side of the driven pulleys, and by running the rollers between the belt and the pulleys the belt can be lifted off the pulley, the tension of the belt being regulated by an idler pulley carried on upright frames and moving conjointly with the roller carrying frame. Thus, when the rollers were in a position lifting the belt off the pulley, the idlers would be raised and the belt nearly straight. When it is desired to connect an engine with the shaft, the rollers are run around to a position between the upper and the lower parts of the belt, allowing it to come in contact with the driven pulley, and the necessary tension given the belt by lowering the idler pulley, which also increases the arc of contact between the belt and the pulley.

The advantages of this arrangement are that none of the parts of the shafting device are in motion except while the belt is being shifted, that little room is taken up on the shaft, only four inches on each side of the driven pulley, and that the power is transmitted to a pulley keyed rigidly to the shaft. The idler pulley moves simultaneously with and in proper relation to the rollers, and has an independent adjustment for maintaining a proper tension on the belt.

This device is made use of to start the engines also, the practice being to get the shaft under motion by means of a small steam engine, and then to start a gas engine from the shaft by the belt.

Oil is supplied to the engine bearings and journals through a system of pipes, is collected, filtered, and pumped into a tank, from which it is drawn for use again.

The tests described were undertaken for the purpose of determining whether the engines were capable of developing the amount of power which they had been represented as being able to perform.

As the power is in a large measure dependent upon the quality of gas furnished, a standard had to be determined for this. As a large number of analyses made by Mr. H. H. Edgerton, gas engineer of the D. & B. G. & E. L. Co., had shown that producer gas of about 150 B. T. U. per cubic foot, at zero C., and 760 mm. pressure was the highest which could be made in ordinary producer practice under the most favorable conditions, this was adopted as the standard for the test, and it was intended that they should be made with gas of this composition. A leak from a pipe containing illuminating gas into the producer gas holder raised the power of the gas somewhat above this figure during the first tests, but they are interesting as showing the effect of the richer gas.

This leak was discovered and stopped between March 15 and 18.

The gas was analyzed by Mr. Edgerton in a modified Franklyn apparatus over mercury, and the results give evidence of great care and accuracy. The samples from which the analyses were made were collected over mercury from the main gas pipe near the engine at a uniform rate during the test, and represent the average quality of the gas used. The gas was measured in a holder of a capacity of about 30,000 cubic feet, and in all cases this was allowed to stand several hours after filling before starting a test, to allow the gas to diffuse uniformly.

Observations of the height of the holder and its temperature were made at intervals of ten minutes and the results were reduced to zero C. and 760 mm. pressure, a correction being also applied for moisture.

The gas is made in plain generators, there being two in use, each five feet inside diameter and ten feet high. In practice the ashes are removed from them on alternate days.

The power of the engines was measured by a prony brake of the ordinary pattern, applied to a rim which was bolted to the spokes of the fly wheels.

A counter was connected with the governor shaft to record the number of revolutions of the engines.

Observations of the counters, brake load, holders, etc., were made by two observers and the results checked.

The indicator cards were taken at intervals of about fifteen minutes by Crosby indicators, made specially for gas engine use, one for each cylinder, connected directly with the ignition chambers. Most of the cards were taken with 180 pound springs, although a few were taken with 120 pound springs.

The engine cylinders were fourteen and one-half inches in diameter and the stroke was twenty-five inches, the engine constant being .0107, the clearance about twenty-five per cent. of piston displacement. The compression was from sixty-four to sixty-eight pounds and the initial pressure from 180 to 200 pounds.

The table appended shows the composition of the gas and the performance of the engines with gas of different degrees of calorific value.

A table is also appended showing the results of the operation of the station from October, 1894, to March, 1895. The figures given in this table were about as follows:

The current for incandescent lighting is measured by a Thomson wattmeter in the station, through which the entire current passes.

The current for lighting is taken from the number of lamp hours, which is carefully recorded, and an estimate of the amount of energy consumed by each lamp, based on a number of careful measurements.

The engines are fitted with an attachment by means of which illuminating gas can be substituted for the producer gas without stopping or even reducing the speed. As the illuminating gas is very much more powerful than the producer gas, at times when two engines will not carry the load during the daily period of maximum consumption, the illuminating gas is turned on for an hour or two. A record of this gas is kept, and as a correction has been applied for the quantity used. The boiler supplying steam to the producer is used to supply steam for other purposes so that no exact record can be given for the steam used in this manner, but an allowance of twenty-five per cent. has been made for this in the final footings.

The method of estimating the current sent out from the station in watts is open to criticism and these figures are given for what they are worth, and not as an exact representation of what can be accomplished by such a motive power equipment as has been described.

The experience with this station may be said to have shown that it is practicable to operate an electric station for which the motive power is furnished by gas engines operated by producer gas, that the liability to interruption of the service will be not much, if any, greater than with steam engines, and that by means of gas engines the fuel consumption in a station requiring a small amount of power can be reduced to a point considerably below that which can be obtained by the use of steam engines.

The other items of cost of gas engine power, repairs, depreciation, etc., can be determined only after a longer experience.

The Chairman—I understand Mr. Richmond has been making some experiments in gas engines. We should be glad to hear from him.

Mr. Richmond—Mr. Chairman, you are not correct in announcing the fact that we have been making experiments in gas engines. We had need of a motive power for small refrigerating machines in connection with the De La Vergne refrigerating machinery, and we started out to find a suitable motor for running these machines and the first thing that suggested itself was a gas engine, naturally. Well, we thought it would be a good thing to build those gas engines so that we might get all the benefit, and after a little while we were assailed by a number of inventors of gas engines, who came to us with propositions something like this: We build the gas engine and put about 300 per cent. upon the cost, and we divide the proceeds between us. (Laughter.) It seems to me that the gas engine business is in a rather unhealthy condition in this country at the present moment. Undoubtedly the owners or the licensees of the Otto patents had a very good thing while it lasted, and that rather excited the cupidity of the outsiders, and they were prepared as soon as the Otto patents ran out to build gas engines at any price they could be sold at, and realize an immense fortune for everybody concerned in the matter. I have catalogues I think from something like thirty different builders of gas and gasoline engines in this country. It would be hardly fair to quote their prices, but I will tell you that I got as much as 40 per cent. discount quoted at the first slap—I don't know how much I could get by negotiation. (Laughter.) So it seemed to us there was very little prospect of dividing up any 200 or 300 per cent. profit. As a matter of fact the prices are all broken up in the gas engine at the present moment. The subject this evening, of course, has turned on the larger sized engines used in producer gas, and really my experience is not relevant to that.

Now, instead of occupying your time talking about the oil engine, I would like to introduce, Mr. Chairman, a gentleman who came with me, Mr. Wildy, who is a member of the English Institute of Mechanical Engineers and also of the German Society, and who represents Hornsby & Sons, of Grantham, and they claim to have the best oil engine. He has something to say about oil engines and he can speak with much better authority than I can with the little experience I have had.

Mr. W. Lawrence Wildy then stepped to the platform and spoke as follows:

Mr. Chairman and gentlemen: When I came in here to-night I had no idea that I was going to do anything except listen to the paper of our friend, and I have listened to it with a great deal of interest. I have had a very considerable experience with producer gas, water gas and the ordinary gas in use in engines, that is, in England, and the figures which he has given tonight I can pretty fully substantiate, only I wish he had gone a little further into the question of the actual method of producing the gas in the producer. Most of you know, doubtless, that the producer is an ordinary cylindrical vessel lined with fire-brick, and more or less intricate in shape according to the inventor's idea of what his patent is (laughter), and with certain cooling surfaces, or heating surfaces, or conducting surfaces, or something; but you will find 150,000 patents in the patent journal, doubtless, and they have all got something about them. But the simplest producer I have ever used was a column of fuel about 10 feet high. The fuel we used in England was coke—the coke which after the distillation of the gaseous product was a residue which went to make the cost of the production of gas a mere cipher to the corporation running that gas concern. In Leeds, where I had my experience principally, the gas which was distributed through the houses cost nothing in the holder—it was all profit. (Laughter.) I have seen the figures and have gone into it with the gas chairman of the Gas Committee of the Leeds Corporation, and it is a fact that it was a decimal short of nothing in the holder. (Laughter and applause.) You laugh, but I am telling you the facts. The by-products from making the bituminous gas were so valuable at that time that they paid all the expense, interest and depreciation of plant, and the gas in the holder cost nothing but distribution and collection of accounts. Meters, of course, are charged by rent there. In proportion to the size of our meter, they charge us 18 pence or half a crown or 2 shillings, so that does enter into consideration, and inside our premises our pipes are all our own, so that the distribution costs from a shilling to 14 pence per day according to the district, and we get good gas—16 candle power gas. But at the same time we were using enormous quantities of gas for a process which we carried on in our works. I got hold of this water gas process as it was made in Germany at the time, and I saw that it seemed a very good heating medium, very cheaply produced, and we went in for a plant there. The plant was a magnificent success so far as we were concerned. It reduces our gas bill from between £6,000 and £7,000 to just over £1,000 a year—fuel, interest, depreciation, labor, distribution, everything concerned, came over just £1,000 a year, or something under one sixth of what we paid before. That gas cost us on an average about three pence halfpenny per 1,000 cubic feet. We made only water gas, but we got no by-products. In the water gas business there are no by products. You simply consume your fuel right away there in the blowing up process, or in the cooling down process, wherein you inject steam and produce carbonic acid first. That carbonic acid in going down to a lower temperature parts with its atom of oxygen and absorbs an atom of carbon, and becomes carbonic oxide, and that passes to the scrubber, where it is cleaned, and then to the holder. That was the gas with which we reduced our expenses from £6,000 to £1,000 a year. With that producer we got a gas which gave us 30 per cent. of carbonic oxide, and 5, 6 or 7 per cent. of hydrogen, and a very small percentage of the olefiant gases which were hardly valuable. After that we went in for other experimental business, and came on to the oil engine, which was the subject that Mr. Richmond has kindly fastened on me to night. In the oil engine we have a machine which works with the ordinary petroleum of commerce, that is, any of the lighting oils which are in the market. It will also work with the heavier oils up to the specific gravity of .9, and it will work with an oil having a flash point of anything that the ordinary oils have and up to 320° Fahrenheit. The continual combustion of the oil in the vaporizer restores to the vaporizer the heat which has been extracted by the vaporization of the oil and the heating of the air necessary to produce the subsequent explosion. These engines have been running continuously for two months day and night without stopping, without any hitch whatever, and the higher the work that is taken out of the engine, up to full power, the better the engine works. At very low powers the engine will want a little nursing perhaps, but at full power she will work right along. We start our engine at 5:30 in the morning and the men come in at 6 o'clock, and she is never looked at again except when the man goes in at dinner time and oils her, and at half past five when he goes to stop her, and there is no outside flame, no exposed red heat or dangerous flame of any sort about the engine.

A Member—What do you mean by nursing?

Mr. Wildy—I mean this, that if the engine has to run light for five or six hours, which I suppose no sane man would do under ordinary circumstances, it is possible that he may want to put a little brake onto the engine, or something of that sort to put a little work on her.

Mr. Holloway—Is there any residuum in the cylinder?

Mr. Wildy—None whatever. We have run her for two months and there is not as much as you could wipe off with your hand.

Mr. Oberlin Smith—What was the efficiency of the various sizes in fuel per horse power, rating the oil at the same price as coal?

Mr. Wildy—I can hardly give you that here. The consumption runs about ⅞ of a pint of American Daylight or Water White per horse power on all sizes of engines. It runs a little lower, but only a little lower, on the larger engines than on the smaller ones. The very small ones will run to a pint. There is a greater loss owing to the friction of the engine itself. I am giving you per brake horse power in that case, not indicated horse power. We sell the engine on the power which the purchaser is going to get off the fly-wheel. He doesn't care what the power is in the cylinder. He wants what he will get off the fly-wheel. A 16 H. P. engine uses just .8 of a pint.

The Chairman—Mr. Burchard, yours uses about a pound of carbon?

Mr. Burchard—Yes, sir; about a pound of carbon in the gas.

The Chairman—A pint weighs about a pound. Your ⅞ Imperial would weigh about a pound?

Mr. Wildy—Yes, that is so, sir. In Russia they are adopting these engines, and we cannot keep pace with them. With us in England it is a matter of consideration, because the oil which I understand you give about 7 cents a gallon for, costs us about 6 pence half penny a gallon. They are doing wonderfully well with the engines over there. Every class of power user is adopting them to the rejection of all steam engines up to 50 or 60 H. P. They are in the hands of stablemen, gardeners, coachmen, all sorts of people, who after they are once instructed know what to do.

Mr. Perry—How about the noise from the explosion? Is it less than from the gas engine?

Mr. Wildy—The pressures in the oil engine are rather lower. In the Scotch gas I have had as much as 210 pounds initial pressure in the gas engine. The consequence is that the terminal pressure is so high that the exhaust end becomes noisy. What is your engine pressure? (To Mr. Burchard.)

Mr. Burchard—About 180 pounds.

Mr. Oberlin Smith—About what is the price of this engine compared with the engines of like power after the 40 per cent. is taken off?

Mr. Wildy—I am afraid you have got on the wrong track. Mr. Richmond was not alluding to our engine. We do not do business that way in this country.

Mr. Oberlin Smith—We want to get the 300 per cent.

Mr. Wildy—300 per cent.—that is nearer the mark. I am much obliged to you, gentlemen.

Mr. Jesse Smith—What maintains the temperature of the generator?

Mr. Wildy—The continual combustion of the oil.

Mr. Smith—Whereabouts?

Mr. Wildy—In the vaporizer. There is no generator. It is nothing but a vaporizer.

Mr. Smith—There is a fire inside?

Mr. Wildy—No, sir; there is no fire inside. It is such a black heat that it would only just melt tin.

Mr. Smith—What maintains that temperature?

Mr. Wildy—The combustion of the oil.

Mr. Smith—But the combustion takes place in the cylinder of the engine.

Mr. Wildy—No, sir; it takes place in this vaporizer and communicates by this little narrow neck.

In answer to a question by the chairman, Mr. Wildy said further:

With gas at 2 shillings per 1,000 feet we run rather cheaper with the oil even at six pence halfpenny. The gas engine makers will tell you that they use 14, 16, 18 cubic feet to the horse power. As a matter of fact they will use 25 to 30 in regular work. But with the producer gas you will use at the very least 90 to 100 cubic feet of gas, and then you have always to provide an attendant to the producer and the steam boiler, and you have got a great deal more plant to put down for that gas engine than the oil engine. When you come to take into consideration the depreciation on the first cost and labor, you get a cheaper engine with the oil engine than with the producing gas engine.

A Member—What causes the explosion in the vaporizer?

Mr. Wildy—The temperature of the vaporizer and the compression of the mixture. There is no electric spark, no flame, no ignition tube. There is nothing after you have once started the engine but the temperature of the vaporizer. If there is any gentleman who doubts at all what I am saying to-night, if he will visit the De La Vergne Company's Works, where they have got one of these engines, Mr. Richmond will be only too pleased to let him see that engine running and show him that there is nothing whatever but the temperature of the vaporizer and the compression to produce that. To prove to you that it is the compression, we use a different amount of compression for American oil from what we use for Russian oil, and the engines are all adapted so that you can make an engine here to day and use it on Daylight oil and send it to Russia to morrow, and by altering it in a little matter, which will take perhaps seven minutes, you can use it with Russian oil. The Russian oil requires 25 to 30 per cent. more compression than the American oil.

The Chairman—Have you determined the temperature of the ignition there with the power you are running at?

Mr. Wildy—It does not matter what the temperature is provided it is not below 400. We find that at 400 degrees, the melting point of tin, we could start any engine with any oil.

Mr. Holloway—As we understand it, the oil lies in the vaporizer until the compression raises the temperature.

Mr. Wildy—No, sir. The instant it is in the vaporizer it is vapor, because our vaporizer is at black red heat. The compression will increase the temperature a little, of course, but it will not be a very great matter. We put a block of tin on there; the moment that melts, that is the proper point to start the engine.

A Member—I would like to ask one question which seems to bear on the subject. I would like to ask the amount of cooling water that is required to cool the cylinders of the gas engine.

In some localities, with large powers, I should think that would cut quite a figure in running expenses.

Mr. Burchard—In this case we circulate the water through the cylinders—the water contained in the holder tank of the large gas holder—in winter. In summer we pump the water from the stream that flows near by, so we do not measure it. I have measured it, however, and I have some notes here and could look it up if you wish.

Dr. Emery—There is one question that I think ought to be brought out here—what was the actual cost of horse power in this particular case that is so ably presented by Mr. Burchard? I do not know but I made it up too hastily here; I would like to be corrected if I have, and it would interest others to know if I am right. There is 160 watts per pound of coal—159.6.

Mr. Burchard—Allowing for the 20 per cent. for the fuel used for making steam the average was 159.6.

Dr. Emery—Calling it 160 and 746 for a horse power, it makes 4.66 pounds per horse power per hour for the work delivered out of the line to the lamps. Now for efficiency of plant from the lamps back through the dynamo and the gas engine of 80 per cent., as we would usually allow, that would make the cost per indicated horse power $3.72. It does not seem to me a very remarkable result; it is about what we get for the high pressure engine, if the way this is figured is right.

The following written discussion was contributed by Mr. Paul Winand, Superintendent of the Otto Gas Engine Works, Philadelphia:

Philadelphia, April 11, 1895.

MR. F. R. HUTTON, Secretary A. S. M. E.

DEAR SIR: I had the pleasure of being present at the meeting of your Society last night, and would have asked for the privilege of making a few remarks on the subject as a representative of the Otto Gas Engine Works, had it not been for the lateness of the hour at the close of this very interesting discussion. May I be permitted to offer these remarks in writing as a supplement to the discussion?

It was a pleasure for me to add my share of applause after Mr. Reeves's very able exposition of the subject. I fully concur with the same except on a few minor points.

Concerning gas lighting by incandescent burners, I know by actual experiment that the temperature obtained from producer gas is not sufficient for the purpose. On account of the large percentage of inert gases which it necessarily contains it is not even economical to enrich it for lighting purposes. However, by reason of the cheapness of the power obtained from this gas, electric lighting is generally the best possible way of providing light in such an installation.

Pure water gas, though it can well be used in incandescent burners, is more expensive per heat unit, and on the whole can not compete with producer gas.

It is generally thought that by increasing the number of impulses the gas engine can be greatly improved as far as regularity of motion is concerned. This is only an argument of relative value, however, as the question resolves itself to this: Whatever the number of impulses may be, there must be fly wheels of sufficient momentum to produce the desired degree of regularity. Now is it cheaper, more economical and generally preferable to have a simple engine with a large amount of momentum, or a more complicated one with smaller fly wheels? The same regularity can be obtained in all cases, and it has not been proved that a simple engine of sufficiently high speed is not the more preferable solution. A considerable experience in this line has shown to me that it would be decidedly wrong to complicate the construction in order to get more than one impulse for each revolution. I should wish to emphasize the point made relative to the use of fuel gas for industrial heating purposes concurrently with its use for power. The advantages of gaseous fuel when applied not only on a large scale, as for metallurgical operations, but in smaller apparatus of various kinds, are being gradually recognized.

The engines at Danbury, so carefully tested by Mr. A. Burchard, were built by the Otto Gas Engine Works with the provision, as he has stated, that they could be operated indiscriminately by producer gas or by illuminating gas. The latter gas having about six times the heating value of the former, it will be easily understood that a compromise had to be resorted to in the construction, the result being that the engines do not give the best possible efficiency in either case. Engines built solely for producer gas would give better results. A test of a similar engine has been made by Prof. Spangler, and was published in the Journal of the Franklin Institute, May, 1893. These engines were designed in 1891, and naturally engines built to-day show a marked advance in construction as well as in economy.

Since steam is being used in the Danbury plant for various purposes it was quite natural to employ a small steam engine for starting the gas engines. The large engines built now by us are provided with a self-starting device which renders the use of auxiliary power unnecessary, and greatly enhances the convenience of operating the plant.

The efficiency of a plant depends on the choice of the units of power, and perhaps a better result could be obtained in this case if the units were differently selected.

It should also be borne in mind hat the producer used is large and would be capable of furnishing gas for a greater amount of power, especially if the load factor was more favorable, as it would be, for instance, in the operation of a mill or of a water works, and I might well state here that gas power is being used extensively in Europe for the last named purposes. The assumption made by Mr. Burchard that 25 per cent. of fuel should be allowed, that is, added for the production of steam, is rather too high. In numerous tests made abroad the coal used for steam was found to average about 12 per cent.

Up to this date it has been customary to use a steam boiler in connection with the producer. This is not necessary, however, and we operate in our works a producer plant without boiler. The necessary amount of water vapor which passes with the air through the producer is generated at atmospheric pressure by means of the waste heat of the gas as it leaves the producer. There is thus no additional fuel used for producing steam and besides the operation of the apparatus is rendered almost automatic.

Mr. Richmond has stated that oil engines were not made in this country, that they were in fact hardly known Such engines have, however, been manufactured here for several years, and considerable efforts have been made for their introduction. We ourselves are fully prepared to begin their manufacture if a sufficient demand should arise. But in view of the fact that gasoline engines are so much preferable in most every respect, it is not surprising that the demand for oil engines should be so small. Gasoline engines have all the advantages of gas engines, and in some of those built in this country to-day the provisions for safety are so absolute that the insurance companies have no objection to their use. Besides the objectionable smell which seems inseparable from the oil engine, there is the objection of its not being ready for starting at a moment's notice. Oil engines are naturally wasteful when running at partial and variable load. This is due to the fact that the proper degree of temperature is not maintained at the different loads which occur in practice. When a continuous external flame is used for maintaining this temperature, the fuel consumed in this flame decreases the efficiency at reduced loads.

The oil engine described by Mr. Wildy was exhibited at the World's Fair. In this engine, the ignition of the charge depends on the temperature of the chamber which is left uncooled at the rear. The temperature of this chamber, and consequently the time of ignition, varies with the load, and this circumstance produces an additional variation of the efficiency with the load.

Oil engines are naturally somewhat more complicated, more expensive and less convenient than gasoline engines, and unless there be a marked difference in the prices of the two fuels the latter would seem preferable in most cases.

As a conclusion, I would remark that all those actively engaged in the development of internal combustion engines cannot fail to feel gratified at the increasing interest which is manifested in this subject and of which yesterday's discussion was a remarkable instance. Very truly yours,

PAUL WINAND.

London Notes.

(From our London Correspondent.)

AMSTERDAM EXHIBITION.

At this exhibition, which was opened on the 10th inst., one of the principal features among the exhibits is an electric restaurant, where the services of waiters are dispensed with, the guests being served by means of electrical contrivances. Many of the latest electrical inventions are exhibited.

ELECTRIC TRACTION.

There is at present a decided move in favor of electric traction. Works are in hand for tramways at Coventry, Dublin and Bristol, while Leeds is thinking of important extensions of its system and many other towns are considering proposals to work electric tramways who would not have looked at the matter a little over twelve months ago. The Bristol line will be on the Thomson-Houston system, the British company having the contract, and in a few weeks everything is expected to be complete. There is a tendency among railway companies to let electricity supersede steam on their lines, notably the Mersey Company, who anticipate largely increased receipts through the proposed innovation. Our larger railway companies give no thought to the question, neither do they seem at all likely to do so.

TELEPHONE SERVICE.

For the past few weeks a Parliamentary Committee has been sitting to hear evidence from experts, electricians, local authorities and others as to the efficiency or otherwise of our present telephone service, and as to whether it is advisable for the Government to purchase the whole telephone system and rights of the National Telephone Company, which company owns nearly the entire system of telephonic communication in this country. We shall doubtless have the whole in the hands of the Government before a great while has passed, but a pretty penny will have to be paid, for the system has only reached its present dimensions through strict superintendence and enormous expenditure.

The Waddell-Entz Factory Sold.

The Waddell-Entz factory at Bridgeport has been sold by Judge J. H. Perry for $60,000 to Percival Knauth, a member of the firm which was the chief backer of the original enterprise.

RAILWAY PATENT LITIGATION.

(Continued from Page 265.)

may be kept up between the wire and a *projection* from a running train or car, and upon each train I have a car containing a battery, a receiving and transmitting telegraph instrument and *a swinging or projecting device* by which the circuit or connection may be formed with the main line."

(4) Guyard British Patent. This is also for "Improvement in railway telegraphs," and discloses a conductor suspended over the train and communicating with the apparatus carried thereby by means of a contact device or "communicator" mounted on top of the car. The date of this is 1855. The "communicator" is referred to in the provisional specifications as follows :

"On the tender or engine or one of the carriages of each train is *a projecting* arm carrying two metallic brushes. By this or other suitable means a connection is made between the wires and one pole of the galvanic battery or other source of electricity on the train, the other pole of which battery is connected with one of the axles and through it with the earth."

(5) Clark British Patent, date 1878, is for a railway telegraph and describes a stationary conductor arranged in any of three different ways—below, at the side, or over the top of the car. When below, the contact device is an overrunning shoe secured to the end of a trailing spring-pressed arm; when at the side, it is a flanged roller mounted in a fork on the end of a vertical arm which is pivoted to one end of a pivoted lever extending into the car, which lever is provided with a weight on the other end for causing the contact roller to bear upwards against the under side of the suspended conductor. Provision is made for the lateral movement of the conductor by making the conducting roller long enough. When placed above the car the latter construction is also used.

(6) Dalstrom's British Patent of 1880.

This patent is for a railway telegraph. It has a conductor suspended above the train, and a contact arm mounted on the train carrying a grooved contact roller making an underrunning contact with the conductor. The specification is :

"The conducting wire, supported (properly insulated) by arms from the telegraph poles, or in any other way, is freely suspended the whole way between the stations at as nearly as possible a uniform height above the rails, and equally distant throughout (or as nearly as may be) from the center of the line of the railroad track. . . . If there be several railway lines side by side, the wires may be supported on cross-pieces situated above and crossing the rails, said cross-pieces being supported by a sufficient number of poles. . . . . The wire may be arranged either in line with the central line of the track or at a greater or less distance therefrom."

(7) Swears's British Patent (1866) is for improvements in railroad telegraphs, and describes a conductor extending along the track in several different positions and several different forms of contact device. The conductor is described as a bar or rod of metal placed on or hung from insulated supports ; the height of the insulating supports of the conductor "can be from a few inches to any height, and can be supported over the train if necessary."

The contact arm is thus described :

"To form an electric communication between this supported rod, bar or wire and the train, there is fixed at the side or end of the carriage a socket in which an arm is adjusted, which arm projects from the carriage over the supported rod, or the arm may be fixed on or over the grease box of the axletree, *or any other suitable place.* This arm can be made adjustable so as to regulate the distance of its projection."

The contact device is thus described :

"At the end of the arm over the supported rod is an axle; on this axle are one or more rollers or wheels insulated on the arm, and a connecting wire brought from them into the carriage; *these rollers or wheels trail along the rod, either above, under, or at the side.*"

And again :

"These wheels can be simply mounted on the axle at the end of the arm (insulated), and a contact wire brought from them into the carriage, and rendered self adjustable by means of the arm and axle."

(8) Tatham's British Patent of 1882 is for a railway telegraph, and discloses a conductor mounted upon insulated supports between the rails of the track. Communication is made with the train by means of a trailing arm pivoted to the under side of the car and which is provided with a spring for pressing it down against the conductor and a grooved roller which makes contact with the upper side of the conductor.

(9) Traill's British Patent of 1883. This patent is for an electric railway in which there is the single independent conductor for supplying current to the car, the rails being used as the return conductors. The contact device consists of an arm projecting laterally from the side of the car and capable of being adjusted to any length of projection. The supply conductor is arranged on low posts at the side of the track, and the contact device consists of an elliptic spring which bears against the conductor, making contact therewith either on its under or its upper surface as may be desired. The inventor says (p. 2199, l. 22) :

"According to my invention, to enable the contact brushes to travel along such conductor with the least amount of friction while preserving metallic contact, and to adapt this to the varying loads in the cars, and to automatically adjust themselves for either direction of motion, and to rapidly slide off and again to mount on to an electric conductor where interruptions of the same occur with the least chances of breakage, I employ in lieu of and in preference to either wire brushes or roller wheels, 'a contact brush,' which, in its simplest form, is a double curved and elliptical or semi-elliptical steel spring, shaped like a carriage spring, formed of thin but broad spring steel in one or more leaves, and furnished with a shoe or contact wearing piece at the place of rubbing contact. The brush is attached to a metallic arm projecting from the side of the car and capable of sliding in or out, being held by a spring catch or screw when drawn out to the requisite distance or of folding up or back when not in use."

And at line 46 of page 2198 :

"The brush is capable of attachment to the projecting arm so as either to press down upon the top surface of a contact rail, as in Fig. 2, or so as to press upward against the under side of the conductor rail, as in Fig. 4, or it may be used for a side pressure."

(10) Lake's British Patent of 1884. This patent is for improvements in railroad signaling and stopping apparatus for preventing collisions on railways. It discloses a conductor arranged above the train and a contact device mounted on top of the train spring-pressed upwards against the conductor, whereby the current is conveyed into the train to operate the signaling device or a contact-closing device which will throw into circuit electrical devices for stopping a train. The patent also states that the conductor may be arranged at the side of the train or between the rails below the cars. The contact apparatus has four contact pieces, two of which are brushes and two rollers, the said contact pieces being mounted upon an arm sustained by a spring in the middle so that two of the contact pieces are back of the supporting point and therefore trail along the under side of the overhead conductor.

(11) Bolton's British Patent of 1885. This patent, dated May 21, 1885, is for lighting railway carriages in tunnels and underground railways. It discloses a line conductor suspended from the roof of the tunnel, and a trailing contact arm pivoted on top of the car and provided with a contact device making an upward spring-pressure contact with the under side of the conductor. The specification says (p. 2232, line 25):

"On the roof of the tunnel, and supported by brackets or hangers, I fixed metal conductors at such a height above the rails that the brushes or grooved wheels on the carriage roofs will either rub or roll along them when the train passes through the tunnel. . . . The conductors are connected to the hangers or brackets in such a manner as to be insulated from them and as to present a smooth under surface."

Several different forms of contact device are described in the specification, and two forms are illustrated. The first illustrated form is described as follows :

"The construction of the collectors is shown to an enlarged scale in under view and side view at Figs. 2 and 4. They consist of a copper strip *c*, held by metal clamps *d* on upright bars d^1, pivoted at *e* to metal plates *f*, screwed to insulating plates *g* of earthenware or other material, and fixed on the roof of the carriage, the collector being held in the upright position by helical conducting springs *h* connected thereto, and to insulating blocks *i*, also fixed on the carriage, the electrical connection being made between these ends of the springs and the conductor leading to the lamps in the carriage. By this arrangement it will be seen that *when the conductor* c *comes in contact with the conductor* a, *it can be depressed thereby in a more or less inclined position, the springs* h *maintaining the contact between the two, notwithstanding any vertical oscillation of the carriage.*"

This particular contact device is made wide so as to permit of lateral movement between the contact device and the conductor without breaking contact.

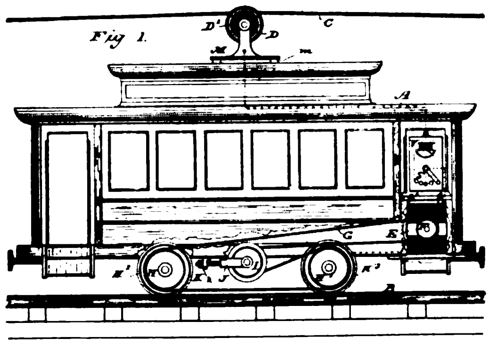
A second form of contact device consists of an arm pivoted so that it may assume an inclined position, as in the case with the first construction. It is, therefore, a trailing arm, and is surrounded with a helical spring which presses it upwards against the conductor, while the plate springs R R, one on each side, serve to hold it in a vertical position against its lateral movement. It has not only an upward spring pressure tending to maintain it in contact with the conductor, but also spring pressure from both sides tending to counteract its lateral movement. This device is a pivoted trailing upwardly spring-pressed arm, capable of both vertical and lateral movement, and it complies in every particular with the contact device described in Mr. Bentley's definition of Van Depoele's alleged primary invention with the exception that it is not used to convey current to propel the car.

In short, the defence claim the Bolton patent discloses a "railway having an overhead conducttor and a car for such railway provided with a contact device carried by the car so as to form a unitary structure therewith, and consisting of a trailing arm hinged and pivoted to the car so as to bridge the space between it and the conductor and move freely both laterally and vertically, the said arm carrying at its outer end a contact device capable of being pressed upward by a suitable tension device into engagement with the under side of the conductor," and is therefore a complete anticipation of Van Depoele's said alleged primary invention as defined by Bentley and set forth in the patent, 495,443, in suit.

Daft's prior use at Baltimore. The defendants introduced the testimony of Leo Daft to show that he used at Baltimore a contact device essentially the same as that described in the patents in suit; that Van Depoele's devices were essentially the same as those described in Siemens's 1880 patent. They also claim that Van Depoele was not at the time of his patents trying to solve the problem of efficient contact, but was trying to adapt the Van Depoele dynamo to use as a motor; that the contact problem had already been solved and cut only the most insignificant figure in the whole transaction.

They claim that there is no credible evidence that Van Depoele invented the upwardly spring-pressed swinging and pivoted underrunning trolley before March, 1887, the date of his application for No. 495,443.

Summing up, the defence claimed to have shown the ample art which preceded the commercial introduction of electric railroads from which inventors might select suitable means of taking the current from the conductors, and that Daft, Sprague and Hunter did select upwardly spring-pressed arms of the trailing form. They claim that Van Depoele, even as late as 1886, 1887 and 1889, used the overrunning trolley at Montgomery and elsewhere; that the underrunning trolley was due more to the substitution of the single overhead wire, which was less adapted to overrunning than the double wire and cheaper, than to any other one thing; that patent No. 495,443 is void because the same invention was patented in prior patents to the same inventor, by which the right to patent was exhausted.



The patents here referred to, Nos. 331,585 and 467,448, are illustrated in the above cut:

In this device the wheel D has a grooved metallic rim set upon a flexible rubber web which permitted slight lateral motion, and journaled upon bearings resting upon springs permitting of slight vertical motion.

The substance of the answer to this defence is that none of the patents prior to those at suit covered the essential features of the Van Depoele invention which permitted the extremely wide variations, both laterally and vertically, amounting to a complete reversal of the position of the trolley pole when desired. It is claimed by the complainants that there was nothing in the state of the art at the time of the Van Depoele patents that would suggest his invention, and they refer to the evidence of defendant's experts, Brevoort and Waterman, as admitting that Van Depoele's work was new.

In regard to the Wesson and Fitzgerald patents, they hold that they do not show a spring upon the *outer* end of the arm, but on the contrary that they show the spring between the pivotal device and the contact device. Smith's patent does not show the arm on the under side of the conductor but on the side of the conductor nearest the car. Brunnin's shows underneath contact with an overhead conductor, but his conductor is not continuous and no swinging arm is described. Guyard's shows arms, but the spring is at the contact end and not at the opposite end; there is no swinging arm and no substantial capacity for adaptation to *material* changes of level.

In the Wesson patent the wheels are not mounted on a swinging arm.

The Fitzgerald patent is vague and indefinite, and nothing is said in the specifications about any capacity for movement. The complainants interpret the specification very differently from that placed upon it by the defence.

As regards the Bolton patent, they hold that it is not early enough in point of date, viz., Feb. 20, 1886. (This was date of final specification; it is not known when the patent was sealed.)

Further, it is claimed that it does not cover Van Depoele's invention, as while there is a suggestion of the substitution of some grooved device and there is a possibility of slight capacity for lateral and vertical motion, it does not meet the requirements in the extent of these; and still further, it is not for *propulsion* purposes as claimed in the patent in suit. Bolton clearly had no swinging arm and nothing that would enable a car to take switches or crossings, or to maintain contact at curves.

Edison never got beyond the third rail.

Dr. Werner Siemens appreciated the overhead system and exhausted his ingenuity in the variety of devices which he adopted to secure efficient contact by overrunning, side-pressing or slotted-tube devices.

Daft approached the direction of Van Depoele's at road crossings but failed to embody the swinging arm feature, and then failing to see any possibility of further development in that direction, turned his attention to overrunning or towed trolleys.

Sprague, it is claimed, probably adopted his final ideas from Van Depoele.

The defence concluded as follows:

I. That the Van Depoele patent No. 495,443 was anticipated by the prior American and British patents before enumerated; by Parish & Munn's patent No. 297,438, dated April 22, 1884; by Parish & Munn's patent No. 320,495, dated June 23, 1885, and by Heald patent No. 385,928, dated July 10, 1888,—all of which specify contrivances claimed to be essentially the same as Van Depoele's.

II. That the patent was anticipated by the prior use by Sprague at Richmond.

III. That in view of the state of the art its claims did not involve invention.

IV. That the following prior patents of Van Depoele's embodied the same invention: Patents 394,087, 405,750, 408,638, 422,266, 424,381.

The court room looked like a veritable toy shop at Christmas time. Nearly, if not quite all of the devices mentioned in the above report were represented by models of cars with the devices attached showing their method of application to the stationary conductors. There was also a model of a portion of the Winchester Avenue Railroad, showing a double track, a cross-over, the overhead wires and feeders, and two cars, labeled "Short" and "Westinghouse," with their trolley poles.

Historical exhibits of the trolley actually used on the New Orleans road in 1885 (Van Depoele) and of the one used at Montgomery, and several more modern ones, were features of the exhibits for the plaintiffs.

Strange to say, this case seemed to have no interest for the public, as there were few present besides those who were actually engaged in the case. Stranger still, of all the electrical papers that claim to keep their constituents posted as to what goes on in the electrical world, *not one* was represented but ELECTRICITY.

Counsel in the case were Betts, Hyde & Betts for complainant and Jenner, Kerr & Terry for defendants.

For Mutual Protection.

Independent Telephone Companies Organized.

A meeting of the independent telephone manufacturing companies was held in Chicago this week for the purpose of organizing an association for the advancement and benefit of the legitimate telephone business. Mr. J. E. Keelyn, president of the Western Telephone Construction Company, was instrumental in bringing about the meeting, his call to arms being sounded in the following telegram:

Can your managing official meet here with others, to perfect national organization for mutual protection, next Saturday and Monday. Important immediate action. Answer quick. Confidential.

Confirming the telegram and urging still further the necessity for united action, Mr. Keelyn sent the following letter:

The probable effect that will obtain in the future respecting the form of order to be entered by the United States Court of Appeals in the Berliner case at Boston requires the earnest and urgent attention of all those expecting to be engaged in the manufacture or production of telephone apparatus.

The further necessity for preparing for the promised onslaught of the Bell people calls for immediate organization toward a peaceful conduct of legitimate telephone business, and the maintenance of the legal and business rights of those engaged in it.

This has suggested the prompt meeting of interested parties. If you desire to be identified with this organization it will give the writer pleasure to have your prompt advices to that effect.

It was deemed unwise at this time to make the convention open to the public, but it is expected and hoped that the result of the conference will be conducive to the enterprise of free ingenuity and the material advancement of legitimate telephone business.

The National Association of Telephone Manufacturers was officially formed on Monday, May 27. The officers elected were as follows: President, J. E. Keelyn, of Western Telephone Construction Company, Chicago; first vice-president, J. R. Johnson, Viaduct Manufacturing Company, Baltimore; secretary, Paul W. Bossart.

American Institute of Electrical Engineers.

The annual meeting of the Institute for the reception of the yearly reports and election of officers was held at 12 West 31st street, New York, May 21.

The Council reported a membership of 944, showing a net gain of 144 members for the year ending April 30, 1895.

The count of letter ballots, completed at midnight, gave the following result:

For President—Dr. Louis Duncan, Baltimore, Md.

For Vice-Presidents—Dr. Michael I. Pupin, New York City; W. F. C. Hasson, San Francisco; Angus S. Hibbard, Chicago.

For Managers—Carl Hering, Philadelphia; Bion J. Arnold, Chicago; Charles F. Scott, Pittsburg; Dr. Cary T. Hutchinson, New York City.

For Treasurer—George A. Hamilton, New York City.

The discussion of Prof. Anthony's paper on "Underwriters' Rules," read April 17, was resumed, and opened by Prof. W. L. Puffer, of Boston.

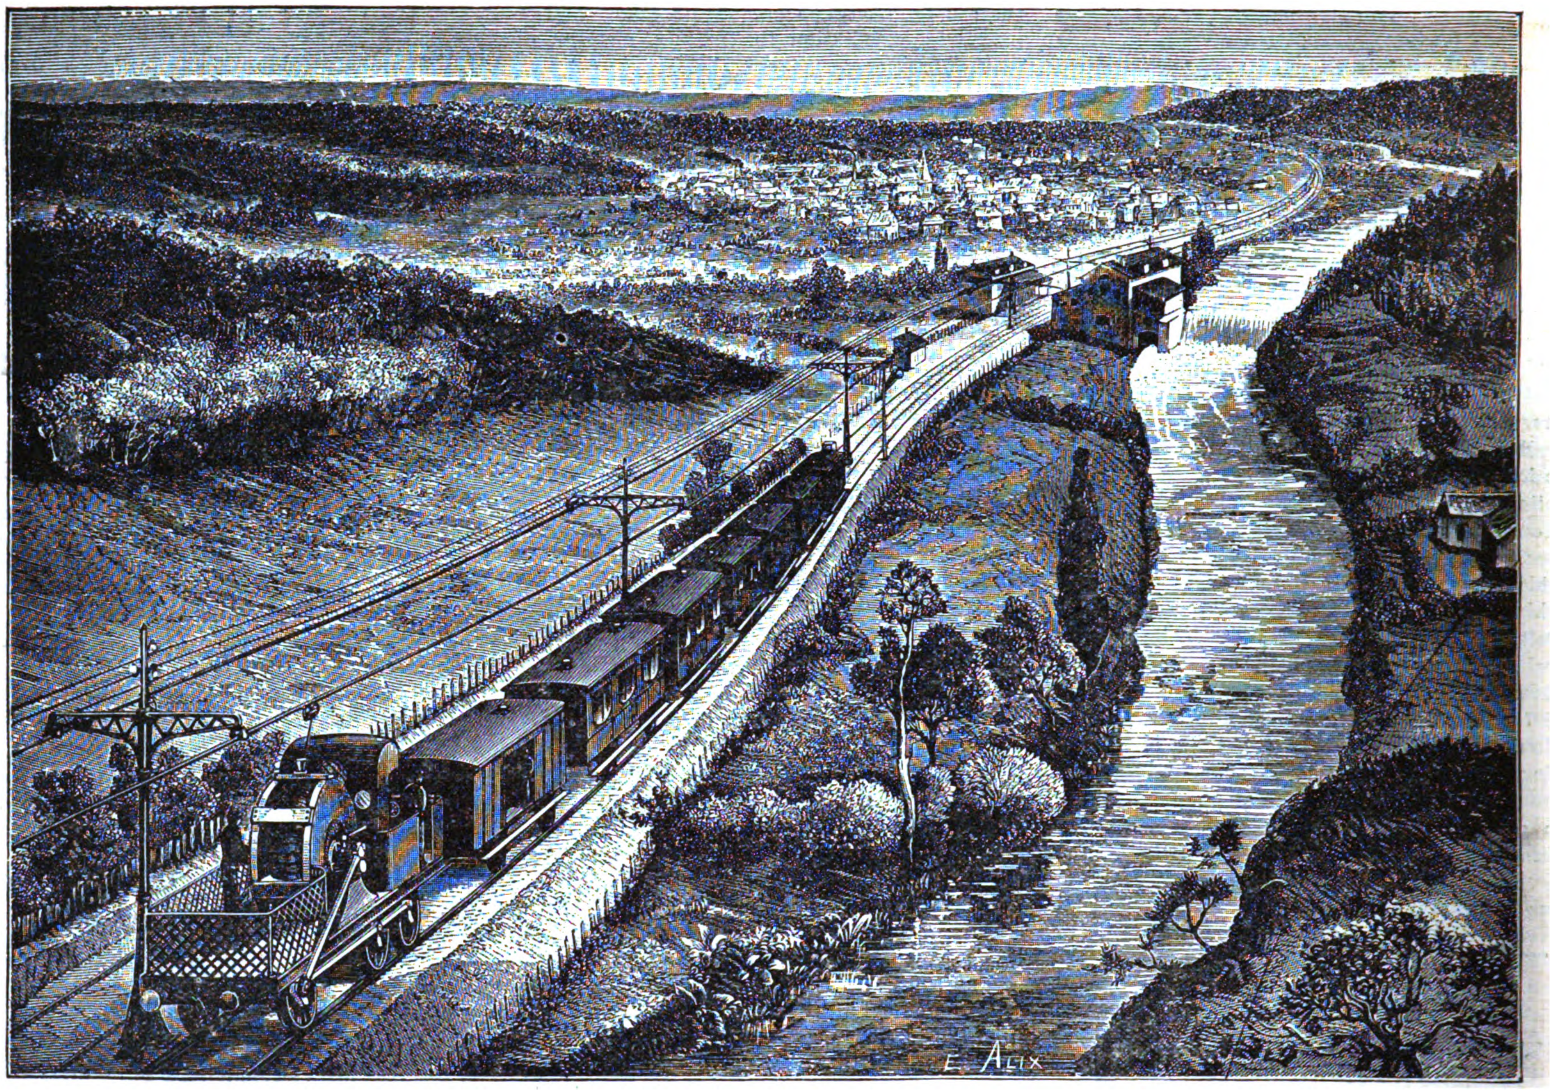
At the meeting of Council in the afternoon the following associate members were elected:

William C. Andrews, Alexander B. Simpson, Frank W. Roller, Brooklyn, N. Y.; Clare F. Beames, Myron E. Canfield, Sydney Hogentoren, New York City; John Thomas Dewar, Antwerp, Belgium; William David Gharky, Philadelphia; Henry Banks Henderson, Ithaca, N. Y.; Theodore K. Jackson, Chicago; Norman T. Wilcox, Seneca Falls, N. Y.

The following associate members were transferred to full membership:

Romaine Callender, J. Day Flack, F. R. Colvin, New York City; Russell Robb, V. M. Berthold, Boston; Herbert Lloyd, Philadelphia; Harry Hartwell Blades, Detroit, Mich.

The Council decided that the General Meeting at Niagara Falls should be held on June 25 to 28 inclusive.



AN UNDERRUNNING TROLLEY OF 1884.

The Siemens road between Frankfort and Offenbach. Contact running in slotted conductor.

THE GRAND CENTRAL PALACE.

Proposed Exhibit of the N. E. L. A.

Last week marked the close of the annual Food Show at the Grand Central Palace which had been attended by thousands daily for several weeks. The exhibitors were more than pleased with the success of the exhibit.

The dinner given by Mr. Mestaniz, the manager, to the Executive Committee of the N. E. L. A. attracted the attention of the entire electrical fraternity to the building, and it has been carefully inspected by all those interested in the movement to hold a grand electrical exhibition here in 1896. But one opinion has been expressed, and that is that the Grand Central Palace offers advantages for such an exhibition equalled by no other building in this country. We have no doubt that everything will be arranged properly, and that the N. E L. A. will make a thorough and substantial success of the 1896 meeting in New York.

If it is finally decided that the Association has no legal right to conduct an exhibit, it is proposed by a number of New York gentlemen to incorporate an exhibit company under the laws of this State, for $5,000 or $10,000, offering the stock to the trade generally; then to begin work on the grand exhibition early in September. Under this arrangement, the Association would incur no liability, but would have the use of the great hall in the building free of charge, and would receive a handsome percentage of the profits from the sale of space, the Association appointing one of its officers to co-operate in the work of placing the exhibition upon a proper basis.

TELEPHONES FOR TEXAS RANCHMEN.

Wire Fences for Pole Lines.

A paragraph has recently been going the rounds of the electrical and daily press purporting to give reliable information respecting the use of barbed wire fences in the Western States as telephone lines. There has recently been formed at Dallas, Tex., the Texas Telephone and Electric Supply Company, which will devote much of its attention to this work. In a communication to ELECTRICITY Mr. W. H. Thacker, general manager of the company, gives some very interesting information touching the methods by which wire fences are to be utilized for telephone purposes. He says:

"Few people not resident in the West have any conception of the extent of a large cattle pasture. For instance, it may be stated that by continuous running it takes a Fort Worth and Denver Railroad train from 4:30 to 10 A. M. to pass through the Goodnight ranch in Northwest Texas. This is not so large as other ranches, among which may be mentioned that of the Copital Syndicate, which is 300 miles in length.

"Poles being so high priced, and the distances to be covered so great, it would be utterly out of the question to establish an extensive telephone service among the ranchmen. We purpose using the wire fence already erected, thus obviating both the necessity and expense of constructing independent pole lines. For short lines, not exceeding a few miles in length, we simply connect the 'phones to two of the fence wires, one for the outgoing and the other for the return side of the circuit. On long lines the staples holding the wires to the posts are drawn out and the wires fastened to the posts by brackets and insulators. At every ranch or tenant house a loop is run in and connected to an instrument, the whole ranch being connected on one side of the circuit, a second wire being used for the return, thus forming a complete metallic circuit. Grounds are established at points where instruments are connected in circuit, but on only one side of the circuit.

"In addition to affording a means of quick communication with all parts of a large ranch, this form of telephone service will provide an excellent means for testing the condition of fences. An open circuit will cut off the telephone communication and at the same time indicate a break in the fence."

The company of which Mr. Thacker is manager will do a general electrical contracting business, but will devote special attention to telephone installations. The general plan will embrace the organization of companies owning all, or at least the controlling interest in, the local enterprises.

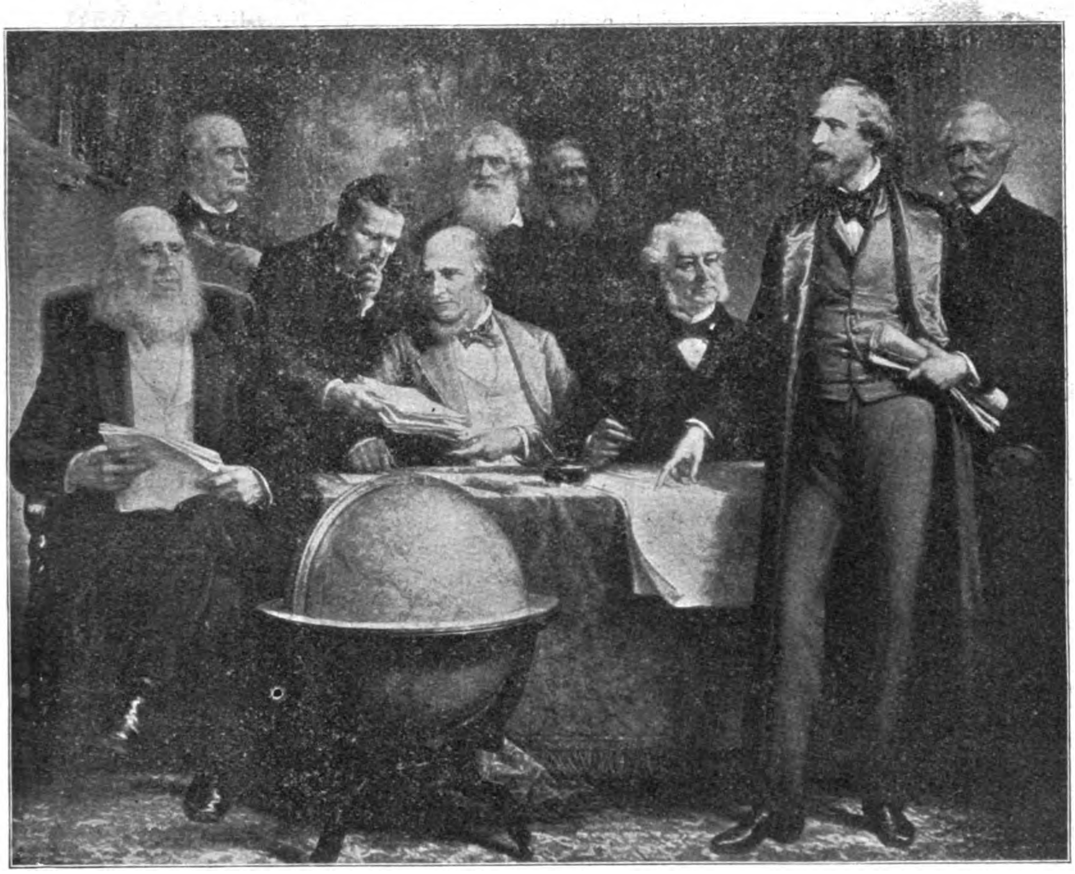
Electric Lighting Contracts.

One of the bills passed during the closing hours of the New York Legislature, and which has since received the signature of the Governor, provides:

That any incorporated village may contract for a term of one year or more with any electric light company organized under the laws of this State or with any person or persons for lighting the streets and public grounds of such village. The amount of such contract agreed to be paid shall be annually raised as a part of the expenses of such village and shall be levied, assessed and collected in the manner that other expenses of such village are raised, and shall be paid over to such electric light company, person or persons by such trustees according to the terms of any such contract. And any such contract entered into by the Board of Trustees of any village shall be valid and binding upon such village; providing, however, that no such contract shall be made for a longer period than five years, nor for a greater sum in the aggregate than $2.000 per annum in a village of less than 4.000 population, nor more than 1½ mills per annum for every dollar of the taxable property of such village, according to the last preceding assessment roll, nor for a greater sum in the aggregate than $4.000 per annum in a village of more than 4,000 population, nor more than 2½ mills per annum for every dollar of the taxable property of such village according to the last preceding assessment roll, unless the proposition for the same be submitted to a vote of the electors of such village, and approved by the majority of the voters entitled to vote and voting on such question at an annual election or at a special election duly called.

PROJECTORS OF THE ATLANTIC CABLE.

A special meeting of the New York Chamber of Commerce was held on Thursday last to formally receive the painting entitled "The Projectors of the Atlantic Cable," presented to it by fifty-two of the leading citizens of New York. Morris K. Jesup, chairman of the special committee having the matter in charge, presented the painting to the Chamber in an appropriate speech. Dr. Chauncey M. Depew delivered the oration, paying a glowing tribute to the memory and achievements of Cyrus W. Field, Moses Taylor, Marshall O. Roberts, Wilson G. Hunt, Prof. S. F. B. Morse, Chandler White and David Dudley Field.



The Projectors of the Atlantic Cable.

D. D. Field. S. F. B. Morse. Daniel Huntington. Wilson G. Hunt.
Peter Cooper. Chandler White. Moses Taylor. Marshall O. Roberts. Cyrus W. Field.

The painting represents a meeting of the projectors of the Atlantic cable at the residence of Cyrus W. Field in Gramercy Park. The venerable Peter Cooper is presiding. To the right stands Mr. Field, who is calling attention to a chart of Trinity Bay, pointing to Heart's Content as a safe harbor for landing the cable. David Dudley Field stands behind the president with a law book. Chandler White is handing estimates of expenses to Marshall O. Roberts, next to whom at the table is Moses Taylor. At the end of the table stands Wilson G. Hunt. Prof. Morse is standing behind Mr. Roberts, and by his side Daniel Huntington, the artist, sketching. The original idea of the picture was suggested by Mr. Field to Mr. Huntington shortly after the completion of the cable.

Milwaukee Street Railway Co.

The street railway system of Milwaukee is at last compelled to acknowledge bankruptcy and to go into the hands of a receiver. It is bonded for $12,800,000. The G. E. Company holds $325,000 and the Street Railway and Illuminating Properties $600,000. Interest has been defaulted four times.

The system is equipped chiefly with Sprague apparatus, and to put the road into good condition will require a large amount of fresh capital.

BOOK REVIEWS.

The Keely Motor Explained by Its Inventor, with Running Comments by the Editor.

Operation of the Vibratory Circuit (by Polar and Depolar Sympathetic Interchange as Associated with the Transmitter). By John W. Keely. ("New Science Review" for April.)

Keely, it will be remembered, is the irrepressible fraud that for twenty five years or more has been periodically coming before the public with new schemes of perpetual motion, or for drawing energy from sources where it does not exist. These schemes are never twice exactly alike, but all have gone under the generic term of the "Keely motor." The writer well remembers that in 1877 he saw at the Chester Steel Works several iron or steel spheres. One was about 3 feet in diameter, and two others about 1½ feet. These were very nearly solid, so he was told, but but had small cavities at their centers which communicated with the outside by a narrow channel, perhaps as large in diameter as a lead pencil. On inquiring for what purpose they were made, he was told that they were for the Keely motor. They had been tried, but Keely claimed that they were not strong enough to hold his "vapor" and had returned them. They had not been paid for.

At that time Keely claimed that he used a vapor, and the only bar to his successful accomplishment of the feat of running an engine from New York to San Francisco on a thimbleful of water was his inability to obtain a containing vessel for his "vapor" strong enough to hold it.

Evidently the Keely motor of to day is not the Keely motor of that day, for in the article under review he gives the following very lucid (?) description of the new apparatus, which evidently requires no containing vessel of unattainable strength, as did the older one, unless it be something very strong to hold the "ring of less diameter, situated inside of the larger ring and carrying on its face *eight* disks, with a triple grouping in each," which he states constitutes the "depolar field, or field of high polar interference."

Continuing his description of the apparatus, he says: "In the center is placed a resonating intensifier, through which the sympathetic currents pass. By a spiro-vibro phonic [sic] arrangement these currents are diverted toward the neutral center of the earth. This device is the sympathetic multiplying agent for the polar field, and the negatizing agent for the anti-polar field. When under action it is entirely subservient to the transmitter, both in regard to high intensification and thorough neutralization of polar and depolar interchange."

Here we have the whole thing in a nutshell, so concise, so clear that none but John W. Keely, Mrs. Bloomfield Moore, or J. M. Stoddart could equal it in style.

But the simple description of the apparatus in which eight disks are given a "triple grouping," is nothing compared with the philosophy of its action.

Here is part of it:

"The circles containing the sensitized disks—both polar and depolar—are in sympathetic relation to the polar negative circuits of the earth. . . . The sympathetic conditions of the polar and depolar fields of the circuits remain latent until the transmitter is associated and the introductory impulse given. . . . The introductory impulse represents the sympathetic chord of unity to polar attraction. When this is given the polar outreach [What t'ell's a polar outreach?] is immediately established in the polar circuit which seeks to assimilate itself to the anti-polar, or triple groupings; but as the alternation of the two circuits represents a condition of sympathetic antagonism [as 8 is to 9]. [*Sympathetic antagonism* is good.—Ed.] an intensified differentiated wave motion is induced between [Again in the classic language of Chimmy Fadden, "t'ell wid sympathetic philosophy."—Ed.] the two." . . . "In sympathetic philosophy the polar circuit represents the brain power of the instrument, or the medium of impregnation from celestial radiating outflow."

We are not much "up" in physiology, but isn't Mr. Keely a little "off" when he assigns to the brain the function of reproduction?

As an illustrative example of how his motor motes, he points out the analogous (?) action of gravity and centrifugal force. He says: "Our earth in its routine of revolution is governed by the same law (viz., the power of neutral attraction draws the molecules of any mass, no matter what the weight, toward the center of rotation, instead of toward its periphery, according to the intensity of the negative vibration that is induced upon that particular circle), in every particular, its mass tending toward its center of neutrality with a force that is equivalent to the character and velocity of its rotation. *If its rotation were increased, the tendency of everything associated with it would be increased towards its center of neutrality on the same ratio. That is, a pound in weight* would, under certain conditions of *increased velocity*, become *two pounds* in weight."

We quite agree with Mr. Keely that such would be the case were the "condition of increased velocity" the condition of *negatively* increased velocity.

"The laws governing the sympathetic rotation of vibratory machinery are the same laws that govern planetary suspension."

We are rather inclined to believe this too, for was it not by the observed wobbling of the other planets that the planet Uranus was discovered?

If Mr. Keely's mechanism will only wobble enough in its sympathetic outreach for fools' money, we firmly believe that it will increase its velocity negatively eventually, but certainly not until the dispenser of the wherewithal shall have forfeited all claim to the sympathetic spiro-vibrophonic aphonism of the material spirit.

Perhaps some of our readers fail to follow us here, but Keely, Mrs. Bloomfield Moore, and J. M. Stoddart will grasp the subtlety of our language, and they are the ones we are talking to, and we don't care very much if others don't catch on.

Most people will be with Keely when he says "To those who have not witnessed the operation of my devices, my theories must indeed seem wild." Not so with us, his arguments are more convincing than any demonstration of his apparatus could possibly be.

The article under review is divided into two parts. Those who have studied Latin will remember that "all Gaul was divided into three parts." In this respect Keely is inferior to Cæsar, but in this respect only. Cæsar was evidently talking of the Gaul which at that time occupied the western part of the European continent. Had he known of Keely's gaul he doubtless would have divided it into a million parts and then not known what to do with any one of them on account of its extreme size.

Part II is devoted to the subject "The Neutralization of Magnets." He introduces the subject by the question, "How can a magnet be robbed almost instantaneously of its magnetic power?"

Now most people would go about it in the antiquated way—not so Keely, for he tells how to do it much better in the answer which follows:

"The peculiarity of the sympathetic conditions which conserve a magnet to polar and antipolar currents of the earth [He is probably talking about Earth Magnetos here—ED.] prove perfect sympathetic equation between reception and distribution in that part of the electrical field which is classified in my system as inter-atomic vibratory oscillation.

"This oscillation represents, in its corpuscular field of action, an alternating wave motion of 128,400 vibratory exchanges per second, between polar reception and depolar distribution, thus establishing its perfect sympathetic concordance to that third of the electric triple stream which represents the sixths in vibratory sympathetic physics."

"We have now," he says, "reached a starting point from which to obtain a conception of the manner in which a magnet can be neutralized, that is, robbed of its coincident unity or subservience to polar negative attraction;" and then he states that "if a condition of antagonistic vibration is brought to bear upon it, its concordant sympathy to the polar sympathetic volume is broken up," and the magnet is robbed of its coincident unity or subservience to polar negative attraction, or, as we would say in vulgar language, is demagnetized.

He says he can do all this in fifteen seconds.

He concludes his article by announcing that he is preparing a series of experiments which will be conducted daily for one week before an expert committee for the purpose of enabling this committee to make a public announcement of the scientific and commercial value of his system of sympathetic vibratory physics. The series of experiments is as follows:

First—Operation of the polar circuit, drawing power from space, and showing control of various degrees of velocity.

Second—Sensitization of a polar disk, after having had its complete neutrality to magnetism tested.

Third—After associating it with the polar test-medium, heavily weighting it to demonstrate its attractive power: the weight remaining suspended to it by this power.

Fourth—Transmitter connected to the test-medium, while the disk is carrying weight. Negative vibration transferred: effecting complete dissociation, the disk and weights dropping to the floor.

Fifth—Rotation of compass needle, on a set of resonators, subservient to any one of the resonators, in defiance of its attraction to the north. Variations given: changing its subservience to different resonators, as the introductory impulse is changed.

Sixth—Mediums, representing the chords of different masses of metal made to float in a tall jar of water, with extraordinary changes of position.

Seventh—Operations of a sensitized globe, by sound.

Eighth—Operations of the globe under the influence of the improved polar sympathetic transmitter.

Ninth—Disintegration of water by triple vibration.

We hope that Mr. Keely will invite us to be present at these tests.

General News.

What is Going on in the Electrical World.

Hinsdale, N. H.—This town intends to put in an electric light plant at a cost of $10,000.

Pittsford, Vt.—An electric road from Pittsford to Rutland by way of Proctor is talked about.

Nortonville, Kan.—There is talk here of organizing a stock company to build an electric plant.

Bennington, Vt.—Work on the electric road between Bennington and Woodford has been begun.

Alvin, Tex.—The Business Men's Association are discussing the best means to establish an electric plant.

Oakland, Cal.—H. L. Peterman and Daniel Chisholm have applied for a franchise for an electric road in Eden township.

Tampa, Fla.—The Plant System intend putting up an electric elevator at Port Tampa for loading vessels with phosphate.

Murfreesboro, Tenn.—This city has been authorized by an act of the Legislature to issue bonds for an electric light plant.

Chattanooga, Tenn.—The time for submitting bids for the proposed municipal electric lighting plant has been extended to June 10.

Austin, Tex.—An election is to be held here on June 24 to decide whether or not the city shall issue additional light and water bonds.

Martins Ferry, W. Va.—Bonds amounting to $80,000 have been awarded, the proceeds to be applied to putting in an electric light plant.

Ironton, O.—The Ironton and St. Petersburg street railway has been sold at receiver's sale to D. Lamar of New York, who will change it to an electric line.

East Bridgewater, Mass.—The Brockton and East Bridgewater Railway Company has been granted a franchise for an electric railway in this town.

Woburn, Mass.—The receiver's sale of the Woburn Electric Light Company's plant, postponed from the 15th inst., is advertised to take place June 5.

Gadsden, Ala.—Prof. A. B. Jones, of Huntsville, will at once begin the erection of a musical conservatory here; an electric lighting plant of 200 lights capacity is to be put in.

Canfield, O.—At a special election held here a few days ago it was voted to issue $20,000 of bonds for the purpose of building an electric railway from Canfield to Lanterman's Falls.

Chester, Pa.—The city lighting contract for five years has been awarded to the Beacon Electric Light Company, whose bid was $16,250 less than that of the Chester Electric Light Company.

Lafayette, Ala.—Capt. R. J. Moore is receiving encouragement in his scheme to put an electric plant in this city. The council has agreed to take thirty lights for the streets.

Lansingburgh, N. Y.—Proposals will be received by the board of trustees until June 10 for lighting the streets of this village by electricity. Specifications will be furnished by George Gramm, the village clerk.

Quebec, Can.—The sub-committee of council appointed to consider offers made by Mr. Beemer for a franchise for an electric railway system in this city have reported in favor of granting the franchise under certain conditions.

Lansford, Pa.—The tracks and other property of the Inter-County Electric Railway, between Tamaqua and Lansford, have been ordered sold by the court because the company is insolvent and cannot pay certain claims against it.

Milwaukee, Wis.—Ninety per cent. of the bondholders of the Milwaukee Street Railway, it is reported, have assented to an agreement to place the property in the hands of a receiver preparatory to foreclosure and reorganization.

Newark, N. J.—The new trolley line to Jersey City, through Harrison and across the Hackensack Meadows, is almost ready for operation. It runs over the Lodi turnpike. The road crosses the tracks of the D. L. and W. Railroad.

Independence, Mo.—The Kansas City and Independence Rapid Transit Railway Company is considering plans for extending its electric road in Independence. The Air Line Electric Company is preparing plans for its railway in Independence.

Winchester, Mass.—The scheme for an electric street railway between Stoneham, Winchester and Arlington, which was agitated about a year ago, is being revived, and new men having taken hold of it it now looks as if the project will be pushed through.

Oshkosh, Wis.—The Oshkosh Street Railway Company have applied to the city council for the privilege of extending their line on Oregon street, and to change their motive power to electricity. They promise to give the city a first-class electric car line.

Charleston, S. C.—It is understood here that John B. Hoefgen and Edgar Moxham, representing a wealthy Brooklyn, N. Y., syndicate, have bought the two street railroads in operation here, and will consolidate them and use electricity as a motive power.

Los Angeles, Cal.—The trustees of the Los Angeles Consolidated Electric Railway have made a demand on the company for payment of the principal and accrued interest. Upon the failure of the company to meet the demand the trustees will sell the road to the highest bidder.

Detroit, Mich.—A contract has been signed with the Detroit Electric Light and Power Company by which the Detroit Railway (Everett line) secures the electricity heretofore used in lighting the city lights, and the cars will be run with it until the new power-house is completed.

Vicksburg, Miss.—The Vicksburg Electric Street Railway Co.'s franchise and other property, consisting of a mile of track, never operated, and 250 acres of land, have been sold to satisfy a New York mortgage and was bought in by C. F. Tag & Son and J. H. Benedict of New York for $17,000.

Allegheny, Pa.—The Department of Public Works has advertised for bids for electrical supplies, carbons, lamps, etc., the bids to be opened June 3. A list containing approximate quantities can be had and all information obtained by addressing Robert McAfee, director, at the department office.

Hoopeston, Ala.—The Hoopeston Electric Railway Company has been organized with a capital stock of $250,000. The company proposes to establish a system of electric railways to run in different directions from the town—to Gilman, to Sheldon, to Champaign, and Mineral Springs or Attica, Ind.

Wilmington, Del.—The directors of the Wilmington and Chester Electric Railway have held meetings lately to discuss plans of construction. The incorporators of the road are Garrett J. Hart, Peter J. Hughes, J. C. McComb, E. T. Cooper, A. J. Whittingham, Richard R. Kenney and J. Clayton Erb.

Flushing, N. Y.—The Steinway Railroad Company has taken formal possession of the Flushing and College Point Electric Railway, its purchase having been made in the interest of that company. The road itself is of little value, but the company had franchises in every important street in the village. The Steinway Company will shortly enter Flushing with a through line from Long Island City.

Dublin, Pa.—The talk of building a trolley line between Dublin and Souderton has been revived. It is said that a New York syndicate is interested in the project. Meetings in the interest of the trolley are being held in the villages through which the trolley would pass. The estimated cost of such a road is $128,000 for the eight miles between the points named, or $16,000 a mile.

Columbus, O.—The State Board of Agriculture has entered into a contract with the Fort Wayne Electric Corporation for an electric light plant for the State fair grounds. The capacity of the plant will be 200 arc light lamps, arranged on separate circuits and supplied from two separate dynamos. The plant will furnish light for night exhibitions in all the fair buildings and races on the speed track.

Leadville, Col.—Articles of incorporation of the Leadville Electric Power and Irrigation Company have been filed. The capital stock is $250,000. It is the intention of the company to use the water of the Arkansas River and to build a dam in Lake Park. The power-house will be located in Malta, four miles below Leadville. The incorporators are R. E. Goodell, of Leadville; J. H. Poole, of Denver, and E. W. Rollins of Boston.

Atlantic City, N. J.—Wm. H. Piersol, of this city, has been granted a patent for "an electric balloon elevator car." The balloon and car are combined and will run up and down a central iron tube, or frame work, to the height of 150 or 200 feet, the car revolving the while so that the passengers can obtain a wide range of view. The frame of the balloon will be covered with a yellow transparent material and the interior will be illuminated at night by electricity.

Napa, Cal.—L. Crothwell, of San Francisco, has asked for a franchise to run an electric road from this city north to Calistoga, a distance of 27 miles. He professes to represent a syndicate worth many millions, and offered to give a bond of $10,000 that the road will be built if the franchise is granted. He says he also purposes to build to Napa Soda Springs as well as to cover the town with complete lines. He estimates the cost of the proposed work at $400,000.

La Crosse, Wis.—The La Crosse, Black River Falls and Neillsville Electric Railway Company, lately incorporated, with a capital stock of $300,000, was formed for the purpose of constructing and operating an electric railway line for the carriage of passengers, mail, express and freight between La Crosse, Black River Falls and Neillsville, a distance of about eighty miles. The general offices of the company will be in La Crosse.

Milford, Mass.—It is likely that Milford will shortly be connected by a trolley railway with Hopkinton and therefore with Natick and Boston, as Boston capitalists have taken the matter in hand and proposed to help the business men of Milford who wish to have the road built. The Milford' men interested include C. W. Shippee, a local manufacturer, Treasurer R. B. Greene of the Milford Electric Light Company, and others who are very friendly to local storage battery interests.

New York.—Proposals for estimates for furnishing materials and work for completing an armory building and furnishing the same with gas and electric fixtures and kitchen ranges, on the easterly side of Madison avenue, extending from 94th to 95th street, in this city will be received by the Armory Board, at the Mayor's office, City Hall, until 12 o'clock M., Monday, June 10, 1895, at which time and place they will be publicly opened and read by said board. See *City Record* May 22 for full information.

St. Louis, Mo.—The city has filed suits against the Missouri Electric Light and Power Company, the Edison Illuminating Company and the Laclede Gas Light Company for non-payment of 2½ per cent. of their gross receipts for 1890 and 5 per cent. of their receipts for each year thereafter, as prescribed by the revised ordinances. The amounts claimed are $63,020.50 from the Missouri Company; $34,756.35 from the Edison, and $6,530.04 from the Laclede for its electric lighting department.—The county court of Jefferson county has granted a franchise to St. Louis parties to construct and operate an electric road from St. Louis to Morse's Mills.

Brooklyn, N. Y.—The Union Street Railroad Company have applied to the board of aldermen for a franchise to establish an electric railway line in this city. They offer to give the city 3 per cent of the gross receipts of the road and $30,000 in cash if the franchise is granted. The officers of the company are Reuben Leland, president; J. Greenough, vice-president; Edward M. Grout, secretary, and Edward Wilder, treasurer.—Sealed proposals will be received at the office of the Commissioner of City Works until June 4, at 12 M., for furnishing electric lights for streets and public buildings in the city of Brooklyn for the year 1895. Amount of deposit required, $1,500. Amount of surety required, $15,000.

Telephone and Telegraph.

A telephone exchange has been opened at Buford, Ga.

The Tiffin Telephone Company, of Tiffin, O., has been granted a 25-year franchise. Two hundred and fifty telephones have been subscribed for.

Superintendent A. R. Pflaum of the Hudson River Telephone Company reports he is meeting with success in introducing telephones in Port Jervis, N. Y., at the reduced rates.

The building of the long-distance telephone line between Columbus and Atlanta, Ga., is going on rapidly. Contracts have been let for the building of the line between Rome and Atlanta.

The directors of the Frankfort Telephone Company, of Frankfort, Ind., recently incorporated with a capital stock of $15,000, are Relief Jackson, Thomas Scantlin, W. B. Kramer, Jas. McClamrock, D. A. Coulter, J. C. Shanklin and James O. Hedgcock.

The Montauk, Orient and New York Telephone Company is considering whether it will increase its capital to $50,000 or submit to absorption by the New York and New Jersey Telephone Company. The latter company is extending its lines all over Long Island.

The West Shore Telephone Company is pushing its work up the Ulster and Delaware Railroad. Twenty-five new Seeley telephones have been put in at Kingston, N. Y., by the company. The Colvin instruments will be removed and the new Seeley 'phones placed in their stead as rapidly as possible.

The telephone line which has been constructed by Messrs. R. K. Van Etten & Sons, of Conashaugh, extending from Centréville, in the town of Sandyston, N.J., to Dingman's Ferry, Pa., and the Milford road to Port Jervis, has been completed and is now in successful operation.

At Lockport, N. Y., the Citizens' Mutual Telephone Company has decided to enter the field made by the Automatic Telephone Company of New York. On a three years contract, with 300 subscribers, this concern offers to put in a complete and satisfactory system at an annual rental of $30 for business houses and $20 for dwellings.

The Automatic Telephone Company, which has secured the privilege of erecting poles and wires in the streets of New Brighton and Edgewater, Staten Island, N. Y., has organized with the following officers: James Kerr, president; Dr. J. Walter Wood, treasurer; Andrew J. Hinton, secretary, and J. W. Allison, J. C. McGuire, George R. King, C. C. Pucci and Fred. W. Kerr, directors. The company proposes to furnish telephones for $30 per year, and already has over 200 subscribers.

COMMERCIAL PARAGRAPHS.

The Portable Fire Hose Bridge, for which the Metropolitan Electric Company, 186-188 Fifth avenue, Chicago, are general agents, is meeting with the approval of the electric railways. This company has already received orders from several roads and is constantly receiving inquiries.

The Bradbury-Stone Electric Storage Company have recently installed at the residence of Mr. W. E. C. Eustis, Milton, Mass., a storage battery of 1,000 ampere hour capacity, of their very latest type, in lead-lined wooden tanks. The plant is operated by wind-mill and is the second largest installation of this character in America.

The Metropolitan Electric Company, 186-188 Fifth avenue, Chicago, report a very good demand for their well known P. & B. products. Their numerous street railway customers express themselves as being well satisfied with results obtained from the use of P. & B. Tape and Compounds.

Test of Heine Boilers.

Tests were made some time since by Wm. H. Bryan, M. E., of twelve Heine Boilers, aggregating 4,500 H. P., installed in the Edison Illuminating Company's plant at St. Louis. When run at 26 per cent. above their rating an evaporation of 8.835 pounds of water per pound Illinois coal of 11,481 B. T. U. was secured, being equivalent to 70.13 per cent. efficiency. These boilers gave an evaporation of 7.258 pounds of water per hour per square foot of heating surface with but .84 of 1 per cent. entrainment.

These boilers had been sold on the guarantee of an evaporation of 8 pounds of water per pound of coal and 7 pounds of water per square foot H. S. with less than 1 per cent entrainment. The test established the fact that the guarantees were exceeded and the Heine Company received a bonus of $1,500, as had been agreed to be paid in the event of the guarantees being exceeded.

The company makes the broad claim that no other boiler in existence has shown, nor can show, a bona fide record of evaporation on similar low grade bituminous coal anywhere near the test shown above in evaporation per pound of coal and per square foot of heating surface.

BUSINESS HINTS.

Public Buildings, Theaters, Residences, &c., Proposed or in Course of Construction.

[The following summary is prepared weekly for ELECTRICITY for the information of advertisers and readers who are dealers in apparatus and articles required in the electrical equipment of public and private buildings.]

Albany, N. Y.—Building for an hospital. German Hospital Association. Directors: Gustave B. Schill, Simon W. Rosendale, Alfred H. Kestner and others.

Atlanta, Ga.—Five-story building to cost $55,000. John Ansley, Atlanta, owner.

Atlantic City, N. J.—A 150-room hotel. Bell & Scott, Atlantic City, owners.

Baltimore, Md.—Building for Southern Homeopathic Hospital, to cost $100,000. Directors; Eldridge C. Price, Elias C. Price, O. Janney and others.

Bangor, Me.—Hotel at Newcomb's Landing. Louis Greyer.

Bangor, Pa.—An opera house. W. R. Grubb, of Boonton, N. J., is interested.

Batavia, N. Y.—Hotel. John B. Arnold, proprietor.

Beaver, Pa.—Residence for Col. S. M. Moody. Architects Bartherger & East, Pittsburg, Pa.

Bennington, Vt.—Foundation of a savings bank completed.

Boston, Mass.—Apartment house, 50 suites. Rutland & Allen, Cambridge, owners. Architects Kendall & Stevens, Boston.

Bristol, Conn.—C. F. Michael has applied for permission to build an opera house here.

Brooklyn, N. Y.—The trustees of the Brooklyn Institute will erect permanent museum buildings, for which bonds will be issued by the city aggregating $300,000.—Manager Osborn of the Mansion House proposes to spend $50,000 in improvements.

Buffalo, N. Y.—Building for apartments and stores. Charles Roessler.—A similar building. George H. Lovell.

Cambridge, Pa.—Hotel. W. D. Rider, Jr., of Franklin, Pa., proprietor.

Charleston, W. Va.—Governor McCorkle will build a handsome residence in South Charleston.

Chase City, Va.—The Bank of Mecklenburg intends erecting an iron front building.

Cohoes, N. Y.—A theater will probably be erected on the site occupied by the National Bank.

Danville, Ill.—R. D. McDonald intends to erect a four-story pressed brick and stone building, to contain hotel and bank, to be lighted by electricity. Treat & Foltz, 58 Wabash avenue, Chicago, Ill., are the architects.

Flatbush, L. I., N. Y.—Building to contain flats and stores. George Moss owner.

Mt. Vernon, N. Y.—The people are to vote on the question of building a city hall and to expend $100,000 for the site and building.

Newark, N. J.—Apartment house, to contain 18 sets of apartments. Louis Mersfelder owner, Peter Charles architect.

Newport, R. I.—Business block on Broadway. H. P. Morgan owner.

New York City.—A six-story store and tenement building at 367 Broadway, by the American Express Co., Architect John B. Franklin, 56 Washington Square, South.—Four and five-story flats: At 220-228 43d st., Architect Chas. Rentz, 153 4th ave.; 112th st., south of 8d ave., Architects Neville & Baggs, 225 West 125th st.; 25-28 Amsterdam ave., Architect George F. Pelham, 1481 Broadway; 123d st., west of Lenox ave., Architect John Hauser; Forsyth st., Architects Snyder & Herter, 48 Bible House; 66th st., west of Central Park West, Architect Henry Anderson; 543 142d st., Architect John P. Walther; Union ave., southwest cor. Westchester ave., Architect James W. Cole, 403 West 51st st.; 109 East 73d st., Architect Max Muller; 114 8th ave., Architects A. R. Ogden & Son; 137th st., west of Madison ave., Architect J. Williams Lener; 289 East Fourth st., Architect C. D. Cohen; west side of Lenox ave., south of 114th st., Architect J. H. Valentine; 554 West 51st st., Architect David W. King, 198 Broadway; Lexington ave. and 121st st., Charles Richterman, Long Island City, owner; 151st st., east of the Grand Boulevard, Architects Webster & O'Brien; Union ave., southwest cor. of Westchester ave., Herman Schmuck, owner; 53d st., west of 8th ave., Wm. Rankin, owner.—The owners of the Merchants' Bank Building intend making it a twelve-story structure.—The property No. 80 Broadway has been purchased by the Standard Oil Co., who will use the ground for extensions to their present building and will also add six stories to the latter.—The Consolidated Stock and Petroleum Exchange are considering plans for adding twelve stories to their present building.—John T. Williams, 54 Franklin st., will erect a fifteen story and basement office building at 25-29 William st.—The Riverside Republican

Club will erect a club house, to be completed early in January.—It is understood that Gutwilling Bros. have purchased the property at 114 West 84th st. and will erect there a seven-story and office building, with the most modern equipments.

Paterson, N. J.—The Board of Freeholders have under consideration the question of remodeling the court house or erecting a new building.—Richard and Wm. De Gray will erect a business building at 67 Main st.

Perth Amboy, N J.—the authorities are talking of erecting a new city hall.

Philadelphia, Pa.—A club house is to be built for the Junger Maennerchor at 810 N. 6th st., Architects George F. Payne & Co.—Ex-Postmaster General Wannamaker contemplates building a hotel here for drunkards and other unfortunates.—Miles Day & Bro. are to erect a six story office building at 1521 Sansom st.

Providence, R. I.—A nine-story building is to be erected on Westminster st., on a site purchased from the Grosvenor Estate.

Pittsburg, Pa.—John C. McConnell will put up a colonial residence on Betrick st., East End, Architect J. E. Allison.

Plans have been prepared for a residence on 5th ave. for Charles Lockhart, Architect W. S. Frazier.—George K. Stephenson will erect a business block cor. Centre and Highland sts.

Richmond, Va.—The corner stone of the new Masonic Temple has been laid by Liberty Lodge F. and A. M.

Scranton, Pa.—A ten-story office building is to be erected on Spruce st., Architects Lacey & Son, Dime Bank Building.—J. C. Miller is about to erect a ten-story building to contain model club apartments for business men, a restaurant, etc.—The Traders' National Bank will put a $50,000 building on Spruce st., Architects T. R. Lacey & Son.

Toronto, Can.—The Independent Order of Foresters will soon lay the corner stone of their block.

Troy, N. Y.—The Troy Steel and Iron Works is to be re-established and extended. New and enlarged shops will be constructed on Breaker Island that will make the works the most extensive in this country.

Westerly, R. I.—Bids are asked for the construction of a new State House here. The material used will be marble. Contractors will be given until June 7 to hand in their proposals.

INCORPORATIONS.

The Northern Electric Company, Norwalk, Ohio—to manufacture and produce electricity for light, heat and power. Capital stock, $25,000. Promoters: Geo. P. Jones, Parks Foster, Mayne C. Foster, Burton P. Foster, John W. Foster.

The Keystone Amusement Reporting Company (incorporated in W. Va.), New York, N. Y.—to manufacture, vend and rent electrical and mechanical devices for electrically or mechanically reporting baseball and other sporting events, etc. Capital stock, $100,000. Promoters: Melvin D. Compton, Abram Wyckoff, Newark, N. J.; Geo. L. Thomas, Baltimore, Md.

The Chicago, Lamont and Joliet Electric Road, Chicago, Ill. Capital stock, $300,000. Incorporators; E. H. Heilbronn, S. T. Hart, E. D. Hopkins, G. Lawrence Taylor and D. C. Baldwin.

The Syracuse and Oneida Lake Electric Railway Company—to operate an electric street road twelve miles in length, the termini to be in the towns of Cicero and Salina, Onondaga County, N. Y. Capital stock, $300,000. Directors: Hiram McGonegal, of New York; W. S. Wales, W. B. Kirk, J. B. Morgan, William O'Connor, Thomas Meacham, Edwin Ledder, James N. McCormick and William E. Wheaton, of Syracuse.

The Orange County Telephone Company—to operate in Middletown and other sections of Orange County, N. Y. Capital stock, $10.000. Directors: Lewis S. Stivers, John E. Iseman, Albert B. Wilber, Frank M. Stratton, and others of Middletown.

The Hanover Telephone Company of Silver Creek, Chautauqua County—to operate telephone lines connecting villages in the town of Hanover, N. Y. Capital stock, $1,000. Directors: R. J. Quale, R. M. Evarts, E. Thomas, and others of Silver Creek.

The Sullivan County Telephone Company, Jeffersonville, N. Y. Capital stock, $5,000. Directors: Charles Homer, William H. Lawrence, and Edward Homer, of Jeffersonville.

The Blue Earth Telephone Exchange Company, Winnebago City, Minn. Capital stock, $50.000. Incorporators: W. B. Haight, Andrew C. Dunn, C. F. Howe, L. A. Smith, C. H. Patten, David Secor, W. D. Smith, W. H. Hill and W. A. Hinton, all of Nashville, Martin County, Minn.

The Utica Gas Fixture Company, Utica, N. Y.—to manufacture gas, electric and combination fixtures and electrical supplies. Capital stock, $20,000. Incorporators: Alfred Sieboth, Wilson C. Williams and Clarence B. Crouse.

The Newtown Light and Power Company of Newtown, Queens County, N. Y.—to manufacture electricity for power, light and heat. Capital stock, $20,000. Directors: J. C. Smith, of Babylon, N. Y.; George B. Gallagher, of Brooklyn; Francis McKenna and George S. Jervis, of Maspeth, L. I.

The Sanburn Electric Railway Company, Chicago—to construct and operate railways from Chicago to cities towns and villages in counties of Cook, Lake, Dupage and Kane to Aurora. Capital stock, $250,000. Incorporators and first board of directors: George O. Talbot, of DeKalb; James W. Kenney, Oscar L. McMurray, Homer K. Galpin, and J. S. McGlashem, Chicago.

The South Omaha Water Works Company, Omaha, Neb.—to establish an electric light and water plant. Capital stock, $1.000,000. Incorporators: W. A. Paxton, John A. Creighton and Louis Schroeder.

The Howard Construction Company, St. Louis—to construct the proposed line of electric road from the western part of St. Louis through Kirkwood to Meramac Highlands. Capital stock, $10,000. Incorporators: Thomas Howard, John A. Holmes, J. C. Richardson, Estill McHenry, John J. Broderick, N. C. Chapman, Charles B. Greeley, L. R. Blackmer, Thomas M. Gallagher, J. B. Case M. C. Orton, J. H. A. Meyer and J. P. Dawson.

The Guayaquil General Electric Company (incorporated in W. Va), New York, N. Y.—to prosecute electric lighting and all other business in which electricity is used, including manufacturing, generating and selling the same. Capital stock, $50,000. Promoters: Manuel de J. Alvarado, Brooklyn, N. Y.; Vincente Harvie Emes, Frank E. Rogers, New York City.

The Bell Electric Company, Trenton, N. J., and New York, N. Y.—to manufacture and sell electric singe cutting combs and other electric apparatus and appliances. Capital stock, $100,000. Promoters: Frank M. Bell, New York, N.Y.; Geo. A. Westbrook, Wm. Childs, Jr., Brooklyn, N. Y.; Abram V. Robinson, Trenton, N. J.

The Electric Amusement Reporting Company (incorporated in W. Va.), New York, N. Y.—to manufacture, vend and lease electrical and mechanical devices for electrically and mechanically reporting baseball and other sporting events. Capital stock, $100,000. Promoters: Melvin D. Compton, Abram Wyckoff, Albert Manning, Newark, N. J.

The Leadville Electric Power and Irrigation Company, Denver, Col.—to erect and operate electric light plants for light, heat and power, etc. Capital stock, $500,000. Promoters; John H. Poole, Roswell E. Hodell, Edward W. Rollins, Denver.

The Plymouth Water, Light and Power Company, Plymouth, Wis.—to erect water, light and power works, etc. Capital stock, $50,000. Promoters: H. E. Dow, A. W. Schram, H. Wheeler, Jr., Plymouth.

The Humboldt Manufacturing Company, Arcata, Cal.—to manufacture electricity, etc. Capital stock, $15,000. Promoters: C. A. Callstorm, J. Cullberg, Jr., Wm. Chaffey, J. M. Moore, Arcata.

The Suburban Electric Railroad Company, Chicago Ill.—to operate a railroad. Capital stock, $1.250,000. Promoters: Geo. D. Talbot, Jas W. Kenney, Oscar L. McMurray, Homer K. Galpin, J. S. McGlashan.

The Decker Automatic Telephone Exchange, Jersey City, N. J.—to own, lease, construct and maintain electric telephones, automatic and other switchboards. Capital stock, $100,000. Promoters: Ward Decker, Edmund A. Hinckley, John P. Bell, Owego, N. Y.; Dewitt Clinton Jones, Elizabeth, N. J.

The Sea Beach Construction Company, Jersey City, N.J.—to construct and equip electric street railways. Capital stock, $100,000. Promoters: John E. Bowles, New York, N. Y.; T. Bridgewater Jones, Staten Island, N. Y.; J. Herbert Potts, Jersey City, N. J.

The Rexford-Whitmore-Eldred Improvement Company, Seattle, Wash.—to build and operate electric plants, etc. Capital stock, $6,000. Promoters: Louis A. Rexford, Jesse K. Whitmore, Elton Eldred.

The Geauga County Telephone and Electric Company, Huntsburg Center, Ohio—to establish, conduct and operate a line of electric telephone from the center of Huntsburg Township to Chardon, all in Geauga County, Ohio. Capital stock, $2,000. Promoters: Geo. W. Pease, L. T. Wilmot, O. M. Barnes, J. C. Mastick, S. A. Rowley, M. J. Andrews.

The Monrovia Electrical Power Company, Los Angeles, Cal.—to sell and lease power, heat and light created by use of electricity and furnish power to pump water for irrigation, etc. Capital stock, $100,000. Promoters: W. N. Monroe, C. Dorland, J. H. Bartel, Monrovia, Cal.; H. V. Carter, J. F. Sartori, Los Angeles, Cal.

The Edison Phonograph Company, of San Francisco, Cal.—to buy, sell, lease and deal in phonographs, kinetoscopes, graphophones, etc.; deal in electric batteries and electrical apparatus of every character. Capital stock, $100,000. Promoters: Seymour B. Korn, Thos. J. Craig, I. Wertheimer, S. L. Ackerman, San Francisco.

The Lancaster Water, Light and Ice Company, Lancaster, Tex.—to supply water and electric light to the public, and manufacture and sell ice. Capital stock $15,000. Promoters: R. P. Henry, S. L. Randlett, W. A. Starlin, F. M. Hammond, W. L. White, Lancaster, Tex.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MAY 21, 1895

ELECTRIC RAILROADS AND APPLIANCES.

589,418. Conduit System for Electric Railways. Wilson H. Cotton, St. Louis, Mo. Filed Aug. 25, 1894.

589,516. Trolley for Electric Railways. John W. Hoag, Newark, N. J. Filed Jan. 19, 1895.

589,616. Electrical Bond-Clamp. Alfred Green, Rochester, N. Y. Filed Aug. 27, 1894.

589,681. Base for Trolley-Poles. Alfred Green, Rochester, N. Y. Filed Sept. 5, 1894.

589,726. System of Controllers for Electric-Motor Cars. Charles L. Coombs, Washington, D. C., assignor to Theodore D. Dale, Marietta, Ohio. Filed Nov. 12, 1894.

ELECTRIC LIGHTS AND APPLIANCES.

589 537. Cleaner for Incandescent-Lamp Bulbs. William O. Niles, Boston, Mass., assignor to Frank A. Chapman, New York, N. Y. Filed April 13, 1894.

589,622. Cut-Out for Arc Lamps. Peter Kirkegaard, Brooklyn, N. Y. Filed Nov. 9, 1894.

DYNAMO ELECTRIC MACHINERY.

589,404. Regulating Alternating Current Induction-Motors. Albert H. Armstrong, Schenectady, N. Y., assignor, by mesne assignments, to the General Electric Company, same place. Filed Dec. 5, 1894.

589,778. Rheostat-Switch for Electric Motors. Frank B. Rae, Detroit, Mich. Filed July 6, 1894.

TELEPHONE AND TELEGRAPH APPARATUS.

589,437. Microphone. Ernest J. P. Mercadier and Joseph M. Anizan, Paris, France. Filed June 3, 1893.

589,512. Telegraph-Relay. Alois Gruner, San Francisco, Cal. Filed July 28, 1894.

589,636. Transmitter-Diaphragm. George A. Nellis and Florence S. Welsser, Allegheny, Pa. Filed March 11, 1895.

589,712. Telephone-Call. Frederick J. Troll, Washington, D. C. Filed Sept. 22, 1894.

SIGNALS AND SIGNALING APPARATUS.

589,431. Electric Bell. Francis G. Ingersoll, New York, N. Y., assignor to the Dewey Electric Signal Company, same place. Filed Oct. 26, 1894.

589,529. Electric Railway-Signal. Henry V. Miller, Bloomington, and Alexander C. Miller, Aurora, assignors to the Miller Incandescent Railway Signal Company, Chicago, Ill. Filed Jan. 5, 1895.

589,701. Multiple Signal-Transmitter. Bernice J. Noyes, Boston, Mass., assignor to George W. Gregory, same place. Filed Nov. 4, 1890.

MISCELLANEOUS.

589,446. System of Electrical Distribution. Edwin W. Rice, Jr., Swampscott, assignor to the General Electric Company, Boston, Mass. Filed May 24, 1893.

589,450. System of Electrical Distribution. Charles P. Steinmetz, Schenectady, N. Y., assignor, by mesne assignments, to the General Electric Company, same place. Filed Dec. 20, 1894.

589,452. Electric Meter. Charles P. Steinmetz, Schenectady, N. Y. assignor to the General Electric Company of New York. Filed Feb. 19. 1895.

589,453. Carbon Brush. Elihu Thomson, Swampscott, Mass., assignor, by mesne assignments, to the General Electric Company, Schenectady, N. Y. Filed Feb. 6, 1895.

589,454. Carbon Brush. Elihu Thomson, Swampscott, Mass., assignor, by mesne assignments, to the General Electric Company, Schenectady, N. Y. Filed Feb. 6, 1895.

589,500. Automatic Time-Switch for Storage-Batteries. William Biddle, Brooklyn, N. Y. Filed May 18, 1894.

589 501. Electrical Instrument for Medical Purposes. Benjamin Y. Boyd, Wichita, Kans. Filed Aug. 27, 1894.

589,511. Signal-Box Attachment. Alois Gruner, San Francisco, Cal. Filed July 28, 1894.

589 542. Magnetic Car-Balancing Device. William B. Purvis, Philadelphia, Pa., assignor of one-half to John Alexander Craig, same place. Filed May 26, 1894.

589,559. Electrical Low-Water Indicator for Boilers. Chas. D. Tisdale, Boston, Mass., assignor, by direct and mesne assignments, of three-fourths to John D. Gould, Brooklyn, N. Y., and Charles A. Hanson, Orange, N. J. Filed April 19, 1894.

589,576. Electric Safety System for Railway-Drawbridges. Edward Deming, Brooklyn, N. Y. Filed April 4, 1894.

589,583. Electric Cut-Out. John R. Hersh, Denver, Col., assignor to Louis E. Kenworthy, same place. Filed Jan. 11, 1895.

ELECTRICITY.

Vol. VIII. NEW YORK, JUNE 5, 1895. No. 21

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER CO.
B. E. GREENE, PRES'T. L. J. MONTGOMERY, SEC'Y.

PUBLICATION OFFICE:
6 Park Place - New York

EDITORS: NELSON W. PERRY.
BURTON E. GREENE.
R. H. WILLOUGHBY.

BUSINESS MANAGER, - - JOHN L. GANS.

SUBSCRIPTION RATES:
UNITED STATES, - - - - - $2.50
IN CLUBS OF FIVE OR MORE, - - - - - $2.00
FOREIGN COUNTRIES, - - - - - - $4.50
SINGLE COPIES, - - - - - - - 10 CENTS

ADVERTISING RATES:
As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.
Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

ENTERED AT THE N. Y. POST OFFICE AS MAIL MATTER OF THE SECOND-CLASS.

TRADE SUPPLIED BY
THE AMERICAN NEWS COMPANY,
THE WESTERN NEWS COMPANY,
And their Agencies in all Principal Cities.

EDITORIAL NOTES.

Where the Responsibility Lies. ELECTRICITY offers no apology for dwelling at length, and repeatedly, upon the worse than unsatisfactory condition of affairs in the electrical trade. ELECTRICITY has not created this condition, and it is only upon the theory that deception is better than truth that trade papers are expected either to publish direct falsehoods or to withhold the facts in regard to the situation.

The trade is in worse condition to-day than any other trade in the country, except possibly the cordage trade. Not one concern in twenty is making even a moderate interest upon the capital invested. While the salaried men in the direct management may boast of a big business, increasing in volume, the capitalists, who care less for volume of business than for profits, are disheartened and discouraged. It is almost impossible to obtain fresh capital in any line, no matter what the apparent showing may be. Failures in three years have been many and disastrous. They are nothing as compared with the failures which must come in the next three years unless radical reforms are inaugurated. Those who furnish the raw material, however, have learned a few lessons, and they are justly becoming chary of extending credits to concerns who sell a manufactured product at cost or less.

And it is essential that the present condition of affairs in the trade be properly appreciated. We passed through the period of depression as did all other industries. But when the time for general recuperation came *this trade was not in it*. Throughout the length and breadth of the land we hear the news of a general revival. The sure sign of increased profits to capital comes in the almost universal increase in wages. The current of prosperity is moving again. But what of the electrical trade?

With the present ideas of business which control some of the larger corporations, the general revival of business means to us only an increase in volume with a corresponding increase in losses. Prices have been established by men who have little interest in solid commercial success, by men whose only apparent ambition is to juggle with stocks and make money in an illegitimate way while the honest investor is robbed of any chance of a return on his investment.

The general business depression was not the cause which brought this business to its present disastrous state. The cause dates back to the very beginning of the industry. Such is the strength of this trade that if conducted upon proper lines we should scarcely have been aware of the depression in other lines. The very fact that it could at all survive the methods by which it has been conducted is proof positive of its marvellous inherent strength.

Instead, therefore, of concealing the truth, it is the duty of the press to point out the actual causes for the wreck of a magnificent industry, thereby to make possible the eradication of the disease which has already proved well nigh fatal. And ELECTRICITY always does its duty.

There are still left in this trade a large number of men who have entered into it for their life work. They may be disheartened, but they have not given up. It is for them that we write. To them we present our argument, and to them we must all look for the re-establishment of business principles, the reinforcement of the doctrines of common sense.

It is for these men to consider just why the wrong has temporarily triumphed over right, why it was possible for the tricksters and adventurers to bring the industry to its present condition.

And when these questions receive careful thought the only answer possible is that the electrical press has not done its duty.

If the *Electrical Engineer*, the *Electrical World*, the *Electrical Review* and the *Wester Electrician* had faithfully done their duty by the trade they claim to represent, whose best interests they claim to guard, the present situation would never have confronted us; the electrical business would have been established upon a solid basis, and would not have become a veritable graveyard for invested capital.

Whatever blame, therefore, attaches to the stockjobbing speculators who have ruined the business, upon the press lies the responsibility for allowing them to succeed. They could not have succeeded if the press had done its duty.

And it must not be supposed that this duty of telling the truth first confronted these papers in 1892 upon the formation of the G. E. Company. ELECTRICITY'S campaign against this organization was not based upon any supposition that its unjust policy and corrupt methods were new to the trade. The attack was made because this company was the climacteric, the embodiment of all the evil principles which had begun to be practised in 1880 and had gained strength year by year, driving the honest and conservative element nearer and nearer to the wall.

It was not therefore in 1892 alone that these papers should have risen to the occasion and showed their devotion to the better element. That duty had confronted them for twelve years, and not for one single issue did they ever have the courage to perform it.

It is idle for them to claim ignorance. They could not have been ignorant, at least not all of them. Possibly the publisher of the *Electrical World*, who alone is responsible for the policy of that paper, never had the mental capacity to appreciate the situation; not so with Mr. T. C. Martin or Mr. Charles W. Price. They mingled with the people and had the knowledge of affairs *forced* upon them. And if ever a paper has thrown away forever opportunities of success that paper is the *Electrical Engineer*. It has shown the white feather, to its eternal disgrace. To properly appreciate the guilt of these papers, it is only necessary to briefly review the past.

The *Electrical Engineer*, the *Electrical World* and the *Electrical Review* are the oldest papers in the field. They date back almost to the beginning of the commercial applications of the art. Their editors were familiar with the history of the business and had mingled with the leaders, both technically and commercially, from whom they could not have failed to learn the end towards which the whole industry was being driven. They had associated with the central station men and knew the injustice and humbuggery of which they had been the victims.

They had full opportunity to know that most of the men whose work had really created the industry were unalterably opposed to the prevailing methods of those capitalists and business men who came into it early, but without a single creditable motive, and who have finally succeeded in giving to the whole business the reputation of being little else than a stock-jobbing swindle.

These papers could not have existed at all, they never could have been started, except for the industry and conscientious devotion of a few scientific workers who labored early and late with the full conviction that a vast and profitable industry, based upon a sound and lasting foundation, could be built up. In fact they were not called into existence until these labors and their results had become of sufficient public interest to warrant the establishment of mediums for the distribution of information to the general public as to what the inventors had accomplished, and especially to those who by various methods had been induced to invest their capital in the business of electric lighting and transmission of power. It was to the desire of this class to know what was going on and to the smaller allied manufacturing interests who desired to lay a description of their products before the infant trade, that these papers owed their first commercial returns; and it was to the honest technical workers who made the thing possible they were first of all under obligations.

It is plain, therefore, that these papers had a duty to perform almost from their first issue. That duty was to protect the legitimate trade from the encroachment of the speculators, to nurse it and care for it, to ensure it a sound and healthy body. It was clearly their duty to see to it that those methods which have disgraced it and smirched it should never have obtained any foothold.

It is no palliation to claim that they did not foresee the results, and that they hoped for the gradual purification of the trade through the working out of natural laws. Any man with brains enough to run a newspaper could not help foreseeing just what must be the ultimate result of the policy pursued. If the press has any mission, it is to see with clearer eyes than the multitude, and to tell the truth at whatever temporary sacrifice. And if these papers had done this from 1880 up to the present time, there would, no doubt, be less money invested than there is; there would have been much less apparatus put out. On the other hand, ten times as large a percentage of central stations and railroads would have been profit earners; and if there had been fewer people engaged in the business, those who were in it would have accumulated handsome competencies, there would have been good profit to-day in every branch, and the users of apparatus would have got better value for their money.

When these papers saw Edison Electric Light stock sold at $5,000 a share upon the ridiculous claims, inaugurated by Mr. Edison himself, that the electric light would drive gas out of the market, that a 16 C. P. lamp could be maintained in commercial use at 16 cents a year—when they saw the money of investors flowing into the pockets of the unprincipled speculators upon these claims, then it was time for them to speak. When they saw the continued misrepresentations to local capitalists, in the endeavor to draw from central stations large sums of money for worthless rights made by the United States Company and others, then it was time for them to speak. When they saw the Thomson-Houston Company enter the field, and build upon the electrical manufacturing business the wickedest and most far-reaching financial swindle of the decade, then it was time to speak. When they saw all the evil and corrupt methods which had disgraced the entire history of the art culminate in the formation of a gigantic stockjobbing corporation in 1892, then again it was time to speak.

And not on one single occasion have these papers or any one of them performed their duty.

If they had told the facts to the public, made clear the actual situation, the possibilities of the art and its limitations, from 1880 to 1890, a large part of the disgrace and dishonor would have been averted, and universal bankruptcy would not now be hanging over us like a threatening cloud. If they had shown the stockholders in the large corporations how grossly their interests were being mismanaged, the irresponsible speculators who forced themselves into the management would have been displaced by those whose chief ambition would have been to establish a solid manufacturing business and to return profits to investors.

These people and their methods have got to be forced out now before prosperity will come to this trade. They should never have been allowed to gain a foothold.

When the rank and file, therefore, look for the causes of present conditions they are not hard to find. And upon the electrical press must forever rest the responsibility for ignoring the interests of those who made its existence possible, and pandering to the worst elements—upon the press rests the responsibility for allowing the fundamental causes to continue in operation, unchecked and unexposed, until the electrical trade is almost irretrievably disgraced and discredited, and electrical securities are a laughing-stock in the money markets of the country.

* * *

The Telephone Situation. In this issue we give what is undoubtedly the most comprehensive and reliable statement of the telephone situation as it appears to-day that has yet been published, and one which will astonish those who have not gone into the subject closely. It is rare, indeed, that a monopoly that has existed unimpaired for so long a time as the telephone monopoly seemed so nearly overthrown on the instant as the Bell monopoly.

In regard to this monopoly we wish to make our own position clear. The American Bell Co., by reason of fundamental patents which have stood the tests of unremitting attack from all sides, was granted a monopoly of the business for seventeen years. This they were entitled to so long as they conformed to the laws enacted for the regulation of such a monopoly as is granted by the United States patents. They have conformed to these laws, prosecuted promptly every infringer, and during the period deserved the protection which the law promised. These patents gave to the world a new and most useful art, and in return the United States has given to them a reward which its laws vouchsafe to great and useful inventions. We have not one word to say against this, for it is as it should be.

But the Bell Co. has received *more* than is vouchsafed by the patent laws. By the very nature of its business it required more, and the greatest usefulness of the invention of telephony was enhanced by this increment—this unearned increment it may be called. We refer to the hundreds of municipal and other franchises which were granted to this company and its agents, and by which it hopes to perpetuate its monopoly. Does not the Bell Company owe the public something for these? It apparently thinks not, and its policy since the expiration of its basic patents has been to use these free gifts of the public as weapons against that public which gave them. There is an old saying to the effect that the voice of the people is the voice of God. The people granted the Bell Company a monopoly for a great and useful invention, and paid them liberally for it. They granted them more—franchises by which that monopoly might be continued. This was a bonus. The public temper now is to patronize anyone in preference to the Bell people, even though there were improvement neither in the service nor in the rates. Many of the independent telephone companies now give better service and better rates, and the Bell Company, strongly intrenched as it is behind its already enormous system and valuable franchises, has been made to tremble.

We have said that we had no criticism to offer to the Bell Company's stewardship of the monopoly granted it by the United States patents, and implied that it was in some respects a model steward. This is true in regard to the fundamental Bell telephone (receiver) patent, but unfortunately there is a blot on its record whose stench rises to heaven and calls for heroic measures if our very patent system is not to be wiped out per consequence. We refer here to the disgraceful and disreputable jugglery connected with the Berliner patents by which the Bell Company hoped to perpetuate for another fourteen years of undeserved monopoly that which they had rightfully enjoyed for the full term of seventeen years.

Judge Carpenter's decision seemed to put to rest the grave fears which were aroused for our patent system by the Bell Company's dishonesty, and his characterization of their action was none too severe, but the deadly microbe has been set free again by the reversal of this honest judgment by the United States Circuit Court of Appeals of Massachusetts.

As pointed out in a recent editorial in these columns, there has in the past been such a considerable hue and cry against our patent system—due, as we are convinced, largely to the miscarriage of the laws—as to seriously threaten the system as a whole. It is known to those who are posted that this feeling is strongest in the West. Among the masses of those residing west of Pennsylvania and south of Mason and Dixon's line, there is an ill-concealed opposition to the patent monopoly to which this country owes so much of its prosperity, and it only requires a few such mal-administrations of the laws as have recently occurred to fan this feeling into a state of combustion that will entirely consume and destroy this magnificent pillar of American civilization. This clamor for the repeal or change of the patent laws if once thoroughly aroused will drown all opposition, and by the very force of its volume sweep all before it.

Since the decision of the United States Circuit Court of Appeals rehabilitating the Berliner patents has been made public we have heard the rumblings from the West. We receive newspaper clippings from the daily press from all sections of the country, and those from the West are so unanimously condemnatory of the situation as to forebode no good to the faulty yet all in all the finest patent system in the civilized world. Our Western contemporaries mistake the cause for the effect. They are justly indignant at the Bell Company, but unjustly attribute their dishonesty to faulty patent laws, whereas the fault lies not in the laws themselves but in their administration and a disgraceful acceptance of so-called expert testimony which is often nothing more than legalized perjury.

The Bell Company is firmly established and deservedly so. What we have endeavored to show in our article this week, both for the public benefit and the best interests of the Bell people themselves, is that the latter are no longer supreme. Honest competition has arisen. It is growing. It is here to stay. And to the independent companies, who conduct their businesses on sound lines and with due regard for the rights of others, and who not only forward their own interests but those of the public by forcing improved service and lower rates, ELECTRICITY extends the right hand of fellowship.

* * *

The Underrunning Trolley Litigation. In our last issue we printed eight columns of matter, including illustrations, in regard to one of the most important lawsuits in electrical history, viz., the suit of the T.-H. Company against the Winchester Avenue Electric Railroad Company of New Haven, Conn., and the Westinghouse Electric and Manufacturing Company of Pittsburg, Pa. The importance of this suit will be realized when it is understood that it was an effort on the part of the G. E. Company to establish in itself the sole ownership or monopoly of the underrunning trolley as now universally manufactured and used in this country. We considered it no great piece of enterprise to send a representative up to New Haven to attend and report the case, and are not therefore taking to ourselves any very great credit on that score. But what was our surprise upon finding that not one of our contemporaries was there to do likewise. We were not surprised so much at the absence of the *Electrical World* during the arguments, for that journal has so long ceased to be either a newspaper or a reliable chronicler even of stale facts, that no one expects much of it any more, but we were surprised that the *Electric Age*, the *Electrical Engineer* and the *Electrical Review* had allowed the opportunity to slip by.

It will be noticed that three of the contemporaries mentioned are quarreling among themselves as to their relative ages—each claiming to be the only original great *oldest* electrical periodical extant. But with age usually comes drowsiness, and if age can be safely gauged by this test, they all seem to be about on a par, with a neck in favor of the *World*. The latter has, in fact, with great foresight and wisdom, established a graveyard called the Digest, where much literature of value finds sepulture from profane eyes. If another paper gets an item ahead of the *World*, the latter comes out the following week with a "digest" of that same article, and nobody of course sees it. It goes into the index, however, and the editors are saved the humiliation of publishing, where chance readers may see it, important news that is second-handed.

One of the most important papers that have been read during the past several years was the recent one of Prof. Ewing's on his new device for testing the hysteresis of iron. We published this paper a week ahead of all of our contemporaries, and the *World* a week later gave it mention in the Digest.

We expect this week to see mention of our report of the underrunning trolley litigation in the Digest, if the latter is what it claims to be and its editor is fair. But won't it be rather galling to the *Electrical World* to credit us with important news that it missed? It will be a great strain on the editor's fairness and—will he be fair? We'll see.

Under the Searchlight.

Views and Opinions on Timely Topics.

We Can.

(From the New Haven Courier.)

ELECTRICITY can now move railroad trains.

Not only this, we can move the world. We are moving it.

* * *

THE Rome (Ga.) Gas Company recently levied upon the property of the Rome Electric Light Company for $1,800 due for rent. Of the $175,000 securities of this company, $20,000 are held by the G. E. Company, $30,000 by the United Electric Securities Company, and $36,500 by the Street Railway and Illuminating Properties. Rome has a population of 6,000.

* * *

ALWAYS ROOM FOR MORE.

ELECTRICITY welcomes to the field of electrical journalism Prof. J. P. Barrett's new venture, the *Electrical Journal*, the official announcement of which is as follows:

[COPY.]

CHICAGO, May 24, 1894.

Gentlemen: We are about to begin the publication of the *Electrical Journal*, "a newspaper devoted to the interests of Electrical Progress and Education." The publication will be issued every two weeks at the beginning, the first number will be an edition of 3,000, 32 pages and cover, the size of printed page 10⅜x7 inches, and will be as well gotten up mechanically and scientifically as it is possible to make it. The *Journal* is intended to appeal not only to commercial electrical interests but it will begin the first number with a clientele made up of 2,500 members of the National School of Electricity. The members of the school are mechanics, central station employees, telegraph and telephone men. Each one of our seventy-one classes contains at least one or two managers of central stations in the localities in which they are situated. The classes also include doctors, lawyers and business men.

We shall push this publication as rapidly as possible in the channels occupied by the other electrical journals, but shall also invade a new and unique field in this class of journalism. We should like very much to use some of your advertising matter in the first number and would request you to send at once the matter and cuts, if you care to use them, for an advertisement about the size that you usually occupy in the other electrical journals. There will, of course, be no charge for this number. If the matter in the advertisement used in the other papers is satisfactory to you, we would be glad to set it up from one of these, but we would like to use a cut or two, if you are accustomed to use such for advertising purposes. We should like very much also to have you give us some notes, either business or personal, for our news columns, and we should be glad to print some descriptive matter of any new instrument you are furnishing for the market.

Our clientele at the beginning of our publication will be made up of people interested in the kind of goods you make and sell, and we are quite sure that your wares will be given prominence through the channel of our journal.

Thanking you in advance for the courtesy of your acquiescence in our request, we are, very respectfully,

THE ELECTRICAL JOURNAL PUBLISHING CO.,
J. P. BARRETT, President.

It was of course to be expected that the Professor, with his fine commercial instincts, would think first of the advertising department of his paper. This we find he has done from the above notice.

We have already reviewed one of Prof. Barrett's editorial efforts, his World's Fair book, and we fear from the above that his paper is to be edited in the same way—that is, that advertisers will send in what they want printed, the editorial labor thus being made easy.

The *Journal* is fairly certain to start off with a good patronage. Every manufacturer who expects to sell anything to the city of Chicago will give it respectful consideration. We have no doubt that Prof. Barrett will be able to make a harder fight against Uncle William Kreidler than ELECTRICITY did in its early life in Chicago. If the Professor spends a few of the $250,000 which he is said to have accumulated on his modest salary, and makes a bright and healthy paper, the world will be the better for it.

If there were anything in his past history to denote that it would have any effect on him, we might make a few remarks upon the propriety of Prof. J. P. Barrett, holding the official position he does, engaging in the newspaper business. But we have no space to waste.

* * *

G. E. SHARES have advanced of late on renewed reports of a Westinghouse-G. E. deal. This fact shows the short-sighted wisdom of Wall Street operators. If such a deal is ever made, both organizations will go into bankruptcy with the rapidity of a comet shooting to earth. The day for successful "deals" and "trades" in this business has passed forever.

* * *

TELEPHONES FOR THE MILLION.

The Svengali Buncophone Company Organized.

Mr. P. R. O. Moter sat at his desk in his office on the 'steenth floor of Schemers' Block. He was aroused from his meditations when the door opened quietly and a man with Svengali beard and hair and Uriah Heap tread entered and tiptoed across the floor. Under his well-worn coat he carried an oblong walnut box partially concealed by an old newspaper.

"Are we alone?" the visitor whispered in phonographic tones as he sat the box on the desk.

"Yes, what do you want?"

"I don't want anything, but I'll show you what I've got, then you'll be asking me what I will take."

As he began to unwrap his package he said:

"I have here what the inventive genius of the world has long sought to create but failed; what capitalists will make millions out of and through the use of which thousands of business men will be relieved from the exactions of a huge monopoly. In short, I have the only non-infringing telephone ever made. I use the ordinary Bell receiver, but my 'phone requires no transmitter, no magneto, no induction coil, no battery, no switch, no central exchange, no hello girl. This 'phone is not affected by static capacity of conductors, by induction, or by crosses with trolley lines, or by short circuits or grounds. You just connect this binding post to the line and this one to the earth. Put the receiver to your ear, turn your back to the box and there you are—ready to talk to your next door neighbor or the Emperor of China."

"What will you take for your patents?" Mr. Moter asked.

The visitor rested his elbows on the desk before him, buried his head in his hands and his mind in about six feet of thought before replying. At last, straightening himself to his full height, he said:

"If all of the unavailable assets of the G. E. Company were turned into good hard cash, I would not trade my patents even up. But I'll tell you what I'll do. If you will give me $10,000 in cash and a royalty of ten cents on each instrument made, I'll give you the exclusive right to make the 'phone under my patents."

"Come now, let's talk business," Mr. P. R. O. M. suavely said. "I'll give you $10 in cash and $100,000 in stock for your box and patents and make you chief electrician of a company I will organize to handle your 'phone."

"I'll take your offer," the inventor eagerly cried, as he reached out his bony hand to receive the crisp new bill that fell from the lily-like fingers of the giver.

• • • • • • •

That night at the Slick Men's Club the Svengali Autobuncos Telephone Company was organized with Mr. P. R. O. Moter as president and general manager. The capital stock was fixed at $100,000,000 with privilege to increase. The president was authorized to employ ten agents in each State and Territory to sell stock at the minimum price of 20 c. per share, and territorial rights for the use of the Svengali telephone by local companies at a rate of $7 per square mile of territory.

* * *

Business Hints.

We call the particular attention of our constituents to a new departure in ELECTRICITY—Business Hints. It has been introduced at considerable expense, and we have no doubt will be fully appreciated by a large number of hustlers.

It is with pardonable pride that we point out the difference between ELECTRICITY and our contemporaries in all the departments which spread before the trade opportunities for new business. We are not only ahead of any single competitor, but present fuller information each week than is given by all our competitors combined. Every reader can demonstrate this fact to his own satisfaction.

* * *

A G. E. LAND SCHEME.

(From a Schenectady dispatch in the Daily Press.)

Schenectady, N. Y., May 31.—It is asserted here that the General Electric Company has been offered 100 acres of land and $1,000,000 in cash to consolidate all its factories at one place in New Jersey. The company's engineers have reported that the saving of expense by consolidating the factories at some point near Philadelphia or New York would offset the loss which would result from selling their present factories.

This deal was reported in ELECTRICITY over a year ago. The syndicate referred to is composed of Elmira men, and owns a large tract of land at Elizabethport. If the trade is ever made, and possibly if it is not made, Messrs. Coffin, Griffin, Rice, Crosby and others will be called upon to explain how much cash and how much stock in the land company they were promised for their efforts.

* * *

The Brush Company.

On May 25 the Brush Electric Company of Cleveland gave to the G. E. Company a chattel mortgage on the property of the Swan Lamp Company for $30,000 due in thirty days.

We respectfully remind our esteemed contemporaries, the *Western Electrician*, the Cleveland *Leader* and the *Plaindealer*, that Messrs. Ord and Smedberg, the officers who were appointed for the purpose, have already begun the necessary work of closing up the Brush matters in Cleveland preparatory to the transfer of the entire business to Schenectady.

We do not think that Mr. S. M. Hamill would *now* put his signature to a statement that "if the Brush works are to be closed he has not heard of it."

From the removal of Messrs. Lawrence and Miles, we take it that the policy of giving away Brush apparatus in order to sell National carbons at a good price was not viewed with favor at the corner of Broad and Wall streets.

* * *

WE are pleased to record the marriage of our esteemed contemporary, Mr. Stephen Leidy Coles, and Miss Sallie E. Field, which took place on Saturday, June 1, in this city.

We salute Mr. Coles and bespeak him the full happiness which he deserves. A man is not a man until he is married.

To those students who desire to ascertain how near imbecility a "scientific" journal may go and still exist, we commend a careful reading of the editorial in last week's *Electrical Engineer* entitled "Buffalo Blindness." We shall have more to say of this next week, meantime we quote: "Apparently as fast as a new generator gets into place, a local consumer of the power starts up at Niagara." If this is so, it is susceptiable of proof that the consumer starts up quicker than the power itself. The Hous-Kennooley-Martini-Wetzleery combination were already on record to a degree sufficient to cause much subsequent and honest mortification to that beautiful bird the Unit Shark. Why should any member of the quartette again bring up the past in this way? Frankfort Lauffen, Telluride, and Sacramento cited as comparisons! Fiddlesticks, tiddledewinks and softsoap!

* * *

Our issue of May 15 *is exhausted, and we will be under obligations to some of our friends who will return us copies of that date.*

* * *

The G. E. Underground System.

(From the New York World.)

At 10 o'clock last evening, just as car No. 503 had crossed 125th street, there was a flash of fire under the car and the woodwork began to burn. The car was well filled with passengers and they tumbled out of the car from both ends. The motor was burned out. The car was pushed to the depot by another.

* * *

The Electric Construction and Supply Co.

To the Editor of ELECTRICITY.

DEAR SIR: I note your remarks on the affairs of the above company last week, and quite agree with you that such exposures are wholesome and for the public good. But how can you hold that the active managers, Messrs. Torrey and Corey are free from criticism? Yours truly,

CORTLANDT STREET.

We have not held that either one of these gentlemen is free from criticism. He is not. What we did say was that the charge of *dishonesty* in connection with the affairs of this company could not be made against either of them, and that in the grand scramble of the insiders to protect themselves neither of these gentlemen had any part. There is no doubt that Mr. Corey committed some serious mistakes, the chief of which was staying with the company at all when he knew the way it was drifting and when he was general manager only in name.

There are certain faults and human weaknesses which may under certain conditions become proper subjects of newspaper criticism; there are others which are not proper subjects for such criticism. If a man's "weakness" leads him to fail in business and protect himself by devious methods at the expense of his creditors, then it should be made more difficult for him again to engage in business and perhaps repeat the performance.

But if a man's administration of his affairs is extravagant, slipshod and careless as to details, if he allows his business to run him instead of his running the business, we do not see that a newspaper has any right to publicly call attention to his defects.—ED.

* * *

G. E. STOCKJOBBERS have again used the old story that the company is about to take a contract for the equipment of the Manhattan elevated system. Col. F. K. Hain, the general manager, says he knows nothing about it. This shows that Col. Hain is behind the times. Mr. Charles Truthful Hughes, of the G. E. Company, says he has submitted estimates. Of course this is all that is necessary.

Partnership Dissolved.

The firm of Warren & Lozier, contractors and engineers, has been dissolved by mutual consent. Mr. R. T. Lozier will sail for Europe within a few days.

The Telephone Situation.

Wondrous Growth of the Independent Companies.

With Competing Exchanges Established the People Get Lower Rates and Better Service.

The biggest, ugliest and sharpest thorn in the side of the American Bell Telephone Company to-day is the independent telephone exchange.

It is nowhere on record that the Bell Company has borne evidence to the truthfulness of this assertion, but that in no wise impairs the strength of the statement. In fact, the efforts of the Bell Company to prevent the independent exchange companies from obtaining a foothold renders an admission on the part of the New England company altogether superfluous.

In some places, where the local companies lacked the backbone to stand up for their rights the hostile policy of the Bell Company worked, and the so-called independent companies have died in a spasm of fright. In other towns the local companies were organized with courageous men at the head. They were on the ground to do business, not to sell stock or speculate in franchises. Neither were they afraid to fight America's strongest monopoly. They went ahead regardless of threats and intimidations, built exchanges, and to-day are giving a service more satisfactory than that of the Bell Company and at about half the cost to subscribers. Through the determined stand taken by these local companies, organized on a legitimate basis and for legitimate purposes, a form of opposition has arisen that promises, sooner or later, to very seriously curtail the business of the New England company which for seventeen years has enjoyed the fruits of patent monopoly to the full. It means more than that even. The organization of these local companies in scores of prosperous towns and cities begets the hope that the telephone business will, at no distant day, be conducted on a broad, honest and liberal basis.

Being utterly unable, by all the means known to its power, to stay the rising tide of progress of the independent telephone exchange companies, the Bell Company has sought to belittle the accomplishments of these companies. The agents of the Bell, and its sub-companies, have sought everywhere and at all times to create the impression that the competition of the independent exchange companies will amount to nothing.

It is represented that these competing exchanges are confined to small towns; that the service is not only unsatisfactory but is merely local in character. It is contended that no combination of capital is, or can be, made strong enough to equip a service rivalling that of the Bell Company in either efficiency or extent. It has been maintained, with no small degree of complacent satisfaction on the part of the Bell Company's experts, that a telephone equal to the Bell instrument cannot be made without infringing upon some of the chestfull of Bell patents. The company has been indefatigable in its dissemination of the New England telephone doctrine that the microphone transmitter, like infant baptism, is essential to telephone salvation.

A host of shrewd inventors have prepared a revision of the telephone creed, and the results elsewhere noted in these columns demonstrate how far the microphonists are behind the times.

A rude awakening awaits these wise men of the East, who have concluded with becoming modesty that notwithstanding the expiration of patents, decisions of courts, mutations of time and progress of inventions, they can continue to spread over the whole continent.

Instances have already been cited in these columns which serve to show the radical reductions in rates made by the Bell Company, often in the vain hope that it would be able to hold its local subscribers. Supplementary to what has already been published, and serving better in some respects to illustrate the efforts of the Bell Company to head off the independent exchange companies, a review of the situation in the State of Michigan is apropos.

When the Harrison Company began making contracts at Port Huron at $30 and $24 per year, the Bell Company dropped to $24 and $18, and offered to give a rebate of a month and a half to all who would continue as subscribers for three months from April 1. At Escanaba George W. French, with a capital of a few dollars and plenty of Michigan grit and get-there, drove the Bell Company, with a 100 drop exchange, out of the place, and to day is giving a satisfactory service for $24 and $18 per year to more subscribers than the Bell Company had.

The Gilliland Company has secured a franchise at Benton Harbor, agreeing to give service at $2 and $1 per month. This has brought the Bell Company down to $3 and $2.50, a reduction of $1 per month. The Gilliland plant will be built. The Marquette Telephone Company has proposed to give service in Ishpeming at $30 and $15 per year. To get down to these rates the Bell Company had to cut their's in two in the middle. Mere rumor of an opposition company at Ironwood sent Bell rates from $60 down to $36 per year. The Harrison Company has a franchise in Grand Rapids and expects to open its exchange with 1,200 subscribers. The Bell Company has already reduced rates from $48 and $70 to $36 and $50 for private subscribers, but with still greater reductions to municipal officials whose influence it hopes to retain in its fight. The business men of Manistee have organized a company and are prepared to install a Gilliland plant with rates at $24 and $18 per year. The cut of the Bell Company from $50 and $25 to $36 and $20 hasn't scared the local company a bit.

At Holland the Bell Company made a flat rate of $12 per year to all subscribers in the hope of freezing out the local company. The outcome has been that the local company has sixty-two subscribers and the Bell thirty. The Bell rates, before the local company entered the field, were $48 and $36.

The establishment of a Strowger Automatic Exchange plant at Ypsilanti, brought Bell rates from $48 to $30. At Cadillac the Bell Company was routed, horse, foot and dragoons. Henry W. Sill installed an exchange of the Chase system, selling the instruments outright to subscribers and charging $18 a year for exchange service. There is not a Bell instrument left in the town, and the new exchange has four times as many subscribers as the old one.

In Jackson, Three Rivers, Calumet, Kalamazoo, Ithaca, Charlotte, Ionia, Petoskey, Traverse City, Charlevoix, Marshall, Saginaw, Grand Haven, Vassar, St. Clair, Menominee, St. Johns, Sault Ste. Marie. Mt. Clemens, Owasso, Ludington, Adrian, Hillsdale, Lansing, Flint and all other towns in the State where competing companies have been organized, or even proposed, the Bell companies have cut rates from 25 to 50 per cent. In the city of Detroit, where no organized competition has yet arisen, the same old rates hold good.

Instances of reduced rates could be multiplied without end, but those above given serve admirably to show how much alarmed the Bell Company has become over the initial progress of the independent exchange movement.

The greatest activity in the organization of independent telephone exchange companies has thus far been in the Central and Southern States. Almost every town of 3,000 or more inhabitants now has its local telephone company. Franchises have been secured and active preparations are making to install an exchange service. In the large cities progress has been necessarily slow. The Bell Company has become so strongly entrenched and has such a strong pull with the municipal authorities that in many cases it is difficult for an opposition company to obtain a foothold. But even this has not deterred the onward march of the independent movement, and there are but few cities to-day in which local anti-Bell companies, with money and brains behind them, have not been organized and active steps taken to secure the necessary rights and franchises. The threadbare argument of the Bell Company, that there is no perfect instrument but the Bell and not sufficient capital to install a rival service, no longer carries weight among up-to-date business men.

Neither do threats and intimidations frighten them. When such astute and conservative business men as Smith M. Weed, Dr. W. Seward Webb, J. Wesley Allison, Silas B. Dutcher, Henry N. Whitney, John C. McGuire, A. B. Acklin, David A. Boody, John Jacob Astor, Charles F. Cox, and others of New York, identify themselves with the active management of an independent exchange company, it is safe to to assume that they have faith in the business. It shows, moreover, that in the large cities, the present citadels of the Bell Company, it is confronted with an enemy quite as well equipped as itself.

The above-named gentlemen comprise the directorate of the Mutual Automatic Telephone Company of New York, organized with a capital of $6,000,000, to establish a local exchange service in New York City. The Strowger Automatic Exchange, and the Hunnings transmitter will be used. Contracts are now being made on the maximum basis of $120 per year. Just so soon as a sufficient number of subscribers have been secured; the work of installing the plant will begin.

In Philadelphia a similarly organized company has already secured franchises. In Buffalo the local company is making five-year contracts. In Chicago, St. Louis, Pittsburg, Detroit, and a host of other large cities, independent companies with ample capital are already in the field.

The Home Telephone Company, organized in Baltimore, has already secured a large number of subscribers on three year contracts in that city. The new company will operate the Drawbaugh patents and will give a service at much lower rates than the local Bell Company. Franklin Noble, of New York, is president and organizer of the new company.

In spite of the threats, reduction in rates, manipulations of municipal governments and other practices common to a certain species of New England electrical financiers, the work of organizing local companies and installing competing exchanges has gone on apace. The net result of this contest between a bulldozing method of preventing business and an honest effort to promote it is that the independent exchange industry has attained proportions largely exceeding the expectations of the most sanguine promoters. The electrical fraternity has heard much of this branch of the business, but positive or accurate information of its magnitude has been acquired by very few.

At the expense of considerable time and trouble, ELECTRICITY has collected data which enable it to show to the telephone trade, for the first time, the true status of the independent telephone business throughout the United States.

While the companies manufacturing telephone instruments and parts are now legion, there are comparatively few that make a business of erecting and equipping complete telephone exchange plants.

Of these the Western Telephone Construction Company, the Harrison International Telephone Construction Company, the Gilliland Telephone Company, and the Strowger Automatic Telephone Exchange, of Chicago; the Mason Telephone Company, Richmond, Va.; the National Telephone Company, Boston; the American Electric Telephone Company, Kokomo, Ind., are perhaps the leading ones, particularly in volume of business done.

Of the many other companies now in the field the greater number have confined their attention to the manufacture and sale of telephone sets and parts and the installation of private lines and interior telephones, though many of them have done exchange work on a small scale.

The Western Telephone Construction Company of Chicago has established exchanges as follows:

Newark, O., 300 'phones; Winona, Minn., 300; Johnstown, Pa., 200; Mattoon, Ill., 200; Van Wert, O., 150; Webster City, Ia., 100; Hartford City, Ind., 100; Mt. Vernon, O., 200; Petaluma, Cal., 100; Fostoria, O., 200; Decatur, Ind., 100; Greensboro, N. C., 100; Selma, Ala., 150; Santa Fe, N. M., 100; Beaumont, Tex., 100; Rushville, Ind., 150; Navasota, Tex., 100; Manistique, Mich., 50; Washington, Ia., 100; Maryville, Tenn., 50; Cambridge, O., 200; Russellville, Ky., 50; Waxahachie, Tex., 100; Two Rivers, Wis., 50; Columbia, Mo., 100; Palestine, Tex., 150; Marysville, O., 100; Salisbury, N. C., 100; Perry, N. Y., 50; Palatka, Fla., 100; Askaloosa, Ia., 300; Keithsburg, Ill.; Butler, O.; Fredericksburg, and several others.

This is no doubt the best showing made by any of the independent companies. The system of the Western Company has been subject to long tests and has proved itself to be in many respects superior to the Bell system. This company has no stock to sell and is engaged exclusively in the manufacture and sale of telephone apparatus.

The Mason Telephone Company of Richmond, Va., has equipped the following exchanges with its instruments and apparatus:

Lynchburg, Va., 400 'phones; Waynesville, N. C., 30; Petersburg, Va., 300; Hanover, Pa., 150; McKeesport, Pa., 70; Anderson, S. C., 100; Rock Hill, S. C., 100; Sumter, S. C., 75; Cleveland, Tenn., 50; Marion, Ala., 50; Bryan, Tex., 150; Greenville, Tex., 200; Camden, Ark., 50, and others in Southern and Central States.

The Gilliland Telephone Company has installed an exchange with 150 subscribers at Niles, Mich., and has closed a contract for an exchange of 275 subscribers at Manistee, Mich. This company has secured franchise rights at Benton Harbor and St. Joseph, Mich., South Bend, Ind., and in many other towns in the northern central States.

The American Electric Telephone Company states that it has established one hundred exchanges, the largest of which is in Topeka, Kan. The Harrison International Telephone Construction Company claims to have established upwards of sixty exchanges.

The National Telephone Manufacturing Company and the Strowger Automatic Telephone Exchange furnish no statement of the exchange work done by them.

The data given above does not include the thousands of instruments for private lines, but only those exchanges completed and in actual operation. All of the telephone construction companies named have a large number of contracts already closed and many being negotiated, as well as many exchanges in process of erection which have not been included in the above list. The number of small exchanges installed by contracting and not manufacturing companies cannot be even approximately ascertained. From all the data at hand a very conservative estimate of the instruments now in use in the independent exchanges places the number at upwards of 100,000.

In face of the most bitter opposition of the Bell Company, perplexing uncertainty as to infringement suits, unfavorable business conditions, and a thousand and one other difficulties that have stood in the way, it is really remarkable that such headway has been made by the independent companies in the short period of practically only eight months. The number of independent exchange instruments now in use is about one-fifth of the number the Bell Company, with an unobstructed field, has been able to install during all the years of its existence.

The establishment of independent exchanges cannot be said to have fairly begun, yet there is not to day a sound telephone manufacturing company in the country that is not hundreds of instruments behind in its orders. The organization of local exchange companies goes on everywhere. The new exchanges in operation have demonstrated that an efficient and satisfactory service can be furnished by other instruments than the Bell and at a lower cost and with an entire absence of arbitrary conditions. The people are determined to have such a service, and in almost every town and city of the country there are energetic, level-headed business men forming themselves into companies to buy and install an exchange system of their own. These are the people who are causing more concern to the occupants of a certain office in Boston than any adverse patent decision or hostile acts of legislatures.

The feelings of mistrust and doubt prevalent among prospective telephone buyers, due largely to patent complications, have naturally been fostered rather than allayed or dispelled by the Bell Company. Each succeeding patent decision has created more or less distrust of a successful independent telephone business, but happily for the trade this feeling is giving way to one of confidence as the situation becomes better or more clearly understood. The most recent decision in the Berliner case, which at first was thought might seriously retard the growth of the independent telephone business, promises rather to have a stimulating effect. Even should it be established that the Berliner microphone patent of 1891 is valid, and that it is not to be annulled, the consequences will by no means be disastrous to the independent business. It will bring more prominently to public attention the fact that there are instruments made and now in operation which are not only absolutely non-infringing but superior in every respect to the now somewhat out of date Bell instruments.

As soon as the telephone buying public becomes convinced of these facts then it will want these instruments.

There is no section of the country in which there is not a strong feeling among the people in favor of an independent telephone service. There is no stronger evidence of this than is shown by the constantly increasing number of new local telephone companies. In some places the Berliner decision has had an adverse effect, but such instances form the exception and not the rule. There is everywhere a disposition to accord to the Bell Company a full measure of credit for its great achievements in telephony, yet quite as strong is the feeling that it is both unjust and unfair for it to seek to perpetuate a monopoly through a manipulation of patents. To this latter fact, and to excessively high rates, more than to a well-founded complaint of an unsatisfactory service, may be attributed the already vigorous growth of an independent telephone business.

As will be observed from the announcements in the advertising columns of Electricity, the claim of the Bell Company that the Berliner decision gives them a monopoly of the telephone business until 1908 is not only a gratuitous assumption, but it is a statement which is controverted by such influential independent companies as the Western Telephone Construction Company, the American Electric Telephone Company and the United States Telephone Company. The Western Company manufacture a line of apparatus for which they make the absolute claim that "it does not infringe any patent owned by the Bell Company." The American Company manufacture the Hunnings dust transmitter, which "does not depend upon variable pressure between electrodes in constant contact," hence does not infringe the Bell patents. The United States Company of Philadelphia, a new comer in the telephone manufacturing field, owns and controls the "Make and Break" patents "covering all possible forms of battery transmitters in which the electrodes are not in constant contact, and are not affected in any way by the Berliner transmitter patent."

To ascertain the effect of the Berliner decision and to learn what the prospects for the independent companies may be in various sections of the country, Electricity has secured from several special correspondents a review of the local situations.

From Chicago our correspondent writes:

"The recent decision of the Circuit Court of Appeals reversing Judge Carpenter's finding in the Berliner case has, of course, created much speculation. We find a great many manufacturers disposed to feel quite discouraged while others treat the matter with extreme indifference. The Bell Company's position is certainly strengthened so far as bluffing is concerned, but as the United States Supreme Court practically passed upon the matter, in view of the recent Bates Refrigerator decision, it is very hard to understand in what way the Bell Company's position is strengthened by their last victory.

"Throughout the North and West we find a decided disposition on the part of the residents of the smaller towns and cities to disregard the Bell claims entirely. They are tired of the service and the treatment received during the past, and having this prominently before them, they are even ignoring reduced rates which the Bell company make, and pay little, if any, attention to the arguments put forward by the Bell Company's representatives.

"At all points where we find people in this mood there are few difficulties to be overcome, and as a rule companies composed of the best men in the community are organized and the enterprise is invariably backed with determination, energy and money. These companies are awarding contracts for exchange construction and the purchase of apparatus and usually begin business with about twice the number of subscribers formerly having telephone service.

"We occasionally strike communities where, owing to want of interest or lack of money, it is impossible to enlist the citizens in a new telephone company. At these points little, if any, effort is wasted, and in cases where the Bell Company has made reduced rates it is really not worth the while to work up an organization. It will come sooner or later.

"One great difficulty which companies of reputation and means have to overcome is the amount of inferior and cheap apparatus put upon the market by people of comparatively no experience and little capital. It is true that their work is largely confined to interior service and short line installation, but it is really a very important class of telephone work and should be of a first-class character.

"We find that purchasers, as a rule, do not bother themselves very much about patents provided the instruments are satisfactory in service.

"Our company has recently closed some good contracts for switchboards, apparatus and construction work, which are very encouraging and afford every reason for anticipating a large and successful telephone business from this time on."

From Wisconsin come encouraging reports. Our correspondent at Milwaukee writes:

"There is a good opening in this State for independent telephone companies. Investors are still a little afraid of going into the business extensively until the situation has cleared. The Bell Company has reduced rates in the interior of the State but has not as yet made any reduction in this city, although one is momentarily 'threatened.' The prospects for private and interior installations are very good, the demand for telephones for this class of service being quite active.

"The Wisconsin Telephone Company so far has the only franchise in this city and owns the long distance line to the interior of the State. There are many prosperous cities and towns throughout the State in which a first-class telephone exchange is badly wanted. There is no doubt but that a good pushing company using a good instrument and charging reasonable rates, would find a very profitable field in this State."

With the characteristic discernment of the average Westerner, the people of Indiana are reposing confidence in the good companies, as is shown by the following from Indianapolis:

"The telephone situation in this section is very promising. There is considerable construction now under way. There is a widespread feeling of confidence by the people in those independent companies which are composed of men of sound principles.

"The Bell Company has done nothing to choke off competition except to reduce the cost of service and in some cases offer free service. This serves no better purpose than to show exactly where the Bell Company stands and how much it thinks its service is worth.

"The Indianapolis Electric Company reports that it has been all the way from 50 to 450 telephones behind in its orders for the past sixty days, and while rapidly catching up, is some 175 'phones behind yet. This company has a capacity of fifty complete telephones per day, and is only taking orders to be delivered within sixty days."

In the far West competition has not yet advanced beyond the talking stage except in a few places. In Trinidad, Col., the recent Berliner decision put a damper on the independent movement. Our Denver correspondent writes:

"The Bell Company has strengthened its position largely in the last year or two by connecting Denver by long distance system with nearly all of the important towns in the State. It is understood that their policy is to continue this extension. They have also added to their strength by putting automatic exchanges in towns not large enough to justify the use of an exchange with a resident operator."

The most determined and most thoroughly organized opposition to the Bell Company has developed in the State of Ohio. Here an organization of the local telephone companies has been formed under the name of the Ohio Telephone Association with James M. Thomas of Chillicothe as president. The association is to comprise the companies already organized, or to be organized, in the larger towns and county seats. It is proposed to connect these towns by an extension of local lines and eventually form an inter-connected system covering the whole State. Upwards of seventy-five companies are already members of the federation.

In Cleveland the Berliner decision has had an effect somewhat similar to the recent frost that killed the Buckeye fruit crop. Our correspondent writes:

"The prospects for the independent telephone companies have received considerable of a blight by the recent decision. The Union Electric Company had a number of orders countermanded, the purchasers fearing suits for infringement. The local manager of the Bell Company states that the effect will be to stop outside companies from manufacturing telephones or be guilty of infringement."

In the vicinity of Cincinnati, like other sections in the West, the independent trade received quite an impetus after the decision of Judge Carpenter. A large number of companies were organized and many plants have been built. "There is something of a lull," our correspondent writes, "since the decision of the Court of Appeals, but there is no disposition on the part of those who have taken hold of the business to let go. It seems only to have intimidated capitalists who have contemplated, but not yet made, actual investments in the business. The business, properly handled, promises to be healthy and profitable to the promoters, and highly beneficial to the business public on account of reduced prices and improved service and facilities. The interest taken and the capital invested have pushed things vigorously."

The Southern States are being invaded by the independent companies, a number of exchanges having been installed, and many others are already contracted for. The Harrison Company is actively engaged in this territory organizing local companies and securing franchise rights.

There is considerable dissatisfaction with the Bell service at different points. At Birmingham, Ala., the Bell Company until recently charged $65 per year in the first quarter mile limit but have now added $5 for each additional quarter mile from the telephone station. Thus a subscriber two miles distant from the central station has to pay $26 per quarter. An independent company has secured a large list of subscribers for an opposition exchange at a $30 yearly rate, and has been granted a franchise by the city council. The Bell Company immediately showed antagonism and announced that it would put prices down to a point that would break the opposition. If low rates did not accomplish this the company expressed a determination to give free service for a period. Just now the opposition is waiting developments. The business men of the city have warmly encouraged the new company and are anxious that the independent service be established.

The Berliner decision has created no uneasiness whatever among the independent telephone companies in New York. Without exception they state they are not only ready to take new orders but are filling those already taken just as if nothing had happened. It is the general expectation that the business will gradually increase in volume as the situation becomes better understood.

Thurlow Weed Barnes, president of the Standard Telephone Company, is the authority for the statements that the capital stock of the company is ready to be issued, that the company has given orders for the manufacture of 10,000 telephones and will commence to string wires this month. President Barnes says that the company will oppose the Bell Company and that the stories in circulation to the effect that the Standard Company is a "decoy" of the Bell Company are untrue. He says that the 52 sub-companies of the Standard Company are thoroughly organized and already in the field.

J. Wesley Allison, president of the Mutual Automatic Telephone Company, when asked what effect the Berliner decision would have upon his company, said:

"Really it has had no effect whatever upon us. We are going along with our work just the same as ever. It is a disputed question whether the Bell people have exclusive rights in the battery transmitter principle, and we will find out about that."

THE PENNOCK ELECTRIC SYSTEM.[*]

BY J. J. SWANN.

About every so often the newspaper public is startled by reading of some remarkable discovery in electricity which will revolutionize the world. The large majority of such schemes never go farther than a few columns of newspaper talk, after which they die from some more or less good reason. The Pennock System is an exception to this general rule and in the hands of Mr. George B. Pennock, its inventor, still exists in a very flourishing condition, if dependence can be placed in the prospectus issued by the company. Generally speaking, it is wisest to pay no attention to revolutionists in electrical as well as in civil life until they reach a certain danger limit. The claims of Mr. Pennock and his associates are, however, so sublime and certain, that they have reached this limit and cannot be ignored—besides the system brings out several interesting points worthy of notice.

To begin with, if we have a current of sufficient strength to heat the carbon of an incandescent lamp, and reverse it slowly, the carbon is alternately heated and cooled. As the periodicity increases the flickers grow more and more frequent until at about 30 per second, or 1,800 per minute, the flashes blend and the light becomes constant as far as the eye can detect. In practice, about 50 periods per second are used, giving a clear smooth light.

If instead of alternating the current we simply make and break a direct current, the same effects are produced, flashes growing more and more frequent as the speed of the contact-making device is increased, until, at about 2,000 per minute, a steady light is produced, which, as far as can be seen, is the same as that of the alternating lamp. An ordinary induction coil with a lamp in series with the primary will show this. And it might be interesting to note that this method can be used to regulate the candle power of lamps; for, by varying the speed of the contact-maker, the light may be varied from nothing to full candle power—the current changing in direct proportion to the speed.

The foregoing explanation regarding alternating and pulsating currents will be clearer if we remember that all direct currents are more or less pulsating. Thus we see that lamps can be run in the ordinary way—in series or in multiple—on a pulsating as well as on an alternating current.

It is at this point Mr. Pennock steps in with an instrument or machine he calls a Voltage Distributor. To avoid mistakes the following is quoted from his patent: "The object of my invention is to provide a means of distributing an electric current from the same source of supply to a number of distinct and independent electric circuits, for the purpose of supplying lamps, motors, etc., with currents of the necessary electromotive force, so that no matter what change is made in one circuit it will have no effect in or on any of the other circuits, and no matter at what potential the current is kept in one circuit, an altogether different potential can be kept in the other circuits, depending altogether on the resistance of each individual circuit. I attain this object, first, by means of a rapidly rotating mechanism, arranged to send a current of electricity through a number of different circuits in rapid succession, combined with any source of electric power, but preferably with a primary battery or batteries. . . .

---

[*] From a paper read before the Electrical Society of Cornell University, in *The Sibley Journal of Engineering*.

. . . A rapidly rotated metal arm is arranged to come in contact in rapid succession with a number of metal disks or segments arranged in a circle on a fire-proof non-metallic plate, such as slate, marble or similar substance.

. . One end of each circuit is connected to one of the segments, and the other end to a general return wire. The battery is connected, one pole to the general return wire and the other to the rotating arm. Now, by rotating the arm very rapidly, a current of electricity is kept flowing through the different circuits without any appreciable break, and, as the circuits are completely independent of each other, the resistance and current in each circuit can be regulated to suit its individual requirements irrespective of the others; and throwing on or off the lamps in one or more of the circuits will have no effect on the lamps in the remaining circuits. Two thousand interruptions of the current per minute in an incandescent lamp will deceive the eye into the belief that the light remains stationary—that is, the current leaves the lamp for an instant and returns to it again. Thus, so far as the eye can detect or the motor effects inform us, so rapid is the intermittent transference of electrical force that the power may practically be said to be in a hundred places at once, exerting its full capacity."

So far we will allow that nothing particularly remarkable has been encountered, although some might dispute several statements just made.

The next step launches us into the supernatural, for Mr. Pennock states that all these lamps connected to his Voltage Distributor, whether 10 or 10,000, can be illuminated to full candle power with the current of one lamp. The explanation of this claim is given as follows: As the revolving brush is in contact with only one segment at a time and we have only one lamp connected to each segment, it is evident that no more current can flow in any one of the circuits than the lamp and circuit resistance will admit. As the arm revolves, circuit after circuit is completed, but no more than one circuit at a time is receiving current. Thus we have just as many lamps as segments illuminated with the current of one lamp. In case several lamps in multiple are connected to one segment, the current will be only what one circuit would require. To operate motors, cars, etc., the same device is used, the motor being inserted just as a lamp would be.

In a test of this system made May 4, 1895, in the Physical Laboratory, Cornell University, the following results were obtained: A circular brass disk was constructed and sliced into 10 segments. An arm provided with a brush was revolved at speeds varying from 0 to 5,000. The candle power figures are not absolute, since no photometric measurements were made. In fact such were unnecessary, for the differences were only too apparent.

Each segment and the arm were connected with a binding post for convenience in handling. To start with, one lamp was connected to segment (1)—the circuit being from line through the lamp to (1), thence through arm to the other line, each time it touched on (1) in its revolution. Placing the brush on (1) and starting while the lamp was at full C. P., the instant the brush left the segment the lamp flashed quite perceptibly until a speed of about 1,800 was reached, when the carbon assumed a steady glow, though scarcely more than a dull red. Increasing the speed gradually to even 5,000 revolutions made no appreciable difference in the C. P., current readings remaining practically constant. Connecting (1) and (2) so current was flowing for $\frac{2}{10}$ of a revolution, the C. P. increased a small amount but remained constant with varying speeds as before. By adding one segment each time and thus allowing currents to flow for $\frac{1}{10}$ of a revolution more for each segment added, the light increased with each addition, remaining constant regardless of speed.

Trying different combinations of segments, such as every other one (1—3—5—7—9), every third one (1—4—7—10), etc., produced no change. The C. P. in each instance depended only on the number of segments connected and not on their relative position.

Connecting one lamp to each segment and repeating, increasing speeds as before, each lamp acted as first explained, giving only $\frac{1}{10}$ its C. P., the sum just equaling the light of one lamp. Connecting lamps to two segments, making 5 in all, each lamp emitted $\frac{2}{10}$ its C. P.—the five giving $\frac{10}{10}$ or equaling one lamp.

No of lamps.	Ratio of contact.	Equivalent No.
10	$\frac{1}{10}$	1 lamp
5	$\frac{2}{10}$	1 "
2	$\frac{5}{10}$	1 "
1	$\frac{10}{10}$	1 "

The same will be true of 100 segments, and so on, limited only by mechanical difficulties. In any and all cases the light obtained per lamp varies directly as the ratio $\frac{c}{2\pi}$, where c is the angle through which contact is made. As c increases, the fraction approaches 1 as a limit, or when $c = 2\pi$, $\frac{c}{2\pi} = 1$, or we are getting current for one lamp. As c decreases, the light decreases until $c = 0$, when no light is given out. The same holds true in the case of motors or any other electrical machinery.

We now have data for solving the problem. Suppose we take a 50 light machine, 110 volts. Under ordinary circumstances this would run fifty 110 volt lamps each giving 16 C. P This means $.6 \times 50 \times 110 = 3{,}300$ watts and 800 C. P. Let us connect our dynamo to a V. D., and, as has been shown, if we wish to light 100 lamps, each lamp will get one-half its current and give one half its C. P., or $100 \times .3 \times 110 = 3{,}300$ watts and $100 \times 8 = 800$ C. P., exactly the same as before. Of course our lamps will burn dimly. If, however, we substitute 100 100-volt 10 C. P. lamps we will have 100 lamps burning brightly, but still only 800 C. P. The difference in size between a 10 C. P. and a 16 C. P. lamp is small, so the layman is greatly impressed by the brilliant light.

Personal.

Mr. E. R. Gilman of Chicago was in New York last week.

Among our welcome visitors on Monday was Mr. B. M. Barr, of the Walker Company, Cleveland.

Mr. F. G. Fuller has retired from his connection with the Day's Kerite sales office.

Mr. J. B. Crouse, senior member of the firm of Crouse & Tremaine, Fostoria, was in New York recently on a business trip.

A Pittsburg Power-Plant Scheme.

According to the *Commercial Gazette*, it is proposed to do away with the smoke nuisance in Pittsburg by erecting at some convenient coal mine a mammoth electric power plant to furnish the city with current for electric lighting, heating and power, thus entirely doing away with the burning of coal in and immediately about Pittsburg. It is thought by Mr. Robert Marshall of the firm of Marshall Bros., elevator builders, the originator of the scheme, that electricity could be furnished from such a plant cheaper than power could be generated in isolated city plants.

BOOK REVIEWS.

STREET RAILWAY INVESTMENTS. A STUDY IN VALUES. By EDWARD E. HIGGINS. 102 pp., 8vo. New York: Street Railway Publishing Company.

There are few if any who have given the subject of street railway investments the intelligent study that the author of this book has given it, and there is certainly no one who can speak with more authority on this subject than he. With the advent of the electric railroad the stocks and bonds of street railroads, both projected and in operation, have taken on a new interest to the investing public, and the rich promises of reward have led many into ill-judged investments. While there is probably no class of bonds and stocks which is safer than those under discussion, when judiciously chosen, it is often difficult for the layman to decide intelligently between the good and the bad. Mr. Higgins's book comes to the assistance of such and will be welcomed wherever it is known. He divides the securities now in existence into classes representing:

1st. The purchase or valuation of the old horse railway properties at a large advance on their original costs.

2d. The reconstruction and re-equipment of such properties, accompanying a change of motive power, at a cost usually in excess of that for which the same or superior work could now be done.

3d. The extension of the re-organized properties into new territory.

4th. The development of entirely new properties in unoccupied territory.

5th. Construction, promotion, banking and brokerage profits.

And after stating that the vast sums which have been drawn from other investment channels are exciting some uneasiness in conservative financial circles, he gives the keynote of the book as aiming to assist in separating the good from the bad—speculative from investment values.

He believes that it is not impossible to lay down certain principles which will serve to determine the limits of success in particular cases, and to establish the broad lines of a "theory of values" in this comparatively unknown financial field.

The book is divided into ten chapters and an appendix, in which are separately discussed surface railways in American cities and towns of less than fifteen thousand inhabitants, in those of from fifteen thousand to twenty-five thousand, twenty-five thousand to thirty-five thousand, thirty-five thousand to fifty thousand, fifty thousand to one hundred thousand, one hundred thousand to five hundred thousand, and surface and elevated railways in American cities of over five hundred thousand inhabitants. One chapter is devoted to interurban railways, and in a pocket in the back of the book is a most elaborate table of statistics which is explained in an appendix.

The work is a small one, but compressed within its space is a very large amount of data which it would be difficult to obtain elsewhere, and this seems to have been collected with extreme care and good judgment. Those interested or likely to become interested in investments of this kind will find this book a most welcome guide to their judgment, and can rely upon everything as authentic which the author offers as such. We most heartily commend the book to all who are interested in the subject of street railway investments as the most intelligent and reliable treatment of the subject thus far attempted.

The Hollenden Hotel.

We have received from Mr. Frank Brobst, manager of the Hollenden Hotel at Cleveland, a magnificent photographic view of the lobby which is so familiar to electrical men. It is neatly framed and now adorns the walls of ELECTRICITY's sanctum.

General News.

What is Going on in the Electrical World.

Worthington, Minn.—A vote will be taken here the present month on the question of electric lighting.

Grand Ledge, Mich.—The city council has awarded the electric light contract to the Westinghouse Company.

Belfast, Me.—The question of building an electric railroad in this city parallel with the river is being agitated.

Le Mars, Iowa.—The project of an electric railway line between Le Mars and Sioux City is again being agitated.

Vicksburg, Miss.—The Mayor has been authorized by the city council to advertise for bids for electric lighting.

San Francisco, Cal.—Ground has been broken for a new electric road from West Berkeley to the foothills near Piedmont.

Defiance, O.—The electric light and power house here was damaged by fire May 24 to the extent of $6,000. The loss is fully covered.

Barton, Vt.—This village has voted to issue bonds to the amount of $10,000 for the purpose of putting in an electric light plant.

Venice, Ill.—Tracklaying is in progress on the new street railway to Granite City. The road will be completed about the 1st of July.

Braintree, Mass.—Joel F. Sheppard, of East Braintree, has been elected president of the Braintree, Randolph and Holbrook electric road

Rome, N. Y.—The city council has granted the Rome City Street Railway Company permission to change its motive power from horses to electricity.

Westport, Conn.—The street railway company has applied to the board of selectmen for permission to use electricity as a motive power instead of horses.

La Crosse, Wis.—Engineer Cole has been instructed to make plans for and estimate the cost of an electric light plant for street and other public lighting.

South Orange, N. J.—The South Orange and Maplewood Railroad Company has applied for a franchise to operate a trolley road on South Orange avenue.

Lockport, N. Y.—Work on the street railroad here is being pushed as rapidly as circumstances will permit. Several carloads of rails and ties have arrived.

Santa Ana, Cal.—The board of trustees have appointed W. B. Herey and W. F. Lutz a committee to draw up plans and specifications for an electric light plant.

Aberdeen, S. D.—Mr. Zeitlow, manager of the electric light plant in this city, has gone to Willmar, Minn., to prepare plans and specifications for the erection of a similar plant at that point.

New York.—It is reported that the New York and Northern Railroad will introduce electricity as the motive power on the road between Yonkers and the Harlem terminus.

Knoxville, Tenn.—The board of public works and lighting committee of the city council have rejected all bids which had been made for lighting the city and will advertise for new bids.

New Brunswick, N. J.—The projectors of the new trolley system in Middlesex County have secured a site at Milltown for their power house. They have already begun work.

Lexington, Mo.—The city council has granted a franchise to J. Wolfe & Co., of Kansas City, Mo., for an electric light plant. A special election will be held June 18 to ratify the franchise.

Moorhead, Minn.—The new electric light plant now being erected by this city will be capable of furnishing fifty arc lights and 2,000 incandescent lights. The system selected is the Westinghouse.

Waukesha, Wis.—Rights of way for the proposed electric railway line between Milwaukee and Waukesha are being rapidly secured, and members of the company state that the line will be completed within ninety days.

St. Louis, Mo.—The Florissant Avenue Electric Railway Company have accepted the provisions of the ordinance granting them the right to build and operate an electric railway on the avenue named.

Wilmington, Del.—Engineer W. B. Carswell has laid out a proposed route for the Wilmington and Brandywine Springs Electric Railway Company. Mr. Carswell's plans will be submitted to the company.

Oshkosh, Wis.—The Central Wisconsin Company has begun laying tracks for its street railway in this city. Mr. Tillotson says the work will be pushed without cessation until the entire mileage is laid and equipped.

Kasson, Minn.—There is a scheme on foot to unite the villages of Kasson and Mantorville by an electric street railway and to light both places by electricity. Water power is available for a generating plant.

Alton, Ill.—The directors and stockholders of the Middletown and Upper Alton motor line and those of the Alton and Upper Alton Horse Railway and Carrying Company have decided in joint meeting to equip their lines with electric cars.

Wrightsville, Pa.—E. H. Leffler, of Millersburg, Pa., has been granted a franchise for an electric light plant in this place. His company has applied for a charter under the name of the Wrightsville Electric Light, Heat and Power Company.

Indianapolis, Ind.—The *Journal* says: "The use of electric motors for power to run and control elevators is creating a great demand for motors of twelve to fifteen horse-power capacity, and is furnishing a good many orders for local manufacturers of electrical apparatus."

Brooklyn, N. Y.—The directors of the Kings, Queens and Suffolk company, organized to build the new electric railroad on Long Island, after hearing the report of the treasurer showing a favorable state of the company's finances, have decided to proceed at once with the work.

Georgetown, D. C.—The Falls Church and Potomac Railroad Company, lately organized, proposes to build an electric railroad from Falls Church to Georgetown. The stockholders are to hold a meeting at Falls Church early in June to talk over the plans for the road.

Newburgh, N. Y.—Surveyors have been making preliminary surveys in the towns of Newburgh, Marlboro and Lloyd for the purpose of establishing a trolley route to connect the Walden extension of the Newburgh and Walden Electric Railroad with the Poughkeepsie Bridge.

Rochester, N. Y.—Bernard O'Reilly is about to build a six-story block for manufacturing purposes on Otsego street, which will be leased to the Rich-Sager Company, manufacturers of bicycle saddles. The power for the whole building will be furnished by electric motors, and all machinery will be of the latest pattern.

Jacksonville, Fla.—It is reported that the Jacksonville and Tampa Bay Railway Company, recently incorporated, with $2,000,000 capital, by C. C. Thompson, Martin Dodge and T. S. Appleyard, has applied for a franchise for fifty miles of electric road to Tampa via Palatka, Sanford and Kissimmee.

Dearborn, Mich.—The township board has granted a franchise to Thomas D. Kearney, representing Eastern capitalists, to run an electric road to the western limits of the village from Ann Arbor. If the road is built, Detroit men will get the right of way to Dearborn and connect with the Ann Arbor road.

Middletown, Conn.—It is stated that the projectors of the Hollow Pond race track and pleasure grounds are making preparations to light the premises with an independent electric plant, and that not only will they manufacture sufficient electricity for their own uses, but they will be enabled to furnish lights to anyone else in that section who may want them.

Reading, Pa.—The Penn Electric Light, Heat and Power Company, recently organized, will erect a large plant in the northern section of this city. They will, if granted permission, place conduits underground in the different streets for their wires, and as soon as their system is completed will bid for the contract to furnish the city with light and heat.

Chattanooga, Tenn.—The survey on the Rossville electric road, which it is proposed will be built from Rossville to Chickamauga-Chattanooga National Military Park, has been actively commenced, and in a few days the franchise will be let finally. D. M. Steward, one of the principal stockholders, says the road is a sure go.

Montgomery, Ala.—The entire $30,000 capital stock of the Phœnix City and Girard Railway Company has been subscribed, ten per cent. paid in and work will begin at once. The officers of the company, elected a few days ago, are: J. F. Flournoy, president, Columbus, Ga.; J. Wainwright, vice-president, Baltimore; W. S. Drake, treasurer, Boston; Cliff. B. Grimes, secretary, Columbus, Ga.; J. H. Henderson, superintendent.

Lexington, Ky.—Sealed bids will be received until June 19 for lighting the streets on an all-night schedule with gas or electricity or both, on a five or ten years' contract, on and after Oct. 1. All bids must specify the kind, quality and candle-power of the light offered. The successful bidder must execute a good and sufficient bond in the sum of $5,000 with a guarantee company as security for the faithful performance of the contract.

Albany, N. Y.—The General Term has sustained the ruling of the Railroad Commissioners refusing permission for the building of the proposed Amsterdam, Johnstown and Gloversville Railroad. The commissioners refused to grant such authority on the ground that the proposed road would parallel the Fonda, Johnstown and Gloversville line, and that no idea of public necessity or convenience required the building of another road.

Syracuse, N. Y.—The Syracuse and Oneida Lake Electric Railway Company has filed articles of incorporation. Its principal office will be in Syracuse. The incorporators are Hiram McGonegal, of New York; William O'Connor, J. B. Morgan, William B. Kirk, William F. Wheaton, Edwin Lodder, George H. Wright, A. H. Pierce, Walter A. Wales, T. W. Meacham, J. P. West, Charles A. Fowler, John Witter, Thomas Harvey and James McCormack, of Syracuse.

Columbus, O.—Managers of electric light plants throughout the State have formed an organization for the purpose of mutual conference and protection against unjust legislative measures, etc. The officers elected are; President, A. W. Field, Columbus; vice-president, W. C. Hedges, Mansfield; secretary-treasurer, Samuel Coville, Cleveland; executive board, G. S. Long, Troy; L. C. Newson, P. P. Holmes, Youngstown; H. K. Wood, Piqua.

Little Falls, N. Y.—It is authoritatively stated that work on the Little Falls and Herkimer electric railroad will shortly be commenced. The right of way for the entire distance has been secured with the exception of the entrance into this city. No difficulty will be experienced in getting this. The road will traverse the various streets of Little Falls and Herkimer and the south bank of the Mohawk, taking in Jacksonburg and Fort Herkimer.

Mount Holly, N. J.—The Mt. Holly branch of the Pennsylvania Railway system, which has been transformed into an electric railway, is almost ready for a test of the new motive power. The power for the line will be generated at the Mt. Holly end, where a generating plant has been erected. There a 250 horse-power Westinghouse direct-connected engine and dynamo of the latest improved design has been placed in position and is expected to furnish ample power for the present needs of the road.

Marysville, Cal.—The work of constructing the Marysville and Auburn Electric Railway has begun. The road will be built from Marysville eastward through the foothills of Yuba and Madera counties and southeast to Auburn. It will cover nearly fifty miles of track. The purpose is to afford the orchardists and farmers in the foothills easier facilities for getting their produce to market and at lower cost. Passengers will be carried as well as freight. The electric power for the road will be furnished by the South Yuba Water Company.

New Orleans.—Frank Howard, one of the directors in the New Orleans Traction Company, who has just returned from a Northern trip, says he paid "special attention to the street railways in New York, Philadelphia and Washington, and he saw at once that the cars in this city were superior in size, workmanship and in everything to those of the cities mentioned. The tracks also are much better here."—The trolley mail car system is to be introduced here as soon as arrangements can be made.

Baltimore, Md.—The Baxter Electric Motor Company's Works in this city were sold at auction a few days ago, and bought in by Jesse N. Hilles, secretary of the company, for $25,000.

The Baxter Company has been in liquidation for some years, and the sale was by order of court. The works of the company are valued at $100.000 and upward. It is understood that the business of the company will be continued.—The Bayview Electric Light and Power Company of Baltimore County has consolidated with the Chesapeake Water Company under the name of the Chesapeake Electric and Water Company.

Buffalo, N. Y.—Alonzo C. Mather, of Chicago has a plan to construct a power bridge across the Niagara River here which is to be used to sustain 200-foot turbine wheels to be driven by the current, the power to be utilized in generating electricity for manufacturing and other purposes. The bridge, if the bill authorizing it becomes a law, will be constructed under a positive guarantee from Mr. Mather, with proper bond, that it will próve no obstruction to navigation. It will have a draw 200 feet or more in length, and, besides affording a means of almost unlimited power, will have footpaths, carriage-ways, and tracks for trolley cars.—The consolidation of the Buffalo and Niagara Falls Electric Railway with the Buffalo and Tonawanda Electric Railway, forming the Buffalo and Niagara Electric Railway, has been consummated. The directors of the consolidated company are: W. Caryl Ely, Charles B. Gaskell and Burt Van Horn, Jr., of Niagara Falls; Robert L. Fryer, Henry J. Pierce, George H. Dunbar and John J. McWilliams, of Buffalo; Frank A. Dudley, of Niagara Falls, and Willard P. Whitlock, of Elizabeth N. J. The consolidated capital is $1,250,000.

Telephone and Telegraph.

The city council of Columbus, O., has granted a franchise to the Columbus Telephone Company.

The Bradley telephone system, with headquarters at Forman, N. D., has been extended to Lisbon, twenty-five miles north of Forman. The line will be extended to Tower City before the end of the season.

The Central Union Telegraph Company will reduce its rates at Shelbyville, Ind., to $12 a year for business places and $8 for residences. The cut is made to meet the rates of the new company, which has placed a $10,000 plant in operation.

The Pierre, S. D., Telephone Company has begun to put up a plant for Pierre, East Pierre and Fort Pierre. Other towns will be connected in the future.

Neighborhood telephones are becoming popular in Indiana. A line has been put between Dr. I. N. Neeley's and White Cloud, in Spencer township, another from Moberly to Sharp's Mills and a line is to be built from White Cloud to Wyandotte Cave.

The following have been elected directors of the Missouri Pan-Electric Telephone Company at St. Louis: Charles H. Peck, Dr. K. Morgner, J. Clifford Richardson, Samuel M. Kennard, Ephraim Catlin, F. W. Mott, James Black, Thomas Rankin, Jr., Luther H. Conn, Wallace Delafield, J. W. Avery, F. S. Ramsdell and E. A. B. Garesche.

A convention of Railway Telegraph Superintendents is to be held at Montreal on the 12th inst. Between 75 and 100 prominent telegraph men from all parts of the United States and Canada are expected.

John F. Sherman, Fred Wardenburgh, A. Hansbach and others, all of Trinidad, Col., have organized the Citizens' Telephone Company to operate in Las Animas County and other counties. Capital stock, $15,000.

A telephone company has been organized at New Auburn, Minn., for putting in a telephone system between that place and Glencoe. The company will be known as the New Auburn and Glencoe Telephone Company. The officers are as follows: President, Wm. Reimers; vice-president, John Supple; secretary, Jacob Koons; treasurer, A. Streich.

The Louisville, Ky., general council (lower board) has passed an ordinance granting the American Long Distance Telephone and Telegraph Company the right to erect, operate and maintain its lines within the limits of the city of Louisville. In the upper board of the general council the ordinance was referred to the streets and revision committee.

At Ottumwa, Iowa, preliminary steps have been taken to organize a new telephone company to construct toll lines through the State of Iowa. Some of those interested in the enterprise are: Neil Wilkin and John Walsh, of the Burlington Improvement Company, operating the new Burlington and Oskaloosa telephone exchanges; John C. Delkolty, of the Albia exchange, and the members of the new Ottumwa telephone exchange.

R. P. Green, superintendent of the gas works at Columbus, O., and Charles F. Kline, known as the penitentiary electrician, have filed the necessary papers to secure letters patent for Kline's new telephone invention. The main claim will be for having discovered a substitute for the carbon now used. The system they have adopted enables them to run either a long or short distance circuit.

At a meeting held at Clarksville, N. Y., for the purpose of organizing a company to erect a telephone line between that place and Jerusalem (N. Y.) the following officers were elected: President, Cornelius Slingerland; vice president, R. C. Bagley; secretary, Charles Hummer; treasurer, S. J. Wright; manager, C. L. Shear; directors, M. F. Barber, J. M. Wright, A. Houck, Elmer Shear, H. Wideman, Andrew Joslin, Casper Mead and George Rothaupt.

The trustees of Cohocton, N. Y., have granted permission to the American Telephone Company to erect poles and wires in the village. The line is being built from Corning to Avon. An office will be established in each village through which the line passes.

At Ishpeming, Mich., the Marquette County Telephone Company has let contracts for the immediate construction of a telephone system to compete with the Bell system operated by the Michigan Telegraph and Telephone Construction Company.

The Illinois Central road has caused the novel telephone line between Williams and Webster City, Ia., to be discontinued, the local supposition being that the line interfered with the business of the Western Union, which operated the telegraph line along this road. The telephone was put up as an experiment and proved a success. The wire on the fence along the railroad was used as a conductor, connections being made underground at road crossings.

The board of street commissioners of Saratoga, N. Y., has granted a telephone franchise to local applicants. A new system will be introduced and the customers will own their instruments. The new line is in opposition to the Hudson River Telephone Company.

The Framingham Telephone Company, organized under Massachusetts laws and capitalized at $150,000, has applied to the Framingham selectmen for the right to introduce a line of telephone service and have a concession for sixty-five years. Behind the project are A. W. Worthley, H. H. Hunt, George H. Conant, Moses S. Case, all of Boston, and M. E. Maher of Framingham. These gentlemen propose to introduce a system with modern improvements, of which they have control, and make war upon the New England Telephone and Telegraph Company, their maximum monthly rate for houses to be $2, and for stores and places of business $2.50, against the New England's rates of $3.50 and $4.25 for similar service.

The Watertown branch of the Fitchburg Railroad is shortly to be equipped for about three miles of its length with the new electric device for the automatic control of railroad trains, so that when there is a misplaced or open switch, or a broken rail, or even another train to make danger ahead, the electric current will at once act as brakeman, and traveling through the rails and wires of the track set the air brakes on the approaching train and bring it to a stop. The system does away with block signals of all kinds.

The Phœnix Telephone Company hopes to be able soon to make an arrangement with the board of works of Indianapolis, Ind., by which it can begin work in that city. The managers claim to have over 2,000 subscribers.

The Forked Deer Telephone Company has lately been formed at Alamo, Tenn. The company proposes to construct a telephone line from some point on the Newport News and Mississippi Valley Railroad in Dyer County, by the way of Alamo, Crockett County, to Bells, on the Louisville and Nashville Railroad. Branch lines from Alamo to other points in Crockett County are contemplated, and will doubtless be constructed. W. H. Biggs, of Alamo, has been elected president of the company.

Mr. W. H. Mackay.

In securing the services of Mr. W. H. Mackay as manager of its New York office, the Columbia Incandescent Lamp Company has added to its force of sales agents one of the most experienced and best known members of the hustling fraternity. When electric lighting was in its swaddling clothes, back in 1879, Mr. Mackay began his career as assistant to Frank Ridlon, who was representative of the Brush Company in Boston, and was prominently identified with the construction of the early Brush plants throughout New England. In the construction department of the Schuyler Electric Co., Edison Electric Light Co., United Edison Manufacturing Co., Edison General Electric Co., and General Electric Co., Mr. Mackay acquired experience and acquaintance among central station managers of the United States, Canada and Spanish American countries that will be highly useful to him in his new position. His four years' management of the Roanoke Light and Power Co., Roanoke, Va., familiarized him with the wants and needs of a central station man, from the latter's point of view, which he will not fail to turn to valuable account of both lamp users and the Columbia Company.

MR. W. H. MACKAY.

Improved Service.

Patrons of the West Shore Railroad will be very much pleased at the great improvements made in the train service of that line in connection with their new time-table that went into effect Sunday, May 19.

It will be noted that the local service is greatly improved, trains making much faster time, and the suburban residents having more frequent trains on which to go to and fro. The express service to Albany and Buffalo, as well as its connections, has been made much faster.

The New York and Chicago Limited Express, formerly leaving at 5 o'clock in the evening, now leaves New York at 6 and will arrive in Chicago nearly two hours earlier than heretofore.

Another new departure is the running of a special train for the accommodation of the Boston sleepers in connection with this fast train, and in order to save time the baggage and passenger cars will run through via N. Y. C. and St. Louis Railway (Nickel Plate) from New York without change. The return East-bound train from Chicago has been made equally as fast as the West-bound train.

It will be seen that the management of this popular road are ever anxious to serve the interests of their patrons.

COMMERCIAL PARAGRAPHS.

The Newton Rubber Works, Newton Upper Falls, Mass., is distributing a handsomely designed and printed hanger illustrating their well-known electrical products.

"Steel Plate Chimneys" is the title of an interesting pamphlet recently put in circulation by the Philadelphia Engineering Works, Ltd., of Philadelphia.

The Central Electric Company says that although the frost seems to have caught the young grapevines and pingree potatoes and the Hessian flies have chased wheat almost out of the pit, up to the present there are no flies on the Lundell Fan Motor, Hessian or otherwise, and while the atmosphere in the neighborhood of a Lundell is always more or less frosty it does not reach an uncomfortable degree. Inquiries are pouring in just the same and prospects for a brilliant Fan Motor season are very promising. They also report a steadily increasing demand for Interior Conduit and kindred supplies. Architects and owners are rapidly learning the value and expediency of the perfect work made possible with Interior Conduit. A recent large order covered several thousand feet for an Illinois post office.

Written in Red.

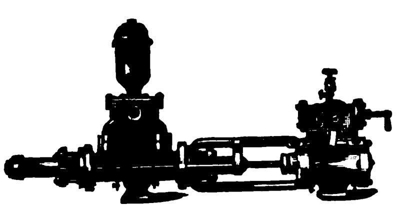
The Columbia Incandescent Lamp Company, St. Louis, is distributing a handsome work of the printer in the shape of a catalogue devoted to an illustrated description of the standard and special lamps made by this company. The cuts are full sized and represent the coiled filament, regular high and low voltage, anchored filament railway, double carbon railway, special decorative, candelabra and candle lamps, as well as the different bases now in general use.

The cover of the book is handsomely lithographed and embossed in gold. The text is printed in red.

The Yough Steam Pumps.

In a steam pumping engine of any type the valve motion is a very important part. In the Yough Steam Pump the designers have sought extreme simplicity, believing that there is no simpler valve than the old and well-known plain slide valve, covering two steam ports and one exhaust port. In this pump the valve consists of a slide valve and a piston valve, with oscillating valve at side of steam chest, having direct connection with main piston rod by a crosshead attachment. By this simple device all complication of rocker shafts, plug valves or their equivalents is done away with. The simplicity of this construction is apparent when comparison is made with the more complicated forms of pumps, the steam chest of which contains from two to four distinct valves and from thirteen to eighteen steam passages and ports, many of them so small that they are liable to become closed by gumming oil.

The accompanying illustration shows a Special Boiler Feed Pump of the Yough type, with double plungers, adapted for cold and hot water. As in all different sizes and patterns, the steam cylinder is fitted with self-acting steam packing rings, no bolts or nuts being used. The water cylinder is fitted for square piston packing which can be replaced in a few minutes. The water chests that contain valves and seats are separate castings from the water cylinder. The water chests and valves are very simple, easily examined, repaired or replaced. In large pumps the piston rod is made in two pieces, connected by a crosshead and keys, thus permitting either steam or water piston rods to be taken out without disconnecting both ends of the engine.



In addition to the boiler feed pattern described above the Yough pump is made in all sizes and for any pumping purpose, including tank, heavy and light pressure, mining, fire and deep well pumps. These pumps are manufactured by Boyts, Porter & Co., Connellsville, Pa. The manufacturers have supplied the Yough pumps for a variety of purposes—to electric plants, to the mine operators and mill and factory owners of Pennsylvania, the far West and the South and foreign countries. The testimonials received from users of the pumps indicate that all the claims of the makers are fully met.

The Walker Manufacturing Company.

Among the recent orders taken by the Walker Manufacturing Company for their Improved Street Railway Motors and Generators may be mentioned the following:

The Detroit Railway Company, Detroit, Mich., one 750 K. W. direct connected generator; this being the second machine of this size which the Detroit Railway have ordered from the Walker Company.

Aurora Street Railway Company, Aurora, Ill., nine complete car equipments, eighteen 25 H. P. steel motors. This order was awarded this company after a thorough test had been made of three or four of the leading makes of motors, and is the second order awarded the Walker Company by the Aurora Company.

Akron Street Railroad Company, Akron, Ohio, two 200 K. W. direct coupled generators, three complete car equipments, six 30 H. P. steel motors. This is the third order which has been received from the Akron Street Railroad Company.

New York, Elmsford and White Plains Railroad Company, White Plains, N. Y., one 75 K. W. belted generator, three complete car equipments, six 25 H. P. steel motors.

Lakeside Railway Company, Mahonoy City, Pa., two complete car equipments, four 50 H. P. steel motors.

W. C. Thayer, Cleveland, Ohio, two 200 K. W. direct coupled generators; ten complete car equipments, twenty 50 H. P. steel motors; one complete car equipment, two 100 H. P. steel motors.

Ashland and Catlettsburg Street Railway Company, Ashland, Ky., two complete car equipments, two 30 H. P. steel motors.

The Walker Company's shops are still running both day and night and their force is being increased almost every day.

BUSINESS HINTS.

Public Buildings, Theaters, Residences, &c., Proposed or in Course of Construction.

[The following summary is prepared weekly for ELECTRICITY for the information of advertisers and readers who are dealers in apparatus and articles required in the electrical equipment of public and private buildings.]

Atlanta, Ga.—Masonic Temple, North Pryor st. and Alden ave. W. A. Hemphill president, W. F. Parkhurst secretary.

Barton, Vt.—First-class hotel, site of American House. Mr. Stone of St. Johnsbury owner.

Bedford, Westchester Co., N. Y.—Reformatory for Women.

Boston, Mass.—Private residence, Beacon st. and Commonwealth ave., for George Morgan, son-in-law of George Willcomb.—An unknown Boston woman has signified her intention of giving $250,000 for the erection of a new Emergency Hospital.

Braddock, Pa.—The Westinghouse Electric and Manufacturing Company has begun the erection of a building for its general office at East Pittsburg. It will be a large three-story brick building, to cost about $20,000.

Brattleboro, Vt.—Town hall.

Brooklyn, N. Y.—Residence for Frederick Pratt of the Pratt Institute, lighted by electricity, Architects Babb, Cook & Willard, 55 Broadway, New York.—Building for the Brooklyn Guild Association, 245 Concord st., money donated by Henry W. Maxwell.

Buffalo, N. Y.—Apartment house, corner Allen and Mariner sts. Frederick B. Robbins sold the ground to a syndicate.

Champaign, Ill.—A new public library, to be known as Burnham's Athenæum. Plans prepared by Julius A. Schweinfurth of Boston.

Chester, Pa.—A. F. Brooks, of Cramp's shipyard, Philadelphia, will build a handsome residence here this summer.

Detroit, Mich.—Brick car-house on Warren ave., by the Detroit Railroad Company, to be lighted by electricity.

Denton, Tex.—New court house; $100,000 issued for the purpose.

Greenwich, Conn.—Commodore E. C. Benedict will build a house on the site of the American Club House, to cost $1,000,000.

Hoboken, N. J.—The Hoboken Land and Improvement Company, owners, will spend several thousand dollars on improvements in the Hoboken Theater. Architect G. M. Pollard, Manager George Hartz.

Jacksonville, Fla.—The Atlantic and New River Home Co. have selected plans for a hotel which they propose to erect.

Kingston, N. Y.—Architect A. F. Mason has prepared plans for the enlargement of the Ethings clothing store; lighted by electricity.

Lawrence, Mass—A hall for the Turn Verein Society. Architect James E. Allen.

Manchester, N. H.—Austin & Stone are treating with owners of a building on Elm st., adjoining the Weston block, with the view of converting it into a theater.

McKeesport, Pa.—The foundation of the Odd Fellows Home on Market st. has just been commenced.

Middletown, Conn.—A new armory for the Mansfield Guards is projected.

Milwaukee, Wis.—Architect Anderson has commenced work on the plans for the proposed Masonic Hall.—George Brunber has purchased a site for his new block. The structure will be eight stories, to contain stores, offices, etc.

Minersville, Pa.—A building for the Minersville Bank. Contractor Daniel McGurl of Pottsville.

New Brunswick, N. J.—Brick building, at Neilson and Church sts., to contain club rooms, assembly rooms, stores, etc. Owner, Wm Miller. Contractors Wm. Taylor and Peter Hendricks.

New London, Conn.—Ronald Massett, of New London, and John B. Lathrop, of Montville, will erect an apartment house cor. Pearl and Union sts.

New York City.—Architect George B. Post, 33 East 17th st., is drawing plans for a $250,000 building for Meyer Jonasson & Co., cloak manufacturers, in the neighborhood of Union Square....The Union Club committee's report on the proposed new club house will recommend the erection and fitting up of a building equal to any now existing at a probable cost of $1,000,000. The club at its annual meeting will vote on the question of purchasing the St. Luke's Hospital property, cor. Fifth ave. and 54th st. The address of the president, Clarence A. Seward, is 31 Nassau st....The board of governors of the New York Athletic Club have been discussing plans for the proposed new building, to cost $850,000. James Whately president, J. Gulick seretary....Architect T. Jackson, 61 Broadway, has completed plans for a bank building to be erected at 115 Chambers st. and College Place, for the Irving Institution....Flats, Apartments and Tenements: 3 five-story apartment houses at 61-65 86th st., Architect George F. Pelham, 1481 Broadway; 4 five-story flats on south side of 64th st., west of Central Park West, Architect John C. Burne, 201 East 86th st.; 3 five story tenements on south side of 105th st., east of 5th ave., owner Isaac C. Ogden, of Orange, N. J.; Theodore Cordier will erect 4 five story tenements cor. 119th st. and Madison ave.; Builders Schriner & Fennell, 6 five story stores and tenements, at Madison ave. and 113th st.; C. D. Cohen, owner and architect, 3 five story flats on west side of Madison ave. north of 116 st.; John L. Miller, Riverside Drive and 85th st., will erect 2 five story brick flats 66th st., east of Columbus ave.; Abraham Davis, 127 East 112th st., five story and basement brick flat at 127 East 112th st.; Wm. Hayes, 135 East 122d st., a five story brick tenement at 135 East 122d st.; Bernard Hananagh, 469 West 147th st., a five story brick flat on Amsterdam ave., southeast corner of 147th st.; Peter Eagan, 249 East 116th st., a five story brick flat, 111 East 117th st.; Annie C. Doyle, 421 West 148th st., a seven story brick flat, St. Nicholas ave. south west cor. of 150th st.; John J. Farley, 140 West 137th st., a five story brick flat, 7th ave. southwest cor. of 118th st.; Louis Essler, 482 West 51st st., 2 five story brick flats at 535-537 West 130th st.; four story brick store and tenement on Third ave. north of 164th st., Architect Michael J. Garvin; Architect Charles Stegmeyer, 306 East 82d st., has prepared plans for 8 five story brick flats to be erected on 98th st., west of Columbus ave.; five story brick flat on 135th st. east of Willis ave., owner George F. Picken; five story brick flat on 135th st. east of St. Nicholas ave., Architect Wm. J. Fryer, 137 Broadway; 4 five story brick flats at 46th st. east of 2d ave., Architect Solomon D. Cohen; five story brick flat at 160 Mott st., Architect George F. Pelham, 1481 Broadway; 2 five story brick flats on Water st., No. 678, Architect George F. Pelham; five story brick flat on 143d st. east of 8th ave., Architect Geo. F. Pelham, 1481 Broadway; three story brick store and tenement on Forest ave. south of 156th st., Architect A. F. Schmitt; five story brick store and flat at 56 Monroe st., Architects Horenburger & Straub; a six story brick flat, 170 Henry st., Architects Schneider & Herter; 3 four story brick stores and tenements on Forest ave., south of 156th st., Architect A. F. A. Schmitt; 2 five story brick flats on Amsterdam ave. north of 100th st. Architect George F. Pelham, 1481 Broadway; five story brick flat on West End ave., north of 101st st., Architects Thom & Wilson, 1267 Broadway; 2 four story brick flats on Elton ave. south of 158th st., Architect Herman Horenburger; 6 five story brick flats 134th st. south of 7th ave., Architects Neville & Bagge, 227 West 125th st.; a five story brick store and flat, 56 Monroe st., Architects Horenburger & Straub; Architect H. H. Carter is preparing plans for 5 flat buildings, to be erected at southeast cor. of 3d ave. and 74th st. for the Jackson estate; three similar houses will adjoin on the ave., and another will front on 74th st., it will be five stories, brick and stone; L. Z. Bach has engaged H. H. Carter to make plans for 7 five story brick and stone tenements on northeast cor. of 57th st. and 1st ave; 4 five story brick and stone flats from plans prepared by J. H. Valentine; 2 three story frame tenements 163d st. west of Trinity ave., Architect J. H. Valentine; 2 five stor brick and stone flats at 80th st. east of 10th ave., Architects Neville & Bagge, 227 West 125th st.; Heibner & Wolf are having plans prepared by Neville & Bagge for 3 five story brick and stone flats cor. Amsterdam ave. and 178th st.; five story brown stone front store and apartment house, east of 2d ave., south side of 19th st., Architect Herman Horenburger; four story brick tenement on 3d ave. north of 164th st., Architect Michael J. Garvin; 4 five story brick flats on 147th st. west of Brooke ave., Architect J. H. Valentine; five story brick flat on 90th st. east of Amsterdam ave., Architects Neville & Bagge; five story brick flat on Melrose ave. cor. 137th st., Architect J. A. Leiver; 2 five story brick flats on Monroe st. east of Market, Architect Joseph Wolff, 55 Liberty st.; Albert Wagner will erect four story brick store and apartment house at 47-51 59th st; O. Oppenheimer will build 3 five story apartment houses on south side of 84th st. west of Columbus ave.; 2 five story brick tenements are to be built at 241-243 Monroe st. by B. Wolff; four story tenement on north side of 135th st., east of St. Anne's ave., Architect Herman Horenburger, 682 East 159th st.; the same architect has plans in progress for a five story brick and brown stone front tenement to accommodate 16 families, to be erected by Michael Wolbach, northwest cor. of 158th st. and Elton ave.; Builders Jung & Mohr have had plans prepared by Charles Stegmeyer, 306 East 82d st, for 8 five story flats, north side of 98th st. west of 9th ave.; Architect Herman Horenburger is preparing plans for a five story brown stone front dwelling to be built on north side of 192d st. west of St. Anne's ave.; John H. Picken, 54 West 118th st. will erect three story brick dwellings on 120th st. west of Manhattan ave., Architect John Hauser; Mr. Picken will also erect a five story brick flat on 135th st. east of Willis ave.; Joseph L. O'Brien, 347 Grand st., will erect 3 five story brick flats, 151st st. south of Boulevard; Robert L. Gray, 235 Lenox ave., 4 five story brick flats on Amsterdam ave. north of 167th st.; Andrew Brose, a five story brick flat 101st st. west of West End ave.; A. F. A. Schmitt, 606 Cortlandt ave., a four story brick flat on Willow ave. cor. 133d st.; Mary E. Jenkins, 55 Lenox ave., two brick flats on St. Nicholas ave. cor. 113th st.; Adolph S. Kalisher, 1186 Lexington ave., a three story brick flat on Monroe st. cor. Market; Jared W. Bell, 248 Lexington ave., 2 five story brick flats on 109th st. east of Amsterdam ave.; Margaret L. King, 322 West 14th st., a five story brick flat at 544 West 51st st.

New London, Conn.—The contract for the erection of a public building has been let to C. W. Green & Co., of Chicago.

North Adams, Mass.—Fred C. Dowlin has purchased the Sibley property on Main st., and will erect on it a five story business block with opera house in the rear, at a cost of $150,000.

Orange, N. J.—Architect Charles N. Horr, of New York City, has the plans for a colonial cottage to be built at Orange for James W. Stover.

Parkersburg, W. Va.—J. W. McKinney will erect a building at 4th and Market sts., to contain hall, etc., Architect W. H. Patten.

Paterson, N. J.—John Habben has had plans prepared for transforming his residence on Broadway into an apartment house.

Philadelphia, Pa.—Hamilton & Giesenger, the silversmiths, have purchased the property at 1208 Chestnut st. and are having plans made for an eight story office building to be erected....Architect Hutton has prepared plans for addition to be built to the Aldine Hotel; the new building will be ten stories....Charles J. Mills will erect a brown stone dwelling at northeast cor. of Broad and Dauphin sts., after plans prepared by Harold Goodwin. A. J. Wood will make alterations to his house at 1425 Poplar st., including introduction of electric work and hot water heating.....A six story addition will be made to the Baker Building for offices and studio....J. W. Hallahan will rebuild the properties at cor. Chestnut and 17th sts., the new structure to contain stores and bachelor apartments.

Pittsburg, Pa.—Architect Joseph L. Neal is preparing plans for a large hotel to be built out of the city....Application for a charter for a new hospital to be known as the Eye and Ear Hospital of Pittsburg has been made; Wallace H. Rowe, Robert B. Petty, M. Atcheson and others are interested.

Pittston, Pa.—A resolution has been introduced in council for the erection of a city hall.

Rock Island, Ill.—Plans for a new county court house have been filed.

Rome, N Y.—Dr. J. M. Showerman has under consideration the erection of a sanitarium.

Roxbury, Mass.—The Board of Aldermen have referred to the finance committee an order providing $30,000 for the erection of a new city hall.

Russell, Mass.—A site on Main st. has been selected for the proposed town hall.

Somerville, Mass.—Plans, specifications and the cost for erecting a new city hall are wanted. Councilman Stevens will give information.

Seneca Falls, N. Y.—A summer hotel is to be erected at Cayuga Lake Park.

Syracuse, N. Y.—S. Rosenbloom & Sons are having plans prepared by New York architects for a new block seven stories high....L. C. Smith will erect a residence on the Stolp property to cost $100,000.

Tarrytown, N. Y.—John D. Rockefeller will build a fine residence on the hills back of Tarrytown.

Toronto, Can.—Robert Simpson will build a five story store to cost $200,000. Architects Burke & Horwood.

Utica, N. Y.—Northrop & Latchen propose erecting a twelve story apartment house to contain 140 suites of apartments, 30 bachelors' apartments, library, reception hall, gymnasium and cafe.

Washington, D. C.—Proposals will be received at the Office of Public Buildings and Grounds, War Department, for materials for a building to be erected on the site of the Government Printing Office and adjoining ground... H. D. Nichols will erect an eight story apartment house on B street.

Watertown, N. Y.—The Odd Fellows are talking of building a temple to cost about $100,000.

Willard, N. Y.—B. F. Peck of Seneca Falls has the contract for a State Hospital at this place.

Wilkes-Barre, Pa.—Contractor R. T. Long is building new fire-proof business block for Lawrence Myers.

Worcester, Mass. A fire-proof block is to be erected cor. of Mechanic and Norwich sts. by Manager F. B. Hunt of the local telephone company.....Wm. R. Dean will erect 8 six story apartment houses near his residence, 28 Piedmont st. Architects Fuller & Delano.

INCORPORATIONS.

The Brockton and Northeastern Street Railway Company, Brockton, Mass.— o build and operate an electric railway. Capital stock, $50,000. Incorporators: John P. Morse, Judge Warren A. Reed, Horace B. Rogers, of Brockton; G. H. Campbell, of Lawrence, and Edwin S. Webster and Alfred A. Glasier, of Boston.

The Milwaukee and Waukesha Railway Company—to construct and operate an electric railway system in and between Milwaukee and Waukesha, Wis. Capital stock, $1,000,000. Incorporators: Max Rosenthal, James Petley, A. B. Myers, Stutley J. Henderson, Charles Pittlekow, Jacob Wellhauer, Joel W. Bingham and L. D. Rosenheimer, of Milwaukee, and John J. Constantine, Andrew Snyder and Ernst Merton, of Waukesha.

The Springer Electric Company of McCordsville, Hancock County, Ind.—to manufacture electrical apparatus and operate telephone exchanges. The directors are T. L. Springer, S. Morrison and A. C. Morrison.

The West End Electric Light and Power Company, West Hazleton, Pa.—to supply light, heat and power. Capital stock, $10,000. Promoters: Thos. H. Powell, Hazleton; Walter McAvoy, Wilson S. Betterly, West Hazleton, Pa.

The Tilmann Portable Electric Light and Reflector Company, New York, N. Y.—to manufacture and sell dynamos, reflectors and various mechanical devices. Capital stock, $100,000. Promoters: H A. Ockershausen, J. J. Lamler, T. A. Fay, Jno. McCarthy, New York City.

The Fort Madison Water Company, Portland, Maine—to manufacture gas and electricity, machinery and fixtures for gas and electric and water plants in the city of Fort Madison and other places. Capital stock, $250,000. Promoters: Wm. C. Eaton, Edw. D. Noyes, Geo. F. Noyes, Portland.

The Globe Telephone Company (incorporated in W. Va.), New York, N. Y.—to acquire patents, electric bells, etc.; buy, sell and lease patents, etc.; operate telephone lines, etc. Capital stock $5,000,000. Promoters: Geo. W. Williams, Portland, Ore.; Frank B. Carpenter, Chas. L. George, Edw. Bradley, New York City.

The Pugh Electric Light and Power Company, Cincinnati, Ohio—to furnish electric light and power or either, and all wiring apparatus, etc., connected with said business. Capital stock, $5,000. Promoters: A. H. Pugh, Alfred Mack, Geo. W. Pickard, Obert Spencer, Jno. Galvin.

The Missouri Gas Company, Kansas City, Mo.—to deal in gas, electric light, heat and power. Capital stock, $1,500,000. Promoters; Irwin Reu, Henry C. Reu, Chicago, Ill.; C. J. White, J. C. James, J. M. Lowe, Robert M. Snyder, Kansas City, Mo.

The Citizens' Electric Light and Street Railway Company, Anna, Ill. Capital stock, $12,000. Incorporators: Christian Nordling, Charles V. Nordling and John C. Nordling.

The La Harpe Electric Light and Power Company, La Harpe, Ill. Capital stock, $15,000. Incorporators: Joseph R. Crabill, George Coulson and O. Buelen.

The Home Electric Company, Baton Rouge, La. Capital stock, $100,090. President, S. J. Laycock; vice-president, C. J. Barrow. Directors: Dr. T. J. Buffington, T. J. Kernan, Edward Wax, Solon Farrnbacher, Joseph Gebelin, S. J. Laycock and C. J. Barrows. The new company has negotiated for the purchase of the plant of the Capital Railway and Lighting Company, and the transfer of the property will take place at once.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MAY 28, 1895.

ELECTRIC RAILROADS AND APPLIANCES.

539,786. Conduit Electric-Railway System. Ferdinand Barrell, New York, N. Y. Filed July 19, 1894.

539,798. Combined Trolley Head and Wheel. William H. Dalbey, Indianapolis, Ind. Filed Oct. 11, 1894.

539,825. Electrical Connection. Peter Rieth, Chicago, Ill. Filed Feb. 28, 1895.

539,854. Trolley-Breaker. William G. Carey and Augustus A. Ball, Jr., Schenectady, N. Y., assignors to the General Electric Company, same place. Filed Nov. 15, 1894.

539,931. Rail-Bond. Frank E. Buxton, Worcester, Mass. Filed April 15, 1895.

540,010. Conduit Electric Railway. Frank B. Widmayer, New York, N. Y., assignor of one-half to Charles E. Ball, same place. Filed Aug. 3, 1894.

540,029. Means for Connecting Motors to Car-Axles. Sidney H. Short, Cleveland, Ohio. Filed Oct. 19, 1893.

540,054. Locating Faults in Electric Railways. John C. Henry, Westfield, N. J. Filed Jan. 24, 1894.

540,060. Conduit Electric Railway. William E. M. Jackson, San Francisco, Cal. Filed Oct. 25, 1893.

540,090. Electric Passenger Register and Recorder, Joseph W. Ellis, Albany, N. Y. Filed Jan 12, 1895.

540,187. Closed-Conduit System for Electric Railways. Herluf A. F. Petersen, Milwaukee, Wis. Filed March 26, 1894.

ELECTRIC LIGHTS AND APPLIANCES.

539,838. Process of Producing Incandescing Bodies for Electric Lamps. Konrad O. E. Trobach, Pankow, Germany, assignor of one-half to Sigmund Bergmann, New York, N. Y. Filed April 18, 1894.

539,863. Controller for Electric Search-Lights. Elie F. G. H. Faure, John MacHaffie, and Sam H. Libby, Schenectady, N. Y., assignors to the General Electric Company, same place. Filed Jan. 29, 1895.

539,877. Electric-Arc Lamp. John A. Mosher, Chicago, Ill. Filed May 1, 1893.

539,959. Shade for Electric Lamps. Albert S. Marten, East Orange, N. J. Filed Feb. 11, 1895.

DYNAMO ELECTRIC MACHINERY.

539,849. Electric Motor. John B. Atwater, Chicago, Ill. Filed Sept. 24, 1894.

539,876. Stationary Transformer. Walter S. Moody, Lynn, Mass., assignor to the General Electric Company, of New York. Filed May 15, 1894.

539,881. Armature-Coil and Method of Making Same. Otto F. Persson and David P. Thomson, Schenectady, N. Y., assignors to the General Electric Company, same place. Filed Oct. 6, 1894.

539,943. Armature-Winding and Method of Making Same. William Lochhausen, Brooklyn, N. Y. Filed Feb. 10, 1888.

540,035. Brush Holder for Dynamo-Electric Machines. Elihu Thomson, Swampscott, assignor to the General Electric Company, Boston, Mass. Filed Feb. 20, 1893.

540,216. System of Electrical Distribution, Ernst G. P. Oelschlaeger, Charlottenburg, assignor to Siemens & Halske, Berlin, Germany. Filed April 6, 1895.

TELEPHONE AND TELEGRAPH APPARATUS.

539,939. Electric Cable. William D. Gharky, Philadelphia, Pa. Filed Oct. 18, 1894.

540,012. Telephone Central Station. Gaston D'Adhemar, Paris, France. Filed June 20, 1894.

540,117. Conductor-Distributing Frame. Theodore Spencer, Cambridge, assignor to the American Bell Telephone Company, Boston, Mass. Filed Jan. 24, 1895.

540,159. Metallic Base for Telegraph or Other Poles. Frank E. Garner, Cornwall, Conn. Filed Jan. 9, 1895.

540,168. Electrical Exchange. Alexander E. Keith, Frank A. Lundquist, John Erickson, and Charles J. Erickson, Chicago, Ill., assignors to the Strowger Automatic Telephone Exchange, same place. Filed Nov. 7, 1894.

BATTERIES.

539,871. Galvanic Battery. Harry T. Johnson, New York, N. Y. Filed Nov. 10, 1893.

540,076. Secondary Battery. William L. Silvey, Dayton, Ohio. Filed Jan. 21, 1895.

540,185. Secondary Battery. Clement Payen, Philadelphia, Pa. Filed Aug. 17, 1893.

MISCELLANEOUS.

539,585 Rheostat Face-Plate with Supplemental Rheostat. Frank Kraemer and Max Kruger, Chicago, Ill. Filed Sept. 19, 1894.

539,725. Cut-Out Block. Frederic A. Chapman, Philadelphia, Pa. Filed Feb. 5, 1895.

539,737. Electric Treasure-Guard. Robert A. Habersham, Portland, Oreg. Filed Jan. 3, 1895

539,804. Electromagnetic Gold-Separator. Joseph D. Gibbens and William B. Murray, Portland, Oreg. Filed Oct. 20, 1894.

539,840. Safety System for Railways. Albert L. Ware, Cambridge, Mass. Filed Oct. 15, 1894.

539,870. Annunciator. Franklin A. Jennings, Ithaca, N. Y., assignor to the Electric Bulletin Company, Chicago, Ill. Filed March 23, 1893.

539,886. Electric Meter. Elihu Thomson, Swampscott, Mass., assignor to the General Electric Company of New York. Filed Feb. 18, 1895.

539,966. Electric Bell. Charles B. Sterling, New York, N. Y., assignor to the Dewey Electric Signal Company, Jersey City, N. J. Filed March 14, 1895.

540,008. Electrical Thermometer. George C. Whipple and Henry E. Warren, Newton, Mass. Filed Dec. 5, 1894.

540,073. Electric Heater, Charles J. Reed, Philadelphia, Pa., assignor, by direct and mesne assignments, to the Reed Electric Company, same place. Filed June 5, 1894.

540,153. Apparatus for Determining Differences Between Phases of Two Electric Alternating Currents. Michael von Dolivo-Dobrowolsky, Berlin, Germany, assignor to the Allgemaine Elektricitats-Gesellschaft, same place. Filed Oct. 27, 1893.

ELECTRICITY.

Vol. VIII. NEW YORK, JUNE 12, 1895. No. 22

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER CO.
B. E. GREENE, PRES'T. L. J. MONTGOMERY, SEC'Y.

PUBLICATION OFFICE:
6 Park Place - New York

EDITORS: NELSON W. PERRY.
BURTON E. GREENE.
R. H. WILLOUGHBY.

BUSINESS MANAGER, - - JOHN L. GANS.

SUBSCRIPTION RATES:

United States, - - - - -	$2.50
In Clubs of Five or More, - - - - -	$2.00
Foreign Countries, - - - - - - -	$4.50
Single Copies, - - - - - - -	10 Cents

ADVERTISING RATES:

As Electricity reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.

Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

ENTERED AT THE N. Y. POST OFFICE AS MAIL MATTER OF THE SECOND-CLASS.

TRADE SUPPLIED BY
THE AMERICAN NEWS COMPANY,
THE WESTERN NEWS COMPANY,
And their Agencies in all Principal Cities.

EDITORIAL NOTES.

The "Engineer's" Blindness, or Ignorance, Which? Our esteemed contemporary, the *Electrical Engineer*, published in its issue for May 29 a two-column editorial, entitled "Buffalo Blindness," which for imbecility and recklessness takes the palm. That journal is consistent, however, for originally having given space to a long article by Messrs. Houston and Kennelly demonstrating (?) that power could be economically transmitted by electricity from Niagara Falls to Albany, it would not do to go back on any proposition, however absurd, that might be made by the Power Company to the city of Buffalo. Such misrepresentations as are contained in the editorial referred to are just the agencies which, acting cumulatively, have brought the electrical business into its present lamentable condition. It is a mistaken kindness to the electrical trade to boost an ill-advised project, and it is to save the electrical trade and profession from friends like the *Electrical Engineer* that Electricity has its chief cause for existence.

The *Engineer* thinks that Buffalo has been blind to its own interests in not accepting at once one of the several propositions made by the Niagara Power Company. It mentions that the Power Company offered "to sell power to the city in blocks of 10,000 H. P., delivered at *Niagara* either as 'undeveloped' power, 'developed' power, or 'electrical' power, at the *low* prices of $10, $13 and $18 per H. P. per annum respectively" (the italics are ours), and seems to think these figures are entirely reasonable. To the layman they do appear low, but to the honest engineer they mean something entirely different from what appears on their face. If the Niagara Company charge $3 per annum for developing H. P. it means *at least* as much for Buffalo, viz., $30,000 per annum for 10,000 H. P. The legal rate of interest in New York State is 6 per cent. This development, if undertaken by the city, means an investment of $500,000. Also by the last proposition—$18 per H. P.—it means a yearly output cf $80,000, or an investment of $1,333,333, with the power still undelivered. The most feasible method of transmitting this power to Buffalo—twenty miles distant—is still an open question, and how much it will cost to deliver it is not yet determined. The Niagara Company itself, in reply to a demand from Buffalo that a maximum price shall be named, says that there are so many contingencies in the practical fulfilment of the plan that it is *impossible* to name a maximum price. As we had occasion to remark once before, "If the Niagara Power Company after having studied this question all these years cannot tell what it is going to cost to deliver its power in Buffalo, who can?" And we may add here that we would consider it the height of folly for the city of Buffalo to undertake the solution of the problems of transmission and distribution, in regard to which the Power Company confess themselves too far in the dark to make even now a definite proposition.

The *Electrical Engineer* gives these figures as though they meant something definite, whereas they mean absolutely nothing. They would have the city of Buffalo grant an exclusive franchise for something which might mean a dead loss of a million and a third dollars in addition to the cost of getting the power where it could be utilized, because, with the experimenting and other operating expenses, that power when delivered would cost more than it could be generated for on the spot.

Assuming that the city of Buffalo bought the power at $18 per electrical H. P. per annum at the dynamo terminals, does the *Electrical Engineer* know how much of that power it will have to sell to its customers after deducting line losses in transmission, transformer losses and distribution losses? Does it know what the load factor will be? Does it know what the cost of administration, including interest on investment and depreciation will amount to? The Niagara Power Company with all their facilities confess that they cannot yet tell. If they can't, how can the city of Buffalo arrive at even an approximate figure when the calculations involve, in addition to the usual unknown quantities, that other one known as political management? Buffalo would be blind indeed if it allowed itself to be drawn into any such scheme. Why doesn't the *Engineer* give some figures by which the public can judge of the cost of power delivered by municipal enterprise? It does to this extent—it says: "Recent tests of the cost of steam power in Buffalo made since the publication of the printed statement of the Power Company, and by so competent an expert as Mr. Horatio A. Foster, show that no large plant in the city of Buffalo can be found using 1,000 H. P. or more where the cost of the steam power is less than $50 per H. P. per annum."

We presume that Mr. Foster's figures are entirely correct. Dr. Emery states that with coal at $2 per ton power can be produced under fairly continuous operation for 365 days of 20 hours each for $36.56 per H. P. The coal alone costs at $2 per ton $11.22. At Buffalo, it is stated, coal costs but $1.50 per ton. The cost per H. P. at this price would therefore be but $33.76. We find a discrepancy between Mr. Foster's figures and those attainable in ordinary practice under favorable conditions of $16.24 or about 32.5 per cent. To what is this discrepancy due? Undoubtedly to the load factor, and yet this very load factor is entirely ignored. It will be as great, if not greater, for the whole city of Buffalo than for the establishments cited as paying $50 per H. P. Why does the *Engineer* disregard this important item?

There is another important fact that is ignored, i. e., that a H P. at the terminals of the generator at Niagara is not a H. P. delivered at Buffalo, or a H. P. salable to a customer. How much will this loss in transit amount to? We are not advised.

Our contemporary then proceeds with a number of statements that seem to indicate either a most profound ignorance of the subject of which it professes to be an exponent or a wilful attempt to mislead. It says: "*It is a well-known fact that if the mechanical power were given* to the *Buffalo General Electric Company free of charge*, the local lighting company could not *at cost* furnish arc lamps at $50 *per H. P. per annum.*" Is this a well-known fact? If so the Buffalo General Electric Company would better go out of business at once—it is a disgrace to the business, its management is a monument of incapacity, and Mr. Huntley is not the competent station man that he is universally credited with being. We do not believe that this is "well known," or known at all.

As to the *practicability* of transmitting the power from Niagara to Buffalo, our contemporary says: "But those who know of the Frankfort-Lauffen transmission of 108 miles, and the more recent successful operation of the various plants in this country, such as at Telluride, Sacramento and other places where the distance exceeds 20 miles, recognize in this situation no reason for doubt of the entire success of the Niagara transmission to even greater distances."

After making such a statement as that, can the *Electrical Engineer* ever again hold its head up before the public as an exponent of electrical knowledge?

Does not our friend Martin *know* that in the Frankfort-Lauffen transmission the power cost when delivered at Frankfort *five times* as much as it could be produced for locally by means of steam? If he does know this, why does he cite this as an example of the practicability of transmission? If he does not know this, we refer him to as high an authority as Prof. William Cawthorne Unwin, F. R. S., who says on page 3 of his recent book "On the Development and Transmission of Power": "The fact must be borne in mind that the cost of the power when it reached Frankfort was five times as great as that of an equal amount of power produced directly in Frankfort by a steam engine."

The transmission at "Telluride *and other places* where the distance exceeds 20 miles" is also cited. Does not our contemporary know that there is quite a difference as regards *practicability* of transmission to a place like Buffalo, where coal costs $1.50 to $2.00 per ton, and to a place like Telluride, where it costs $15 to $20 per ton and is difficult to get at *any* price? If it doesn't, it ought not to set up as a teacher of economics. *And further*, does it not know that the distance of the Telluride transmission is but 16 *miles?*

The original Telluride transmission was but three miles. It has recently been extended to the Tom Boy mine, making a transmission of about sixteen miles. Soft lump coal costs in Telluride from $10 to $12. It costs fully $10 to transport this coal to the Tom Boy mine, making the price of coal at the point where power is delivered somewhat *over* $20 per ton. Hard coal costs about $2.50 more than the above. During many months in the year transportation to the Tom Boy mine is entirely interrupted.

The Sacramento transmission plant from the American River near Folsom is also mentioned as a successful example of the transmission of power "where the distance exceeds 20 miles." Will the editors of the *Electrical Engineer* tell us when this plant will be put into operation? If it is already in operation, it is of such recent date that it could scarcely be cited as yet as an example either of successful or unsuccessful transmission. Its status at present is so little further advanced than that of Niagara that it would be almost as appropriate to cite Niagara as a precedent for Folsom as to cite Folsom as a precedent by which to judge the practicability of Niagara.

Steam coal costs at Sacramento $8 per ton, at Buffalo $1.50 to $2.00.

Does the *Engineer* regard the commercial conditions the same here as at Buffalo? If not, why is the comparison drawn unless to mislead?

The Tivoli-Rome installation abroad is also cited by the *Electrical Engineer* as an example "where the distance exceeds 20 miles." Does not it *know* that this line is *less* than 20 miles? If not, we refer it to the numerous descriptions that have appeared both in the American and in the foreign electrical journals. If it does know that this line is but 18 miles long, why does it cite it as an example of one that "exceeds 20 miles"?

And now, since none of those mentioned by our contemporary that are in operation to-day exceeds 20 miles or even equals that distance, let us ask about "the other places where the distance exceeds 20 miles."

Can the *Electrical Engineer* name a single case in this country where current for both light and power are transmitted to a distance of 20 miles? Can it name a single instance in the whole world where such a transmission is now in successful operation and where coal costs less than $10 per ton?

We have gone into detail in regard to this part of the *Engineer's* argument, simply to show how utterly regardless of truth it can be, and how utterly worthless its statements of facts are. This is the class of journalism that is ruining the whole electrical industry, and it is the kind that must be stopped—either this or the people must stop patronizing such journals if the public is again to feel confidence in electrical investments. This is the class of journalism that rendered possible the selling of Edison electric light stock at $5,000, and which has resulted in G. E. stock selling down to less than $30. This is the class of journalism that is now trying to involve the city of Buffalo in an unwise contract merely because it is an electrical scheme, and it is this class of journalism, which if persisted in, will do as much injury to the development of future legitimate transmission of power schemes as it has heretofore done to general electrical progress.

Now as to the other features of the case.

Transmitted power can only compete with locally generated power when the former can be delivered to the customer on favorable terms as compared with the latter. If electricity can be generated cheaply at the distant point it can compete successfully with local steam power when the latter costs more than the former delivered. In the Western mining regions where coal is scarce and transportation, labor and all other supplies are expensive, it may pay to transmit power electrically to very considerable distances. Where labor is plenty and fuel is exceedingly cheap, as at Buffalo, the commercial conditions favorable to long transmissions are exactly reversed.

Why should the city of Buffalo grant a franchise to the Niagara Power Company unless the latter can assure it that it can benefit the city? It seems to us that Buffalo would be blind indeed if it fell into any such trap. It is all well enough to say that if permitted to come into Buffalo the Niagara Company will have to meet the prices of locally generated steam power or go out of the business. But why doesn't the Niagara Company *say* what it will do—name a maximum price that is fair? It declines to do so and says that it can't. It considers, according to our contemporary, that any demands of this kind on the part of Buffalo are entirely unreasonable. To the contrary, such demands are the most reasonable that could be conceived and should form the basis for all other negotiations. If the Niagara Company would name such a price as would be favorable to the city, the latter then could and doubtless would be generous in the other terms. Without such a basis to go on we do not see how negotiations can be further continued. We think that some of the other conditions talked of by the city *are* onerous. One of these is that the company shall furnish the city 4,000 H. P. at $20 per H. P. Another is that the franchise if granted should be so limited in time. But without an agreement as to maximum price the requirement of power at $20 per year for the waterworks would be $20 per year too much. Without a maximum price a term of franchise for one day would be too long; *with* a satisfactory maximum price $20 is unreasonably low and fifty years' life of franchise none too long.

But after all this babble about franchises and transmission which the *Engineer* indulges in is cleared away there is another feature of the situation which is also entirely beyond the comprehension of our contemporary—the stockjobbing part of the Niagara enterprise, which has already proceeded far enough to be conspicuous to those who give any real thought to the scheme, and which will soon be even more apparent.

With a franchise in the city of Buffalo and with sufficient misrepresentation as to what it might do in the way of selling current there, the Niagara Power Company would soon be doing a thriving business in the sale of stock. Without that franchise the scheme will be harder to work. The *Electrical Engineer*, therefore, is doubly guilty—guilty of exposing its own gross ignorance of the general subject of transmission and disgracing the technical press, and guilty of assisting the speculators, as far as is in its power, to carry through one more scheme to blacken the fame of this industry by its failure.

The city of Buffalo is not far wrong so far in the stand it has taken, and every citizen of that town should exert his influence to prevent the granting of a franchise which will be used to extract money from the pockets of investors under false pretenses—for nothing else but speculative purposes.

* * *

The Tacoma Steal. The public will be under obligations to Messrs. P. D. and J. O. Armour if they carry their protest against the swindling methods of the T.-H. Company to the extent of making it plain just how C. A. Coffin and his fellow swindlers worked the various schemes which have disgraced the entire electrical trade of the country and placed electrical securities under the ban in all conservative financial institutions. Full exposure would have ended Mr. Coffin's career before he succeeded in robbing New England investors of millions in bogus bond transactions. We shall give in early issues further information as to the T.-H. financiering scheme which will be interesting to the Messrs. Armour, to the public generally, to Messrs. Coffin and Byllesby, the Old Colony

Trust Company, the United Electric Securities Company, and which ought to interest some of the grand juries in various States.

Most of our readers would suppose that this Tacoma game has been played to its limit. Not so. Even now Mr. C. A. Coffin, O. Z. Mitchell and G. W. Bird, the latter two receivers of the property, are planning for another reorganization and another bonding. The new blood this time is to be the absorption of the Point Defiance Railway, lately purchased by Mr. Mitchell.

Under the Searchlight.

Views and Opinions on Timely Topics.

READING NOTICE EDITORIALS.

Elsewhere we discuss an editorial in the *Electrical Engineer* of May 29 on Niagara transmission. Other editorials in the same issue were one on the "Cold Snap," which may be passed without comment, and one on "Street Car Speeds" which shows the depths to which a once dignified journal may descend in abject puffery. A daily paper paragraph is copied, relating how a bicycle rider fell in front of a 125th street cable car and was saved from death because the car was stopped in time. Then the *Engineer* says: "Now, it is well known that these cable cars are equipped with the Gennett air brake and not the later, better form of it either."

Nothing of the kind is *well known*. It was not known in the office of our contemporary until it was supplied with the clipping and the request for editorial mention by the Gennett Air Brake Company. The editorial had no purpose except to puff this special brake, which is no better than a half-dozen others.

Advertisers in the *Electrical Engineer* should understand the situation clearly, and to be sure they have what they are entitled to should stipulate in their contracts that they are to have so many columns of editorial space free during the year.

Readers seeking honest opinions and expert views of what is going on should also understand that the editorials in that sheet are supplied by advertisers and are just as valuable as the matter in a trade circular—and no more so.

MORE TROUBLE AT CLEVELAND.

(From the Cleveland Leader.)

The General Electric Company has met with a snag in its wholesale absorption of electrical concerns.

David L. Einstein, of New York, has begun proceedings to compel the officers of the Swan Lamp Manufacturing Company to produce the books, contracts, records, etc., for an examination by experts.

Einstein says that there are 380 shares of stock which was issued by the Swan Company at $100 each outstanding. He owns fifty of them, and the General Electric Company the remainder. The Swan Lamp Manufacturing Company holds, he continues, in his petition, a judgment against the Brush-Swan Company of New England, but the General Electric Company, by controlling both the Brush Electric Company and the Swan Lamp Manufacturing Company, effected as a result of a series of suits between the Brush Electric Company and the Brush-Swan Company, a settlement whereby the Swan Lamp Manufacturing Company received nothing more substantial of its judgment against the Brush-Swan Company than a fictitious judgment.

He claims that the judgment was so manipulated by the General Electric Company that the company in which he owns fifty shares of stock was left out in the cold. Einstein says that President Hamill informed him that the Swan Lamp Manufacturing Company earned more than $20,000 in 1893, and between $12,000 and $15,000 in 1894. He further claims that the Swan Incandescent Light Company obtained a judgment of $5,000 against the Swan Lamp Manufacturing Company, but that in order to secure itself against the payment of the judgment, the General Electric Company executed a fictitious chattel mortgage in favor of itself and against the Swan Lamp Manufacturing Company for $55,000.

There is no way, Einstein concludes, in which the condition of the business affairs of the Swan Lamp Manufacturing Company can be ascertained other than by the examination of the books by experts.

"Digest of Current Technical Electrical Literature."

(From ELECTRICITY, May 29.)

If the *Electrical World* is fair, and if its Digest is what it claims to be, the readers of that paper will see a report of this case (the underrunning trolley litigation) in the Digest a *week after this*, credited to ELECTRICITY. Will it be fair? We'll see.

(From ELECTRICITY, June 5.)

We expect this week to see mention of our report of the underrunning trolley litigation in the Digest, if the latter is what it claims to be and its editor is fair. But won't it be rather galling to the *Electrical World* to credit us with important news that it missed? It will be a great strain on the editor's fairness and—will he be fair? We'll see.

(From the Electrical World Digest, June 8.)

"EL'TY", May 29, publishes at some length the records of the final hearing of the litigation between the General Electric and the Westinghouse Companies, the main points of which were given in the *Electrical World* two years ago."

Here are the "*main points*" given by the *Electrical World* two years ago:

(From the Electrical World, May 6, 1893.)

GENERAL ELECTRIC COMPANY'S TROLLEY PATENTS.

After several years of contention and interference before the Patent Office, two broad fundamental patents have been granted to Chas. J. Van Depoele, covering, it is claimed, all the essential features of the trolley. The patents are assigned to the Thomson-Houston Electric Company; the applications were filed Aug. 12, 1887, and June 18, 1888, and both patents granted April 11, 1893, the patent numbers being 495,443 and 495,383 respectively.

In detail, the claims allowed cover, first, the underneath contact made either by a rolling wheel or sliding spoon contact pieces (sic); secondly, the converse of these two cases; and thirdly, the reversibility of the trolley pole on top of the car, enabling the contact to be made on either side of the trolley, as the case may be.

The possession of this patent practically means, it is claimed by the interested parties, the entire control of the overhead system throughout the United States. The acknowledgment of the claims under this patent granted to the dead inventor made by the Patent Office is claimed as an important victory by the General Electric Company and may develop another *cause celebre* in patent litigation.

It seems that the *Electrical World's* foresight is better than its hindsight (an unusual thing), for it saw two years ago that the awarding of these patents was likely to develop another *cause celebre*, but now that that *cause celebre* has developed it can't see it at all. Here is another evidence of the decadence of the *World*. It had energy enough two years ago to print something although what it did print was wrong. It now hasn't energy enough to print anything—not even to correct the mistakes of two years ago. It stated that the two applications referred to were filed Aug. 12, 1887, and June 18, 1888, whereas in fact the first one was signed and sworn to on Jan. 17, 1887, and filed in the Patent Office March 12, 1887.

What a great and enterprising sheet the *Electrical World* is in these days! What would it do with its dead if it weren't for its Digest?

* * *

ACCORDING to Henry Villard's plan for reorganizing the Milwaukee street railways, there are to be $7,000,000 5 per cent. mortgage bonds, $8,500,000 guaranteed 5 per cent. stock and $3,500,000 common stock. Of the bonds $1,500,000 is to be used for betterments and the remainder to be distributed pro rata to present holders of bonds.

WHAT DOES IT MEAN?

This is Too Much Land for an Instrument Factory.

(From the Newark Sunday Call.)

The Weston Electric Instrument Company, of which Prof. Edward Weston is the presiding genius, has found its quarters too contracted in the building at the corner of William and Shipman streets, and has arranged for an extensive plant at Waverly. The company has purchased about forty-eight acres of land on both sides of Frelinghuysen avenue for the purpose, the last purchase of a little more than twenty-three acres being concluded last week with William R. Ward, executor of the Meeker estate, which lies on the west side of Frelinghuysen avenue north of the road to the gates of the Fair Ground, and runs back into the cove. This will be opened up in building plots for employees of the works, and the property will be rented or sold upon easy payments to the employees of the company. About 100 cottages will be built upon this tract by the company.

The actual work of building can hardly be started until early in September, as the plans are not yet made. The buildings upon the factory tract will all be constructed of steel and brick, with a view to making them as fire-proof as possible. A spur will be run into the yard from the Pennsylvania Railroad when the plant is completed, and the company will thus have every facility for getting stock and fuel and for shipping its products. At the same time it will have the advantage of the proximity of the Lehigh Valley road on the west and the trolley line on Frelinghuysen avenue.

Quite True.

(From Chambers's Journal.)

The promised applications of ELECTRICITY are almost innumerable.

* * *

This Was Not a Gas Engine Man.

The *Railway Review* prints the following: "I had occasion recently, says J. Allen in *Dixie*, to call upon a manufacturer in regard to the securing of some information relative to a certain machine that he is making. It was a gratification and somewhat of a surprise to find that he seemed more than willing to enter into all of the details of his wrinkles and arrangements and show everything that he had about the premises.

It was an experience so different from that which one is so apt to meet with that I was more than gratified and perhaps looked it. At any rate, in the course of conversation, the proprietor remarked that it was his habit to throw everything that he had open to everybody, competitors included, and court the widest publicity; he said that he lived in an atmosphere of patents, every new device that he produced was patented, and he regarded this as far better security than secrecy. Even when experimenting with a new device before the patents were applied for, he makes no concealment of what is going on, so that, in case of an interference, he will have ample proof of priority if he really is entitled to it, and if he is not entitled to it he says that he does not want it. It is one of the best practical exemplifications of what I have always advocated : that there are only two ways of preserving inviolate the rights in new ideas; one is to maintain an absolute secrecy, which is an absolute impossibility if any goods are sold, and the other is in courting such publicity that everyone shall know that the goods are yours and no one will dare to infringe. It is, however, a hard doctrine to inculcate, for the old idea of burying the head in the sand and fancying that no one sees has a strong hold and is not easily eradicated."

The Periodic Law of the Chemical Elements.

As the law of periodicity of the elements has been specially noticeable of late in connection with argon, it may be of interest to mention three new points of discovery in 1894 by which the probability of this law has become strengthened. The points are referred to in an article on "Progress in Physical Chemistry During 1894," by J. W. Rodgers, in *Science Progress* for the current month. (1) Töpler has found that the volume-change observed when a metal melts is a periodic function of the atomic weight; (2) Bailey has discovered that in an *even* series of elements the temperature of decomposition of an oxide is higher the higher the atomic weight, in *odd* series the reverse rule holds; and (3) Deeley observed that if the density of an oxide is divided by the atomic weight of the contained metal the quotient is a periodic function of the atomic weight. It is interesting to observe the steadiness with which the pile of evidence in support of one of nature's most beautiful laws grows higher and higher every year.

The Electrostatic Capacity of Coils.

A suggestive little paper was recently communicated by J. Cauro to the Paris Academy of Science on the subject of the electrostatic capacity of coils. As is well known, coils that are double wound may be regarded as possessing a capacity which increases rapidly with the resistance, but as having a self-induction which is small enough to be negligible. In the ordinary method of estimating self-induction, the algebraic sum of the self-induction and the capacity is ascertained, and since capacity is equivalent to a negative self-induction, the result of such a measurement may be either positive or negative. If positive the algebraic sum may be made equal to zero by the introduction of a sufficient amount of paraffin so as to increase its capacity; if negative the self-induction may be increased by the introduction of a suitable soft iron core. The capacity may be considerable, and must be eliminated whenever the elimination of self-induction is considered necessary. Cauro relates that in his attempts to reduce the combined effect of self-induction and capacity in resistance coils, he has obtained excellent results by starting the winding of alternate layers of wire from the same end of the bobbin. For further details the original paper may be consulted, *q. v.*, *Comptes Rendus*, CXX (1895), p. 308.

THOMSON-HOUSTON FINANCIERING METHODS.

THE G. E. COMPANY, C. A. COFFIN AND PAUL SCHULZE CHARGED WITH GROSS FRAUD.

P. D. and J. O. Armour Seek to Establish Their Rights as Stockholders.

THE TACOMA ENTERPRISE AND ITS MORAL.

The following has appeared in slightly varying form in the daily press throughout the country:

Tacoma, Wash.—In attempting to foreclose the $1,350,000 mortgage against the Tacoma Railway and Motor Company the New York Guaranty and Indemnity Company has encountered the Armours of Chicago—P. D., jr., and J. O.—who have set out to compel a compromise or to show up the alleged street railway wrecking methods of the General Electric Company.

The Armours became interested in the local street railway company several years ago when it had $750,000 in capital stock. On this Paul Schulze, the president, issued $1,500,000 in bonds and disposed of $1,350,000 through the New York Guaranty and Indemnity Company. The Armours are innocent stockholders, and claim that the bond issue was excessive and unwarranted. In placing these bonds, it is alleged, Schulze made use of a dummy syndicate. Another feature of the deal was the purchasing of a suburban railway for $350,000 when it was valued at only $60,000, besides turning over to the seller a bonus of $141,000. All this, the Armour stockholders assert, was done in collusion and with a view to permitting the General Electric Company to wreck the local street railways.

It is evident that the Armours have not got a clear understanding of the situation, and with a view to assisting them and the public generally to properly appreciate the Coffinesque system of financiering electrical properties, ELECTRICITY will explain the case more fully, as the Tacoma deal was only typical of dozens of others. The primary object of the T.-H. people was not to wreck a railroad, but to GET BONDS and sell them—no matter what kind of bonds.

Turning to our card index of General Electric information, we find under the letter T a large mass of data in regard to this Tacoma enterprise some of which is embodied herein.

The Tacoma Railway and Motor Company was incorporated in 1889, and was partially equipped with Sprague apparatus. The town had in 1890 36,000 inhabitants. In 1892 the railway had issued $750,000 each of stock and bonds.

The Thomson-Houston Company had a road in the same town, the Tacoma and Steilacoom Electric Road. In line with Mr. Coffin's policy of consolidation and more bonds, these two properties were brought together almost immediately upon the formation of the G. E. Company, which was on June 1, 1892.

It was in connection with this deal that the Armours claim they were swindled, and we guess they were.

The chief swindle, however, was perpetrated upon the small investors of New England who bought series 7, 8 and 9 of the bonds of the United Securities Company, each of which had for a part of its basis $200,000 of the bonds of the Tacoma Railway and Motor Company.

The T.-H. road from the outskirts of Tacoma to the fishing hamlet of Steilacoom never had any legitimate reason for being built. It was a T.-H. deal from the start, local capitalists not being willing to touch it. It was built beyond question for just the purpose it was subsequently used for—a plain swindle. Steilacoom had a population of 500; it was eleven miles from Tacoma, with no intervening towns of any size. No sane and *honest* man would have put one dollar into it, yet by Coffinesque management it yielded a good profit to the T.-H. Company and no doubt a large rake-off to Mr. Coffin and his associate, Paul Schulze, who has since been driven by his many crimes to commit suicide.

When the consolidation deal was first talked of the Tacoma Railway and Motor Company was not in good condition. It was already over-capitalized and was not able to pay its debts. The Steilacoom road was also in bad shape. The purchase of the latter by the former offered no possible chance for improving the condition of either property. The only hope it offered was for a bond swindle, which was the sole stock in trade of Mr. C. A. Coffin. No other plan of financiering was ever known to him. Accordingly he arranged matters through Mr. H. M. Byllesby, then in charge of the Northwest G.-E. Company, and Paul Schulze.

It was not deemed wise in the beginning for

1.—TACOMA RAILWAY AND MOTOR COMPANY—JUNE 1, 1892.

Surplus, June 1, 1892		82,020.71	18,773.74
			$1,255,170.07

the T.-H. people to appear openly, so it was represented by Mr. Schulze to his people at Tacoma that he was trading with an Eastern syndicate who would take over a new and increased issue of bonds. The proposed purchase of the Steilacoom road was kept a secret between Coffin, Byllesby and Schulze. The bonds were issued and $1,250,000 of them were sold, $250,000 remaining in the treasury to provide for future "betterments." The "syndicate" took $910,000 at 80. These bonds with later additions to the G.-E. holdings are now held as follows:

G. E. Company	$800,000
United Electric Securities Company (Series 7)	200,000
" " " " " 8)	200,000
" " " " " 9)	200,000
Street Railway and Ill. Properties	200,000

The purchase price of the Steilacoom road was then fixed at $350,000, with a bonus to the seller of $141,060. The property was worthless as a matter of fact, though the Armours admit it might have been worth $60,000. As a part of the bargain the T.-H. people agreed to newly equip their system, though this clause in the contract, it is claimed, was subsequently cancelled by Schulze and Byllesby in collusion. Schulze also turned over to the Northwest Company $100,000 in bonds for new apparatus which was never delivered.

The Armours claim that in the deal with the T.-H. Company with the $910,000 of bonds sold at 80 went a bonus of $910,000 of stock; also that in pursuance of Schulze's agreement with Byllesby a fictitious stock issue of $141,000 was made and for this stock and $1,250,000 of bonds the company received in money and property only the sum of $800,000. The debt created, it is alleged, exceeded the indebtedness permitted by the company's by-laws by $800,000 or over, and it is declared the whole transaction is a fraud against the State constitution and laws. All this, it is alleged, was done collusively with the Thomson-Houston Company by hoodwinking the motor company's stockholders, the entire frauds aggregating $746,000.

We present herewith a statement of assets and liabilities taken from the records of the Tacoma Railway and Motor Co., showing clearly the situation of that company on June 1, 1892; it was already hopelessly entangled—over-capitalized and in debt. It was in no shape to justify the purchase of any additional property. These facts were ignored by Coffin, Byllesby and Schulze, who saw in the situation an opportunity for the application of their favorite plan, and although the enterprise had been unable to pay interest on borrowed money, freight charges, even wages, it was rehabilitated, saddled with $750,000 more debts, and the securities floated in the Boston market.

This statement was the one on which the bonds were floated through the New York Guaranty and Indemnity Co. Its padding is too evident to admit of dispute. The franchise account of $125,000 had no value unless the company could make money. The item of $250,000 in stock of the Tacoma Street Railway Company should have been wiped out—that road was now a part of the Tacoma Railway and Motor Company, and all it had of value was already in the franchise or construction and equipment account. This financial statement, however, speaks so clearly of bankruptcy that it needs no analysis. We also present from the original, signed "G. W. Bird, Auditor," the statement of earnings and operating expenses for the quarter ending October 31, 1892—the first three months of the consolidation. This table is eminently worthy of analysis by those who want to know just what kind of property Mr. Coffin thought would stand a total capitalization of $2,500,000.

The statement is a decidedly unfavorable one on its face; but we are advised that the gross

BOND AGREEMENT—(FAC-SIMILE).

This Indenture, Made this first day of July, A. D. 1892, by and between the TACOMA RAILWAY AND MOTOR COMPANY, a corporation duly organized under the laws of the State of Washington, and having its principal office in the City of Tacoma, in the County of Pierce and State aforesaid, (said company being hereinafter called the Railway Company,) party of the first part, and the NEW YORK GUARANTY AND INDEMNITY COMPANY, a corporation duly established under the laws of the State of New York, and having its principal place of business in the City of New York, in the last named State, (said company being hereinafter called the Trustee,) party of the second part, WITNESSETH, that

WHEREAS, at an adjourned annual meeting of the stockholders of the Railway Company, duly called, and held on the twenty-seventh day of June, 1892, the following vote was duly adopted:—

WHEREAS, The Tacoma Railway and Motor Company is largely indebted for extensions and additions made to its property, said indebtedness having been contracted for purposes necessary for the transaction of its business; and

WHEREAS, It is desirable to retire the present issue of bonds secured by a first mortgage covering the property of said company; and

WHEREAS, It is desirable to provide for future additions and extensions to said property, and pursuant to the lawful purposes of its incorporation;

NOW, THEREFORE, BE IT RESOLVED, That the Trustees of this Company be, and they are hereby authorized to make and issue, in the name of this Company and by its proper officers, first mortgage coupon bonds for one thousand dollars ($1,000) each, to the amount of one million five hundred thousand dollars ($1,500,000), payable thirty years from their date (subject, however, to call at $1040 each and accrued interest, at or after five years from their date and before maturity,) with interest at the rate of six per cent per annum, payable semi-annually, said bonds to be of such form as the Trustees may deem best. Twelve hundred and fifty of said bonds, of the par value of one million two hundred and fifty thousand dollars ($1,250,000) are to be certified and delivered by the Trustee forthwith, upon the order of the President and Treasurer of the Tacoma Railway and Motor Company, and the President of the Northwest General Electric Company of St. Paul. Two hundred and fifty of said bonds, of the par value of two hundred and fifty thousand dollars ($250,000), to be issued only for future additions and extensions to the property of this Company, real or personal, or for paving, and under such terms and conditions as said Trustees may make. And to secure the payment of the principal and interest of said bonds the Trustees are hereby authorized to execute and deliver to the New York Guaranty and Indemnity Company, as Trustee for the bondholders, in the name and behalf of this Company and by its proper officers, a mortgage or deed of trust constituting a first lien on all the property, assets and franchises of the Company, both present and future acquired, and said deed of trust shall contain such terms and conditions as may be agreed upon by the Trustees and said Trustee for the bondholders, including a provision for the retiring of a certain number of bonds before maturity.

AND WHEREAS, The Trustees of the Railway Company did thereafter, on the twenty-seventh day of June, 1892, at a meeting duly called and notified, a quorum being present and participating, examine and approve this Indenture in the terms in which the same is now written, and did by vote, under the power conferred upon them by said resolution of the stockholders of the Company, as well as by virtue of every other power enabling the Trustees so to do, authorize and direct the execution of said Indenture by the President and Secretary of the Company, and the acknowledgment and delivery thereof by said officers, or by either of them alone, and did also examine and approve the said bonds and coupons, in substance as herein set forth, and did, by vote, authorize and direct the execution thereof and the delivery of the same to the Trustee for certification and issue;

AND WHEREAS, Said bonds, with interest coupons attached, have been executed and are now ready to be authenticated by the Trustee and issued as authorized and directed as aforesaid, said bonds being consecutively numbered from 1 to 1500 inclusive, and the coupons attached to each of said bonds bearing the number of the bond to which they are attached, and being also consecutively numbered from 1 to 60 inclusive, which bonds and coupons, and the Trustee's certificate endorsed upon said bonds, are substantially in the following form, to-wit:

UNITED STATES OF AMERICA.

No........ FIRST MORTGAGE 6/100 BOND $1000.

OF THE

TACOMA RAILWAY AND MOTOR COMPANY,

OF TACOMA, WASHINGTON.

ORGANIZED UNDER THE LAWS OF THE STATE OF WASHINGTON.

Sinking Fund. TOTAL AUTHORIZED ISSUE, $1,500,000. Gold Bond.

For value received, the Tacoma Railway and Motor Company promises to pay to the New York Guaranty and Indemnity Company, Trustee hereinafter mentioned, or to the bearer hereof, or, in case of registration, to the registered holder, the sum of one thousand dollars, in gold coin of the United States, equal in weight and fineness to the present standard, at the office of said New York Guaranty and Indemnity Company, in the City of New York, N. Y., in thirty years from the date hereof, to-wit, on the first day of July, A. D. 1922, (or on call at or at any time after the expiration of five years from date as hereinafter provided,) with interest thereon at the rate of six per cent per annum, payable semi-annually in like gold coin on the first days of January and July in each year, at the office of said New York Guaranty and Indemnity Company in said New York, according to the tenor of the coupons hereto attached, upon the presentation and surrender of said coupons respectively.

This bond is one of a series of one thousand five hundred bonds for one thousand dollars each, amounting in the aggregate to one million five hundred thousand dollars, numbered consecutively from 1 to 1500, both inclusive, all bearing even date herewith, and being of the same tenor and for the same term of thirty years, executed and delivered in pursuance of a vote of the stockholders and a vote of the Board of Trustees of said Tacoma Railway and Motor Company, authorizing the issue of said bonds and the execution and delivery of the mortgage hereinafter mentioned.

Payment of this bond and of the coupons attached is secured in the manner and upon the terms therein stated, by a first mortgage upon all the property, assets and franchises (both present and future acquired) of said Tacoma Railway and Motor Company, bearing even date herewith, executed and delivered by it in pursuance of said votes of the stockholders and of the Board of Trustees, to said New York Guaranty and Indemnity Company, as Trustee for the bondholders, which mortgage has been duly filed and recorded both as a chattel mortgage and real estate mortgage, in the office of the County Auditor of the County of Pierce in the State of Washington. Said mortgage is hereby referred to, and the terms thereof made a part of this bond.

This bond may, at the option of the obligor, be redeemed at or after the expiration of five years from the date hereof, and before maturity, by payment of one thousand and forty dollars ($1040), together with all interest accrued to the time of such payment and unpaid, due notice of the call therefor having first been given by publication as required by the terms of said mortgage.

This bond may be registered at the option of the holder, on the books of the said Railway and Motor Company, kept at the office of the Trustee, such registration to be noted thereon. If registered, it shall pass only by transfer on the books of the Company, noted also on this bond; but it may be discharged from registration by being so transferred to bearer, after which it shall pass by delivery until again registered. The coupons shall in all cases be negotiable by delivery whether the bond itself be registered or not.

This bond shall not be valid until the certificate indorsed hereon shall have been signed by the Trustee.

IN TESTIMONY WHEREOF, Said Tacoma Railway and Motor Company has caused its corporate seal to be hereto affixed, and these presents to be signed in its name and behalf by its President, and attested by its Secretary, and the coupons attached to be authenticated by a fac-simile of the signature of its Treasurer, this first day of July, A. D. 1892.

TACOMA RAILWAY AND MOTOR COMPANY,

[SEAL.] ....*President.*

Attest:

..................................*Secretary.*

$30. COUPON. $30.

The Tacoma Railway and Motor Company promises to pay to bearer thirty dollars at the New York Guaranty and Indemnity Company, in the City of New York, N.Y., January 1st, 1893, being six months' interest then due on bond No. 000, dated July 1st, 1892, in United States gold coin, equal in weight and fineness to the standard at the date thereof, unless said bond shall be previously redeemed as provided therein.

..................................*Treasurer.*

[NOTE.—The provision "unless said bond shall be previously redeemed as provided therein" is not contained in the first ten coupons.]

TRUSTEE'S CERTIFICATE.

The undersigned Trustee, named in the within bond and in the mortgage therein referred to, certifies that this bond is one of the series of fifteen hundred bonds specified in said mortgage as thereby secured.

NEW YORK GUARANTY AND INDEMNITY COMPANY,
Trustee.

earnings were padded to an astonishing degree, and that honest bookkeeping would have shown a loss every month. However that may be, the figures as they stand show that the property was in no condition to warrant any financiering scheme except the confession of bankruptcy and reorganization on different lines. The net earnings claimed for the best four months in the year were barely sufficient to pay the interest on the bonds without setting anything aside for depreciation. For the other eight months the showing must have been much worse, and if the Armours go deep enough into the facts they will probably learn that the whole system never earned one dollar of honest profits to apply upon interest, and that the accounts were manipulated to present an entirely false showing. Interest on the bonds was $90,000 per annum, and net earnings claimed were, on the basis of the best four months in the year, just about the same.

The entire history of this Tacoma Railway after the Edison and T.-H. companies appeared as factors is one of dishonor and disgrace. It is deemed worthy of all the space we give up to it this week because it is typical of those very methods which have brought the electrical industry and electrical securities into deserved disrepute, against which ELECTRICITY has directed its attack, and to abolish which we shall continue to wage relentless warfare.

This history embodies the two main features of the evil policy of the parent companies—the sale of worthless apparatus and the swindling financiering schemes.

The horse railroads of Tacoma were capitalized at $250,000 When the Edison General Company, through Mr. O. Z. Mitchell, had equipped it electrically it was capitalized at $1,500.000. It

NOW, THEREFORE, THIS INSTRUMENT WITNESSETH, That the said Railway Company, in consideration of the premises, and of one dollar to it in hand paid by the Trustee, the receipt whereof is hereby acknowledged, and in order to secure the payment of the principal and interest of the bonds aforesaid, and every part thereof, as the same shall be and become payable according to the tenor of said bonds and of the coupons thereto attached, has granted, bargained, sold, conveyed, transferred, assigned and mortgaged, and by these presents does grant, bargain, sell, convey, transfer, assign and mortgage unto the said party of the second part, as Trustee, and its successor or successors in the trust, all the property of said Railway Company, real, personal and mixed, and also and including all tenements and hereditaments acquired or appropriated, or which may be hereafter acquired or appropriated for the purpose of the rights of way of the lines of railway of said Railway Company, or any of them, and all the easements, appendages and appurtenances thereunto belonging or in anywise appertaining, and all the railways, ways and rights of way, buildings, tracks, viaducts, culverts, stations, water tanks, turn tables, fences, and other superstructures, erections and fixtures, whether now held and owned or hereafter acquired and owned by the Railway Company; and also all machinery, locomotive engines, stationary engines, boilers, steam motors, dynamo electric machines, generators, electric motors and other electrical apparatus and appliances, rolling stock, cars, poles, lines, wires, tools, horses, cables, fastenings, rails, ties, switches, supplies and material of every description, and all other property, personal and mixed, of whatever description and wherever situated, together with all and singular the privileges and appurtenances thereto belonging, and whether now held or hereafter acquired by it; all things in action, contracts, claims and demands of the said Railway Company, whether now owned or hereafter acquired, as well in law as in equity, together with all the rents, issues, profits, income, privileges and franchises growing out of or appertaining to said property; and with full power on the part of the Trustee (so far as it lawfully may) to succeed to and enjoy all the rights, privileges, immunities and franchises, corporate or otherwise, of said Railway Company, also all the right, title and interest of the said Railway Company by deed, lease or otherwise, in and to the following described real estate:

All those certain lots, pieces or parcels of land, situate in the City of Tacoma, in the County of Pierce, and in the State of Washington, and bounded and particularly described as follows, to-wit:

Commencing at a point where the northerly line of South Thirteenth street terminates, seven and fifty-four hundredths (7.54) feet easterly from the northeasterly corner of South Thirteenth and "A" streets, which said point is also the southeasterly corner of Block No. twelve hundred and one (1201) according to the plat of New Tacoma, recorded the third day of February, 1875; thence from said point north eighty-one degrees thirty-two minutes east eighty-one and seventy-five hundredths (81.75) feet to within one hundred and four and nine-tenths (104.9) feet of the westerly line of the Northern Pacific Railway Company's right of way; thence south three degrees twenty-six minutes west two hundred eighty-seven and five-tenths (287.5) feet; thence south eighty-one degrees thirty-two minutes west twenty-nine and ninety-five hundredths (29.95) feet to the easterly line of "A" street; thence north eight degrees twenty-eight minutes west along said easterly line of "A" street two hundred forty-six and eighty-one hundredths (246.81) feet; thence north three degrees twenty-five minutes eighteen seconds east (along the easterly boundary line of South Thirteenth street) thirty-six and sixty-two hundredths (36.62) feet, to place of beginning.

Also all of lots one (1), two (2), three (3), four (4) and five (5) in Block one (1) of Ridgedale Addition to the City of Tacoma, said Ridgedale Addition to the City of Tacoma being situated in Section one (1) Township twenty (20) north of Range two (2) east of the Willamette Meridian (reference being had herein to the recorded and established map or plat of said Ridgedale Addition).

Also the right, title and interest of said Railway Company, by deed, lease or otherwise, in any other real estate in the City of Tacoma or elsewhere, which said Railway Company may own (now or hereafter) or have an interest in.

Together with all and singular the tenements, hereditaments and appurtenances thereunto belonging or in anywise appertaining, and the reversion and reversions, remainder and remainders, and rents issued and profits thereof.

TO HAVE AND TO HOLD the above described property, rights, franchises and privileges unto the said party of the second part, Trustee as aforesaid, its successor and successors in said trust, and their assigns; IN TRUST HOWEVER, under the terms hereof, for the equal pro rata benefit and security of the person or persons, firm or firms, and corporation or corporations which shall become and be the lawful owners of the said bonds and coupons, without any preference of one bond over another by reason of priority of issue or of any act or thing whatsoever. For the further carrying into effect of this conveyance, the Railway Company hereby appoints the Trustee and its successors in the trust, the attorneys of the Railway Company, in its name and behalf to ask, demand and receive for the Railway Company payment and delivery of any and all sums of money, notes, chattels and effects assigned and transferred to the Trustee by this Indenture, or intended so to be, and to give effectual releases and discharges in the name of the Railway Company to the party or parties making such payment or delivery; and for any or all of the purposes aforesaid or of this instrument, the Trustee may appoint an attorney or attorneys, agent or agents, may from time to time revoke such appointment, may use the name of the Railway Company, and generally act in relation to the premises as it or they shall think best.

ARTICLE 1. Provided, however, that until default shall be made in the payment of the principal or interest of said bonds to be issued hereunder, or some of them, or in the performance by the Railway Company of any of the covenants of the said bonds or coupons or of this Indenture, the Railway Company shall possess, operate, maintain, and enjoy all the franchises, rights and property of every kind conveyed by this Deed of Trust, and every part thereof, with the appurtenances, and take and use the tolls, income, rents, issues and profits thereof, in the same manner and with the same effect as if this deed had not been made.

ARTICLE 2. And if the Railway Company shall well and truly pay the principal of said bonds, and every one of them, and all interest thereon, when the same shall become due and payable, according to the meaning of these presents and of said bonds and coupons, and shall well and truly perform and keep each and all other its covenants, promises and agreements herein contained, then and thereupon all the estate, right, title and interest of the said Trustee and its successor and successors in the trust hereby created, shall cease and determine; otherwise this instrument shall remain in full force and effect.

ARTICLE 3. But if any default shall be made by the Railway Company in the payment of the interest on said bonds or any of them, or any part thereof, or in the payment of the principal sum of said bonds, or any of them, or any part thereof, when the same shall become due according to the tenor of said bonds and coupons and of this Indenture, or if the Railway Company shall fail to make the yearly payments required by Article 13 of this Indenture, or any of them, or if the Railway Company shall fail faithfully to observe and perform any of the requirements made of it by said bonds and coupons or by this Indenture, and such default or failure shall continue for the space of thirty days after written notice thereof has been given by the Trustee to the Railway Company, then and thereupon it shall be lawful for, but not obligatory upon, the said Trustee to terminate and put an end to the possession of said premises by the Railway Company, and to take possession of, operate and enjoy the said property hereinbefore described, and the rents, issues and profits thereof, for the benefit of the bondholders, in which case the Trustee shall be entitled to the appointment of a Receiver, having such powers and duties and acting under such limitations as the court making the appointment shall confer and impose; and the Trustee may also, or instead of so doing, and with or without taking possession, treat the whole amount of the principal of said bonds, together with all accrued and unpaid interest, as immediately due and payable, and thereupon proceed to sell and dispose of, by one sale, or successively through several sales, all and singular the premises, property, rights, interests, franchises, bonds and stocks hereby conveyed and mortgaged, or intended so to be, or such portion thereof as the Trustee may deem necessary, at public auction in said City of Tacoma, upon such terms as to credits, partial credits and security for payment as it may think proper or expedient, having first given public notice of the time and place of the sale or sales by advertisement printed once a week for at least six successive weeks in some newspaper printed and published in said City of Tacoma, and also twice a week for the said six weeks in some daily newspaper printed and published in said City of New York; and no other notice or demand whatsoever to or upon the Railway Company, except the said thirty days' written notice prior to the commencement of foreclosure proceedings, shall be necessary. The Trustee shall have the right to adjourn such sale or sales from time to time in its discretion, giving reasonable notice of each adjournment; and, after so adjourning, to make the sale at the time and place to which the same may be adjourned. The Trustee is hereby further authorized and empowered, either in its own name or in the name of the Railway Company, to make, execute, acknowledge and deliver to the purchaser or purchasers at such sales, good and sufficient deeds of conveyance of the property so sold; and any sale made as aforesaid shall be a perpetual bar, both in law and equity, against the Railway Company, and all persons claiming by, through or under it, from claiming the property, rights, interests or franchises, so sold, or any interest therein. And for the purpose aforesaid, the Trustee, and each of its successors in the trust, are hereby constituted irrevocably the attorneys of the Railway Company. As affecting the title to any property purchased at any such sale, the facts set forth in any affidavit, made by the President or Vice-President of the Trustee and appended to the deed of conveyance, relating to the time and manner of giving such written notice, or to the time and manner of giving notice of the sale, shall not be open to contradiction or dispute by any party or parties, but the same shall conclusively be deemed to be true.

Out of the proceeds arising from such sale or sales, the Trustee shall first defray the expenses thereof (including its just and lawful charges for services and expenses, and reasonable allowance for attorney and counsel fees), and refund any advances or expenses reasonably made or incurred by it in operating, maintaining or managing the property or business of the Railway Company while in possession, and all payments made for taxes, assessments, insurance and other proper charges upon said premises and property. The balance of said proceeds shall be applied and paid as follows, viz.:

If the said balance shall not exceed the aggregate par value of all the bonds hereby secured, which may at the time be issued and outstanding, then the money shall all be applied in payment, or partial payment, as the case may be, of the principal of said bonds, the several bondholders to receive the net proceeds in proportion to the amount of bonds held by them respectively, and in the contingency herein provided for, after foreclosure, all coupons shall be wholly excluded from sharing in the distribution of said balance of proceeds. If, on the other hand, the balance of proceeds available for distribution shall exceed the aggregate par value of the bonds at the time issued and outstanding, then the money shall be applied first in payment of the principal of the bonds, and next in the payment had on January 1, 1892, thirty-seven miles of track, two of which were cable. At the then prices of apparatus, its outfit should have cost about $780,000, and with the traffic in sight it would have done fairly well on a legitimate capitalization of $800,000. But that prince of wreckers, Mr. Henry Villard, was interested, and pursued his usual policy, engineering the capitalization of $1,500,000 through his agent Schulze.

When Mr. Coffin came to the front he stepped in where Mr. Villard had quit. The king of robbers followed the prince and raised upon an already bankrupt property $750,000 more of money.

From the figures herewith submitted it is easily apparent that the property, earning capacity, or condition of the Tacoma Railway and Motor Company did not justify any increase of bonded debt. We have charged that the Steilacoom road, for the absorption of which Mr. Coffin planned the consolidation, had even less value.

No further proof of our charge is necessary than Mr. Bird's own figures in statement No. 2. This road was acquired at a total cost of $491,000 in 6 per cent. bonds. The interest on this sum would have been $29,460 annually. The total gross earnings for the first three months after the consolidation, the best months of the year, were $2,245 or at the rate of $8,980 per annum. Operating expenses or net earnings are not given on this branch, and they don't need to be.

The total gross earnings were less than one-third of the interest on the purchase price.

Enough has been said, we think, to show just what the essence of this entire deal at Tacoma was. The failure of the Tacoma Railway and Motor Company was not an accident. It was the result of a carefully planned swindle, born under the regime of Henry Villard in the Edison General Electric, and all but dead when he retired; revivified in the brain of Charles A. Coffin, given new life, and carried out by the carefully coached Byllesby with the assistance of the weak-minded Schulze.

The data here presented are simply introductory to that which we shall print in the next few months bearing upon the various financing schemes of the T.-H. coterie. It is all at hand and is now being classified.

When we have completed our work, we are confident that every honest man engaged in the industry in any capacity will doff his hat to ELECTRICITY, the only journal in America which has dared to expose the rascals and hasten their expulsion from the trade.

THE BOND AGREEMENT.

We reproduce a fac-simile of the bond agreement upon which this swindle of three-quarters of a million was carried out, merely for the consideration of those who are not familiar with such matters. It is not, however, meaningless. It shows the invariable method of Mr. Coffin when he had a dishonest scheme of this nature to carry through. The first thing for him to do was to get a reputable financial institution to lend its name to the plan; thus the ignorant were led into a false belief as to the stability of the enterprise, and into the half belief that the financial institution stood as guarantor for the fulfilment of the bond agreement. The Old Colony Trust Company had been Mr. Coffin's favorite usually, but for the Tacoma deal the New York Guaranty and Indemnity Company was used. Its very name must have given confidence to the ignorant New England laboring men and washerwomen who had a few thousand dollars to invest.

ELECTRICITY expects to live long enough to force these financial and trust companies to use a great deal more caution as to the schemes to which they lend their names. We believe it to be a safe assertion that of all the electric railway and lighting enterprises in which the Old Colony

---

pro rata of interest, as represented by the outstanding matured coupons, and (in case of distribution between two successive coupon days) by a just proportional part of the several coupons then next maturing. In making the distribution of said net proceeds on the interest account, the overdue coupons, whether still attached to the bonds or severed therefrom and owned separately, shall not be paid in the order in which they fall due respectively, but all shall be treated alike, save as amounts due thereon (to be paid in full or ratably, according to the amount of the balance of money available for the purpose) shall vary by reason of the computation of interest on said coupons from their respective maturities. If, after payment of the principal of said bonds and all interest, as aforesaid, computed to the time of making the payment, any balance of said proceeds still remain, the remainder shall be paid over to the Railway Company or its assigns.

ARTICLE 4. The foregoing provision for sale under the power aforesaid is cumulative with the ordinary remedy of foreclosure by entry or suit therefor, and the Trustee is hereby given also the right to make such foreclosure upon all of the property at one time and in one proceeding, or upon portions of it successively and in separate proceedings. And the Railway Company hereby waives any and all rights of sale and redemption now or hereafter provided by the statutes of Washington. It is further distinctly understood and agreed that upon and after the expiration of thirty days' notice in writing given by the Trustee to the Railway Company of any default by the Railway Company under this deed, the entire principal of said bonds shall, at the election of the Trustee, be deemed immediately due and payable; and the Trustee shall not be required to signify its said election in any manner other than by beginning a suit to foreclose, or by proceeding to sell the mortgaged property. It is hereby declared and agreed that any one or more of the bondholders, or any person in his or their behalf, may purchase the property at any sale of the mortgaged premises, whether made under the power of sale hereinbefore contained, or pursuant to a judicial decree; and that the receipt of the Trustee shall be a sufficient discharge to the purchaser or purchasers for his or their purchase money. And if the sale be in parcels, each purchaser shall take good title, notwithstanding that enough may have been already received to satisfy the debt hereunder. By whatever method or proceeding the mortgage may be foreclosed, the order and method of distribution of the net proceeds realized on a sale or sales of the property shall be as hereinbefore provided.

ARTICLE 5. Before proceeding to take possession of the mortgaged property, or to foreclose this deed or mortgage (whether the foreclosure be made by sale under said power or otherwise), the Trustee shall have the right first to require from the bondholders reasonable indemnity against loss and liability that may be incurred by it in so doing; and upon the tender of such reasonable indemnity by the holder or holders of a majority of the bonds at that time outstanding and unpaid, whether such indemnity shall have been previously requested of them or not, it shall be the duty of the Trustee, in case of default on the part of the Railway Company continuing for the above mentioned space of thirty days after written notice as aforesaid, and not waived as hereinafter provided, to take such action pursuant to the terms of this deed as the party or parties tendering the indemnity may in writing request. In all cases of any instructions or requests by bondholders to the Trustee hereunder, the same shall be in writing, and the Trustee shall have the right to demand proof of the ownership or legal holding of the bonds, the alleged holders or owners of which claim the right hereunder to instruct or request; or said Trustee may require deposit of the said bonds.

ARTICLE 6. No delay or omission by the Trustee in exercising the rights and powers herein granted shall be held to exhaust or impair such rights and powers, or be construed as a waiver thereof; but it is hereby mutually agreed that the holder or holders of a majority in amount of the bonds outstanding at the time of any default as aforesaid on the part of the Railway Company, may, by an instrument in writing, signed and acknowledged by them, at any time, whether before or after the institution of foreclosure proceedings, waive, or instruct the Trustee to waive, any such default; provided always, that no such action on the part of the bondholders shall extend to or be taken to affect any subsequent default, or impair the rights resulting therefrom. The Trustee agrees, on any default in the payment of interest on the said bonds, or any other default, on the written request of the holder of any of said bonds, to give written notice to the Railway Company of any such default under this Indenture as the person requesting such notice to be given shall allege to exist.

ARTICLE 7. The Trustee may act by agents or attorneys, and shall not be responsible for their acts or omissions, but shall be bound to use due care in their selection and retention. It shall be liable only for reasonable care and diligence in relation to taking possession of, operating, controlling, managing and selling the premises and property aforesaid, or otherwise carrying out the provisions of this instrument. It shall not be bound to recognize any person or party as a holder of any of said bonds, nor to take any action at his request, unless his bond or bonds are submitted for its inspection, or his ownership thereof is otherwise shown to its satisfaction; and it may, if it so desires, require the bonds so submitted to be deposited with it and retained until it shall have completed the action requested by such bondholder.

ARTICLE 8. It is further agreed that the Trustee may at any time resign the trust by resignation delivered to said Railway Company, and that, in case of such resignation, or of the removal or incapacity of the Trustee, by reason of insolvency or other cause, the Railroad Company shall have the right to nominate and appoint a successor to the said office of Trustee, with the consent in writing of the owners of a majority of the bonds hereinbefore described as secured hereby at the time outstanding and unpaid; but any vacancy of more than sixty days' standing may be filled by any court having jurisdiction, on application of the outgoing Trustee, or any person interested. No bond shall be required of any Trustee, unless ordered by court for cause shown. Upon the appointment of any successor to the trust by either method above mentioned, all the mortgaged or trust property shall immediately, and without conveyance, vest in the new Trustee; but the outgoing Trustee shall, nevertheless, at the request of any person interested, but at the expense of the Trust, execute, acknowledge and deliver to the new Trustee such deeds of conveyance or other instruments in writing as may be appropriate to vest or confirm in the new Trustee the mortgaged or trust property.

ARTICLE 9. The Railway Company agrees at all times on request to furnish the Trustee a schedule showing with reasonable detail the items of the estate, property and other things covered by the lien hereof, or intended so to be. And the Trustee shall have power from time to time to release from the lien of this deed any of the property embraced or intended to be embraced herein, and shall not be responsible in any way on account of such release if the same be made on receipt of a written certificate from some person (selected by it with due care for the purpose) to the effect that the security will not thereby, in the judgment of such person be unreasonably impaired, the attendant expense being paid by the Railway Company. The Railway Company covenants and agrees that, having possession as aforesaid, it will diligently preserve the rights and franchises now or hereafter granted or conferred upon it by the laws of said State of Washington, or by the ordinances or laws of any city, town, municipality or county wherein its road is or shall be constructed, that, using and operating its railway tracks and lines as the same are now constructed, or as the same may hereafter be constructed or extended, it will at all times maintain and preserve said tracks and lines, and every part thereof, together with the rolling stock, fixtures and appurtenances, in thorough repair, working order and condition, and fully supplied with motive power and equipments; and that it will, from time to time, make all needful and proper repairs and replacements, so that the traffic and business of the road and of every part thereof, shall at all times be carried on with safety and despatch. And until default as aforesaid, the Railway Company may sell or otherwise dispose of such rolling stock, machinery, equipments or other property, including real estate, as shall have become worn out or unsuited to the business of the Company, provided it renews the same or substitutes therefor other property of equal or greater value, or invests the proceeds in equipments or property useful in the operation of the road, the Trustee's assent to such sale, exchange or other disposition, to be expressed in writing. All the renewals, or new materials and property so acquired shall thereupon be covered by and subject to this mortgage. The Trustee shall not be responsible in any event for its action, if based on a written certificate from some person (selected by it with due care for the purpose) that the proposed sale, exchange or disposal will not diminish the security, the expense of obtaining such certificate to be paid by the Railway Company.

ARTICLE 10. The Railway Company hereby expressly covenants and agrees to pay any and all taxes, assessments and governmental charges assessed or laid upon the property hereby conveyed or intended so to be, and also to keep said premises and property at all times insured, in such sum as shall reasonably protect the insurable property, payable in case of loss to the Trustee as its interest may appear. In case of loss, the Trustee shall allow the insurance money received to be applied by the Railway Company toward the replacement of the property destroyed or injured, if the Railway Company so requests in writing, and shall, upon such request, pay such money over to the Railway Company for that purpose, on receipt of proper vouchers signed by the President and Treasurer, or Vice-President and Treasurer, of the Railway Company, to the effect that said property has been replaced by new or additional plant or property costing as much as the amount of money paid over on said vouchers; but if the Railway Company should not, within sixty days from the loss, request in writing to have the insurance money so applied, then it shall be invested by the Trustee in good securities, and form part of the trust property hereby conveyed, and shall, together with all interest and accumulations thereon, be subject to the provisions of this Indenture in like manner as the other property hereby conveyed, except that the possession thereof shall be held by said Trustee until the securities are disposed of according to this Indenture.

ARTICLE 11. The Railway Company covenants and agrees to cause this mortgage or deed of trust to be recorded and filed both as a mortgage of real estate and of personal property, in such manner and in such places as may be required by the laws of any State in which property now or hereafter embraced in this deed may be situated, so as to preserve and protect the security of the bondholders and the rights and remedies of the Trustee. The Railway Company also agrees hereafter, from time to time during the existence of this trust and mortgage, to make, execute, acknowledge and deliver all such further instruments and conveyances as, in the opinion of the legal counsel of the Trustee, may be necessary or proper to facilitate the execution of said trust, or to further secure said bonds, all of which additional instruments and conveyances the Railway Company agrees to keep properly filed and recorded.

ARTICLE 12. The Railway Company hereby expressly reserves the right to pay and redeem said bonds or any of them at the expiration of five years from the date hereof, or at any time thereafterwards and before maturity, by paying for every bond called, the amount of the principal thereof, and, in addition, four per cent (4%) premium thereon, together with all interest accrued on the same and unpaid at the time fixed for such redemption, provided notice thereof be given to the holder or holders of the called bond or bonds, printed once a week for at least four successive weeks in a daily newspaper printed and published in said City of Tacoma, and also in some daily newspaper printed and published

Trust Company has been interested as the agent of the T.-H. schemers a majority have been very much like Tacoma, Pueblo and Little Rock.

We note in this bond agreement a phrase peculiarly Coffinesque in its wording, viz., "These bonds are subject to call at $\$1{,}040\frac{00}{100}$ each, and accrued interest, at or after five years from their date and before maturity."

This was a peculiar characteristic of all Mr. Coffin's schemes—holding out to the purchaser of worthless bonds the possibility of unusual gains from the investment, sometimes more and sometimes less. The same rule was applied to all the issues of the Securities Company.

It will be seen that Messrs. Schulze and Kershaw were compelled to swear that the proceeds of these bonds were legitimately applied. Schulze killed himself in April last, but Kershaw is still living, and we hope that both he and Byllesby and Coffin, may be compelled to testify before the court what became of the money.

When we are through with this campaign the atmosphere will be clearer.

Among the entries for the Bedford two-year-old plate at the Newmarket races (England) recently was "Dynamo by Peter out of Electric Light." The reports say that "Dynamo made the whole running." That is as it should be—and by gracious how the dynamo did run!

---

in said City of New York, the first publication of notice in each case to be at least four weeks before the time fixed in said published notice for such redemption; and, at the expiration of such time, all interest on the bonds called shall cease. But all such calls for redemption shall be made through the Trustee, and the numbers of the bonds to be redeemed shall be determined by said Trustee by the casting of lots. It is further expressly understood and agreed that if, after any bond has been called for payment in accordance with the foregoing provisions, the same shall not be presented to the Trustee for redemption on or before the day fixed therefor in the published notice, the Railway Company may deposit with the Trustee to the credit of such bond, designated by the number thereof, a sum of money equal to the principal thereof, and, in addition, four per cent (4%) premium thereon, together with a sum equal to the interest accrued on the bond up to the date fixed for redemption as aforesaid and remaining unpaid, which deposit shall be full payment of the bond and coupons belonging thereto, as between the Railway Company and the holder thereof. Said deposits in the hands of the Trustee shall draw no interest. Thereupon and thereafterwards, such bond and the coupons thereto belonging shall be excluded from participation in the lien and security afforded by these presents, and the holder shall look for the payment of the bond and accrued interest only to the sums so deposited in the hands of the Trustee, and in no event to the Railway Company; but said sums so deposited shall be held by the Trustee to the credit of and for the payment of said bond, and shall be paid by the Trustee to the holder thereof upon the presentation and delivery to it of such bond, together with all the outstanding coupons thereto belonging. And upon the presentation to the Trustee, cancelled, of all said authorized issue of bonds and coupons which at the time shall have been issued and outstanding, or upon the presentation of a portion thereof canceled (all of said bonds having been duly called for payment), and the deposit by the Railway Company with the Trustee of a sum of money sufficient, together with all amounts then on deposit under Article 13, to pay at the rate aforesaid all of said bonds and interest that are not presented to the Trustee in accordance with the call therefor, the Trustee shall cancel and discharge this mortgage or deed of trust as fully and to the same effect as if the total issue of said bonds and coupons had been duly paid by the Railway Company at the maturity thereof. The bonds called and redeemed under this Article 12, together with the coupons thereto belonging, shall be forthwith canceled by the Trustee, and delivered, with the coupons attached, to the Railway Company.

ARTICLE 13. The Railway Company agrees, during each of the years specified in the following schedule (said years being understood to commence on the first day of July), to pay over to the Trustee in cash, an amount sufficient to call (including the cost of advertising) and redeem, according to the provisions of Article 12 hereof, the number of bonds of the issue hereby secured, which are set opposite said years respectively, that is to say:

During	1897 to 1901	inclusive,	redeem	10	bonds each	year, or	50	in all.
"	1902 to 1906	"	"	20	"	"	100	"
"	1907 to 1911	"	"	30	"	"	150	"
"	1912 to 1916	"	"	40	"	"	200	"
"	1917 to 1921	"	"	50	"	"	250	"
	Total,	-	-	-	-	- -	750	bonds.

The Trustee agrees, from time to time, upon receipt of the amounts deposited with it for the purpose of such redemption, forthwith to call and redeem said bonds; and all bonds so called and redeemed under this Article 13, shall, together with the coupons attached, be forthwith canceled by said Trustee and delivered to the Railway Company. The provisions of Article 12, so far as applicable, shall affect all bonds called for redemption under this Article 13.

ARTICLE 14. The Railway Company covenants that, as the coupons attached to the bonds secured hereby mature, they shall be paid by it and canceled; and it is agreed that no purchase or sale of, or loan made of or upon, said coupons, on behalf, at the request, or with the privity of the Railway Company, whether before or after maturity, and no redemption of the said coupons by any guarantor of the payment of the same, shall operate as keeping the said coupons alive or in force as a lien upon the mortgaged premises, as against the holders of the bonds secured hereby, and of the coupons annexed thereto.

ARTICLE 15. Any of the bonds issued hereunder may be registered, at the option of the holders, on the books of the Railway Company, such registration to be noted also on the bonds themselves. If registered, they shall pass only by transfer on the books of the company, noted also on the bonds. But they may be discharged from registration by being so transferred to bearer, after which they shall pass by delivery until again registered. The coupons shall in all cases be negotiable by delivery, whether the respective bonds themselves be registered or not. The Railway Company agrees that it will at all times, so long as the bonds issued hereunder or any of them remain outstanding and unpaid, cause to be kept at the office of the Trustee, in said City of New York (or other place in the City of New York, of which due notice will be given), suitable books for the registration and transfer of such bonds as may be presented for the purpose. And the Railway Company hereby constitutes and appoints the Trustee its bond registry and transfer agent, with all powers usual and proper in such cases.

ARTICLE 16. The Railway Company will also, at any and all times, upon the written request of the Trustee, furnish to the Trustee, upon blanks provided by it for the purpose, a statement in writing showing accurately the Railway Company's financial condition, including in such statement especially an exhibit of the Company's earnings and operating expenses, given month by mouth for and during a period of at least a year prior to the time of making such request.

ARTICLE 17. The term "Trustee," as employed in this instrument, shall be taken to mean the Trustee hereunder for the time being, whether said party of the second part or its successor or successors in said trust. Every such Trustee shall, in all matters involving active duty or interference with the trust, be entitled to suitable indemnity against all loss, liability and expense; shall be entitled to the advice of counsel in all matters concerning the trust; and shall be entitled to reasonable compensation for services, and to receive, on demand, all sums due it for services and expenses, which sums shall be a first lien on the property hereby conveyed and all the property in its hands belonging to said trust.

ARTICLE 19. Notwithstanding anything hereinbefore contained, no Trustee hereunder shall in any event have any duty or responsibility as to the validity hereof, or the security hereby afforded, nor as to the execution, acknowledgment, recording or renewal hereof; nor (unless and until said Trustee is called upon to take active measures to enforce the security by foreclosure or otherwise with due indemnity) as to insurance, taxes or repairs, or any other matter affecting the security; and in general it is understood that, prior to being so called upon, its sole duty is confined to certifying the bonds as of the series mentioned herein, and acting as agent in the payment of coupons and in the drawing and redemption of bonds. The representations and recitals herein contained are those of the Railway Company, and in no sense those of the Trustee.

ARTICLE 20. Twelve hundred and fifty of said bonds, numbered from 1 to 1250, both inclusive, amounting to one million two hundred and fifty thousand dollars, are to be certified and delivered by the Trustee forthwith on the written order of the President and Treasurer of the Railway Company, and the President of the Northwest General Electric Company, of St. Paul, Minnesota. But it is hereby understood and agreed that the remaining two hundred and fifty of said total issue of bonds, numbered from 1251 to 1500, both inclusive, are not to be certified by the Trustee or delivered out of its hands, except for paving or for building additional track and equipping the same, or for the purchase of additional equipment for the track already built, or for the purchase of additional rolling stock, or for making other extensions or additions to the property of said Railway Company, and then only upon the written consent of the Northwest General Electric Company, said extensions and additions to be owned, (at the time of said certification) by said Railway Company and in practical use or operation, and free from any and all liens or liability, other than the lien of these presents.

Conclusive evidence to the Trustee of the amount expended for paving or for the extensions and additions above mentioned shall be a sworn certificate of the President and Treasurer of said Railway Company setting forth said expenditures in detail, with copies of the vouchers covering such expenditures attached thereto and forming part thereof; and upon the receipt of such certificate, together with a certified copy of a resolution of the Board of Trustees of said Railway Company requesting the Trustee to certify and deliver any of said bonds, and together also with the written consent of the Northwest General Electric Company of St. Paul, Minnesota, the Trustee shall deliver to the written order of the Treasurer of said Railway Company an amount of said bonds remaining in the hands of said Trustee equal at par value to the cost of said paving or of said extensions and additions, as per said certificate, until the total amount of bonds authorized as hereinbefore set forth shall have been certified and delivered by said Trustee. But it is hereby agreed by the Railway Company that all additions to the aforesaid property that may be required to keep the same in as good order and condition as the same now is, shall not be made or allowed to become a basis for such certification and delivery of any bonds in addition to those above certified and delivered forthwith on the basis of the existing plant; and as said plant, now owned and hereby conveyed by the Railway Company, is destroyed, worn or depleted, the Railway Company agrees to replace it with other property of equal or greater value.

IN WITNESS WHEREOF, Said Tacoma Railway and Motor Company has caused these presents to be executed in its name and behalf and under its corporate seal by Paul Schulze, its President, and P. H. Kershaw, its Secretary; and said New York Guaranty and Indemnity Company has caused the same to be executed in its name and behalf and under its corporate seal by its President, and its Secretary, the day and year first above written. Executed in duplicate.

BE IT REMEMBERED, That on this day of July, A. D. 1892, before me, a notary public in and for said State of Washington, duly commissioned, personally appeared Paul Schulze, President of the Tacoma Railway and Motor Company, the corporation described in the foregoing instrument as the party of the first part thereto, who is personally well known to me, and he, being by me duly sworn, did depose and say that he is, and at the time of the execution of said instrument was, the President; that P. H. Kershaw is and then was the Secretary of said Company; that he knows the corporate seal of said Company, and that the seal affixed to the foregoing instrument as such is said corporate seal; that the seal was so affixed by authority of the Board of Trustees of said Company, and that he, as President aforesaid, signed, and the said P. H. Kershaw, as Secretary aforesaid, attested, the said instrument by like authority; and the said Paul Schulze, President as aforesaid, acknowledged the execution of said instrument as the act and deed of said Tacoma Railway and Motor Company for the uses and purposes therein expressed.

IN TESTIMONY WHEREOF, I have hereunto subscribed my name and affixed my official seal the day and year in this certificate first above written.

....
Notary Public in and for the State of Washington, residing at Tacoma.

STATE OF NEW YORK, }
CITY AND COUNTY OF NEW YORK. } ss.

BE IT REMEMBERED, That on this day of July, A. D. 1892, before me a commissioner for the State of Washington in and for the State of New York, residing in said City of New York, personally appeared President of the New York Guaranty and Indemnity Company, of the City of New York, the corporation described in the foregoing instrument as the party of the second part thereto, and who is personally well known to me, and he, being by me duly sworn, did depose and say that he is, and at the time of the execution of said instrument was, the President, and that is, and then was, the Secretary of said Company; that he knows the corporate seal of said Company, and that the seal affixed to the foregoing instrument as such is said corporate seal; that the said seal was so affixed by due authority of the Board of Directors of said Company, and that he, as President aforesaid, signed, and the said as Secretary aforesaid, attested the said instrument by like authority; and the said President as aforesaid, acknowledged the execution of said instrument as the act and deed of said New York Guaranty and Indemnity Company for the uses and purposes therein expressed.

IN WITNESS WHEREOF, I have hereunto subscribed my name and affixed my official seal the day and year in this certificate first above written.

....
Commissioner for the State of Washington in the State of New York.

ATTEMPTED ELEVATOR MONOPOLY.

Questionable Business Methods of a Quasi Trust by which it is Hoped to Drive the Electric Elevator Out of the Market.

Electricity, ever alive to the interests of its constituents, has unearthed another plot to ruin a portion of their business, and true to its traditions makes herewith a complete exposé of the same.

By way of introduction it is necessary to go a little way back into history.

Before the complete development of the electric motor to its present perfection, the increasing demand for elevator service in all modern buildings created a lively competition among those engaged in the construction and installation of this class of goods. The profits resulting from this business were large and this attracted others into the business until it was feared that with the increased competition these profits would disappear. Up to this time practically all of the manufacturers employed either one or the other of three general types of hydraulic lift, which in their hands had reached a perfection of development leaving little room for further progress. But these types of hydraulic lift were not patentable and the various manufacturers had to rely more upon business prestige and acumen than upon the detail patents which they were enabled to procure.

New comers into the business labored under the disadvantage of being less widely known to the public, but by installing first-class apparatus at a moderate and sufficient profit, bid fair to cut a wide swath in the business of the older companies. The latter to protect themselves got together and formed an alliance by which it was hoped not only to maintain the old prices but to drive out competition, no matter how honest or meritorious it might be, from those who were threatening their supremacy.

The companies thus bound together were:

The Crane, of Chicago, and its purchased company, the Hale.

The Otis, of New York, of which Mr. Crane is a prominent stockholder.

The Whittier, of Boston, largely controlled through the last two; and

The Stokes & Parrish, of Philadelphia.

To prevent competition amongst themselves these companies divided up the country into five districts in each of which one of the five companies was to hold undisputed sway. Each would bid in the others' territory, however, but not so low as to take the contract from the owner of that territory. Thus if a Chicago man asked bids from the Otis Company he was sure to find the latter underbid by the Crane, whereas if a New Yorker asked bids in Chicago for the *same* thing, he would find the Otis Company the lowest bidder. But how was this managed? It was managed in this way—all of the bids for all of the companies were made out by the same party, and that party had his headquarters in New York City in the offices of the Otis Company. All being prepared by the same deft hand, there was no likelihood of conflict between bids.

With the advent of electric wires in our streets which could be conveniently tapped on short notice in almost every business street of our large cities, and with the general installation of isolated electric lighting plants in all large modern business blocks, a new competitor threatened the supremacy of the big five. It will be understood that all of those in the combine made hydraulic elevators of nearly equal merit—for this was practically admitted by the big five—else why the combination? Besides these five, Messrs. Morse, Williams, McAdams & Courtright, in Philadelphia; Graves, in Rochester; the Standard, founded by members of Mr. Crane's family and former employees of his company; Eaton & Prince, and Winslow Brothers, of Chicago, together with some other smaller concerns, were making elevators on the hydraulic system of equal merit and all so nearly realizing the highest attainments of the art that little improvement seemed possible.

There was at least one serious defect in all hydraulic systems which seems inherent in the method, viz., that the power required to operate an elevator by hydraulic means will not adapt itself to the load. It required exactly as much power to raise the cab empty as it did to raise it with its maximum load. This was a most serious defect from the economic standpoint, and while many intelligent attempts to remedy it have been made, none have succeeded to this day. The one characteristic of the electric motor that has done more to bring it into popular favor than anything else is that it *does* adapt itself to its load, and consumes energy only in exact proportion to the requirements. It required no invention to substitute the electric motor for the hydraulic appliances, or for the steam engine and gears for steam driven elevators, and thereby was gained the decided advantage that the power required was strictly proportional to the load.

Here was a competitor which in its broadest application could not be controlled by the elevator trust or any one else. The trust secured detail patents for electric elevators, but none of these were broad enough to shut out successful competition. They therefore resorted to business methods such as would not be tolerated in Baxter street.

Practically all of the electric elevators of today, with the exception of the Sprague-Pratt machine, which is unique, consist of the old Tuft steam screw elevator with the steam cylinders and reversing valve replaced by an electric motor and reversing controller. This old-style elevator is now public property and the substitution of an electric motor for a steam engine is not a patentable idea. There remains then scarcely more than the controlling devices upon which patents can be granted. Upon these much ingenuity has been expended and in these is found the chief differences in the electric elevators now on the market.

The variety of ways in which an electric elevator can be controlled is so great that in the present state of the art it is impossible to control them all.

The trust, realizing this and also the formidable competition resulting from the new agency, resorted to the following methods:

The A. B. See Manufacturing Company shortly after they began to manufacture electric elevators heard that the Otis Company was secretly warning inquirers after elevators against buying from them as they *were going to sue* them for an infringement of patent. This disreputable business method was continued for some time with customers, but the fact of alleged infringement was never made known to the See Manufacturing Company. Mr. See finally demanded of Mr. Norton P. Otis, president of the Otis Company, to know upon what they based their charge of infringement. Mr. Otis, although still using this threat of suit for infringement as a club to force customers his way, declined to give Mr. See any satisfaction in regard to his inquiry. Not long after this incident the Otis Company served notice of a suit on one of See's customers—and this without notice to the See Manufacturing Company. The customer not being familiar with the law paid little attention to the notice of suit and the Otis Company would have taken judgment by default had not the A. B. See Company gotten wind of the matter just in time to assume the defense. Here was a very clear case of attempting to get judgment by stealth, but it was happily foiled. The patent upon which suit was brought was one granted to S. S. Wheeler, which covered devices which the A. B. See Company did not use at all. The features covered by the patent were well known ten years before the date of the patent, and no one who has looked into the matter believes that the patent would hold if tested before the courts. However, since the A. B. See Company did not use the device or ideas of Mr. Wheeler's patent it matters not whether that patent is valid or not.

Prof. Anthony in discussing this suit in 1894, concludes that there could be but one issue, and that in Mr. See's favor, on the following grounds:

1st. The elements of the combination claimed in the patent are all old, and combining them involved no invention.

2d. The combination claimed is itself old.

3d. The A. B. See Company does not use the combination.

In other words, the Otis Company had endeavored to break up a competitor's business, first by warning purchasers not to purchase his goods because of an alleged infringement; second, when confronted by the competitor himself, the Otis Company refused to state wherein he infringed; third as a pretext for carrying out a threat the Otis Company did bring suit—not against the infringer as it would have done had its desire been to establish infringement, but unbeknown to the real infringer, against one of his customers whose interests in the alleged infringement were so slight that he could not be expected to make any fight. The object of this becomes doubly clear when we study the patent on which the Otis Company sued. It was clearly to produce a moral effect upon the trade—to bulldoze it into buying trust elevators and to break up an honest competitor's business.

When Mr. Otis took the necessary oath to begin this suit he was either mentally irresponsible for what he did or he was lamentably ignorant of the responsibilities involved. There is no escape from one or the other of these conclusions.. This is not an isolated case of the dirty work of the Otis Company. Against another firm that has been in business in New York City for 25 years—a firm that is justly respected for high class work and business integrity—it brought three suits for infringement, in pursuance of its tactics.

Nothing came of these suits either, nor could anything have been expected to result from them as a result of trial. The intention evidently was to frighten the competitor out. Fortunately this competitor had too much backbone to be frightened out—it contested the suits and won.

Those unfamiliar with the elevator business cannot well understand how such a policy can hope to succeed. It will be clearer, however, when it is understood that for years the Otis Company has been considered so strong financially that it was thought to be almost suicidal in a smaller concern to measure strength with it in lawsuits. It was generally conceded that the Otis Company in pursuance of its rule or ruin policy would exhaust the resources of any smaller concern daring to come into open rebellion to its sway by overwhelming it with lawsuits which it would be unable to defend.

Other companies besides the A. B. See Company—in fact, almost every competitor in the market, whether manufacturers of hydraulic or electric elevators, or both—have found that in almost every instance where they have presented estimates for elevators the intended purchasers had been warned by the Otis Company not to purchase lest they be seriously troubled by a suit for infringement. In the case of the A. B. See Company, it appears that the only ground for suit by the Otis Company was their claim that they possessed the exclusive right to use a shunt wound electric motor in connection with an elevator. But this company has not confined its peculiar business methods to electrical competitors. They have treated nearly all competitors alike—their general method being first to threaten the customers of their competitors with suit, and then having exhausted the moral effect of this, to actually bring suit, usually upon some untenable ground, and keep this pending suit hanging over them as long as it was possible to do so without bringing it to trial, using it in the meantime as a most effective weapon against those who dared to enter the field which the Otis Company seem to think has been preempted entirely for their benefit.

While the favorite method employed by the Otis Company and the Elevator Trust has been the disreputable one to threaten intending customers of their competitors with suit for infringement, this has not been their only method. They have in some cases endeavored to steal the contract from a competitor even after it had been awarded. One of the most noteworthy illustrations of this occurred at Minneapolis recently. Bids for the equipment of the Minneapolis City Hall and Court House with elevators were opened on Feb. 19, 1895. There were fourteen altogether and the award was finally made to the Sprague Company for its electric elevators for the first section on a vote of 8 to 1.

Pending settlement of the details of the contract an injunction was issued against the commission, nominally on the application of a "taxpayer," but really at the instigation of the Crane Co., to prevent the signing of the contract with the Sprague Co.

In support of the application for the injunction, affidavits from the following people were submitted:

Norton P. Otis, president of the Otis Elevator Company.

Wm. E. Hale, former president of the Hale Elevator Co.

Thomas E. Brown, consulting engineer of the Otis Co.

George K. Reynolds, chief engineer of the Crane Elevator Co.

Thomas M. McGuire, consulting engineer of the commission and agent for supplies of the Crane Co.

Frank Elmer Herdman, electrical engineer of the Crane Co.

Frederick H. Prince, president of the Eaton & Prince Elevator Co.

Charles N. Coen, former general manager of the Hale Elevator Co., now salesman of the Crane Co.

Wm. H. Coen, vice-president and general manager of the Crane Elevator Co.

S. G. Cook, who is operating Crane elevators.

J. C. Freeman, J. Hutchinson and Albert Stevenson, all three being represented as chief engineers of the Owings Building, Chicago, likewise using Crane elevators.

In spite of this array of hydraulic interests the injunction was dissolved, although four days were granted for additional affidavits. The filing of such additional affidavits was abandoned, but the Crane Co. presented instead another bid for which they requested consideration, making the most astounding claims.

These latter statements of the Crane Co. were submitted to Mr. Wm. De La Barre, hydraulic engineer of the Minneapolis Milling Co., for an independent expression, and a copy of his reply is given below:

William De La Barre, Engineer of the Minneapolis Milling Company.

Dear Sir: The Construction Committee of the Court House and City Hall Commission has instructed me to ask you for a written opinion concerning the proposition of the Crane Elevator Company to run an elevator with 7½ horse-power to an altitude of 96 feet 8 inches on a one-minute schedule, the machine being adjusted to carry 3,600 pounds live load. Is the test they propose such a one as you would recommend as a basis to compute the cost of operating expenses in actual service, or is it a mere trick intended to hide the exact truth? In addition to this, will you kindly answer the following questions:

First—Can a hydraulic elevator in actual everyday service do as much work with 7½ horse-power of energy as an electric elevator can with 40 horse-power, the efficiency of the electric machines being as great or greater than hydraulic?

Second—How much more could the county afford to pay for six Winslow elevators with Reidler pumps than for six Crane elevators with pumps listed in their bid at $16,780, computations of running expenses in each case to be based on pounds of steam per horse-power given in their schedules, the machines being adjusted to carry 3,600 pounds live load, with 300 pounds underbalanced car and sixty per cent. efficiency, making the round trip of ninety-six feet in one minute, ten hours per day and 315 days in the year, eight pounds of water to one pound of Youghiogheny coal at $4 per ton of 2,000 pounds, and interest for the investment at 4½ per cent.?

Third—How much more could the county afford to pay for electric elevators than for the six Crane elevators in question, using same figures, excepting to take into consideration the fact that electric elevators use power only in proportion to the load carried, on an average six passengers a trip, and using thirty-five pounds of steam per horse-power?

To these queries Mr. De La Barre responded in writing as follows:

Oliver T. Erickson.

Dear Sir: In reply to your written request of March 22, 1895, with reference to the proposition of the Crane Elevator Company and others, permit me to state that I have examined the papers submitted to me, and, assuming the figures and facts given therein to be correct, I would say that I should not regard the test proposed by the Crane Elevator Company convincing or conclusive with regard to the operating expenses during actual service.

The answer to your second question is $13,555 for each elevator, or $81,318.66 for six elevators, assuming each of them to work under identical conditions.

The answer to your third question is $14,454.66 for each elevator, or $98,722.96 for six elevators, assuming each to work under identical conditions. This is on the basis of seventy per cent. efficiency for the electric motors.

The Hydraulic Elevator Trust, it seems, has a strong ally in the Henry R. Worthington Co., manufacturers of hydraulic pumps used in elevator service. In the fight against the Sprague Electric Elevator Co. at Minneapolis, the Trust called upon this ally for assistance, and it was rendered by an agent of the Worthington Co., who, in behalf of the Crane Co., stated among other things that an electric system would require eight times the coal of a hydraulic system.

This was communicated in a letter signed "Henry R. Worthington Co., by B. F. Slocum." Upon this becoming known to the Sprague Co., the following correspondence ensued:

New York, November 27, 1894.

Henry R. Worthington Co., 86 Liberty street, City.

Gentlemen: We beg to enclose you a copy of a letter signed "Henry R. Worthington Co., by B. F. Slocum," presented to the Board of County Commissioners, Court, House and City Hall Building, Minneapolis, Minn., at the recent opening of the bids for elevators. In view of the remarkable statements made in this report, not alone with regard to the Worthington apparatus, but relating to the electric elevator as manufactured by this company, we beg to inquire whether the statements therein contained are endorsed by you, or are made on the responsibility of Mr. Slocum. Very truly yours,

SPRAGUE ELECTRIC ELEVATOR COMPANY,
(Signed) By Frank J. Sprague, Vice-President.

They replied as follows:

Brooklyn, N. Y., November 30, 1894.

Sprague Electric Elevator Company, 253 Broadway, New York City.

Gentlemen: We have read the communication sent us under cover of your favor of the 27th inst., and fail to see on what grounds you assume to cross-question us concerning its contents. In the absence of any direct statement in it, your assumption that your elevator is the one referred to by our salesman may or may not be correct.

It seems to us that, if there is any question as to the correctness of the calculations, it should properly be raised by the County Commissioners, to whom the communication is addressed, and that no good can come to any of the parties interested in this particular case by transferring the discussion from Minneapolis here. Yours truly

HENRY R. WORTHINGTON,
(Signed) Charles C. Worthington, President.

This letter so palpably begged the question that Mr. Sprague wrote as follows:

December 1, 1894.

Charles C. Worthington, Esq.,
President Henry R. Worthington Co., Brooklyn, N. Y.

Dear Sir: We have your letter of November 30, in reply to ours of the 27th ultimo. We regret that you should evade the issue raised in our letter. Under the circumstances we have every ground "to assume to cross-question you." The copy of the communication sent to you, signed by your Mr. Slocum, purported to present two sides of the elevator question—one the advantages of the hydraulic depending upon Worthington apparatus, the other the disadvantages of the electric

You must be well aware that the questions which have arisen at Minneapolis are not between the Sprague-Pratt and any other electric elevator, but directly and simply between two typical systems, with one of which you are somewhat closely identified, and of the other of which we happen to be the representatives.

We shall not discuss here the correctness of the statements made so far as they relate to hydraulic elevators in general, or the Worthington pump in particular—that we shall take up in due time; but, so far as the statements made relate directly or by inference to the electric elevator built by this company, they are in a large measure untrue and misleading, and we have every right to require the principal either to indorse the statements of a subordinate or correct them.

It may be, as you say, "that no good can come to any of the parties interested in this particular case by transferring the discussion from Minneapolis here," if by "any of the parties" you mean the hydraulic interests. We quite coincide with this view.

In spite of your diffidence we are still constrained to ask, without entering into any discussion of your representative's communication, whether the Sprague-Pratt electric elevator was the one referred to in that communication. That question, at least, is simple enough.

Yours truly,
SPRAGUE ELECTRIC ELEVATOR COMPANY,
(Signed) By Frank J. Sprague, Vice-President.

No reply has been received as yet to this last letter.

Mr. George K. Reynolds, the engineer of the Crane Company, had also been making a number of remarkable statements calculated to injure the Sprague Company, and to him Mr. Sprague addressed the following:

New York, November 28, 1894.

George K. Reynolds, Esq., Consulting Engineer, Crane Elevator Co., Chicago, Ill.

Dear Sir: We understand that at a meeting before the Commissioners of the Court House and City Hall Building, Minneapolis, Minn., you recently made the statement that the screws of the Postal Telegraph elevators had worn out and had been replaced, and that we carried spare screws to replace such as were liable to give out.

We wish to know if this version of your statements is correct, and if you, over your signature as the representative of the Crane Elevator Company, will put those statements in writing. Very truly yours,

SPRAGUE ELECTRIC ELEVATOR COMPANY,
(Signed) By Frank J. Sprague, Vice-President.

To this also no reply was received.

Later, when the commission visited New York, the statements of Norton P. Otis, the president of the Otis Elevator Company, and his agents were of such a character that the Sprague Company was constrained to send another registered letter as follows:

January 24, 1845.

Norton P. Otis, Esq., Otis Elevator Company, New York City.

Dear Sir: You have recently made a statement to the effect that the screws of the Postal Telegraph elevators have been several times worn out and replaced. I believe it is my right to ask if that statement is made on hearsay, and, if so, your authority; or if it is made on your personal responsibility.

If the former is the case, it is not your privilege to repeat it without your personal knowledge; and if the latter, then I have to ask if you will state in writing, over your signature, either personally or as an officer of the Otis Elevator Company, that any screw in the Postal Telegraph plant has ever worn out, or that any screw for that purpose has ever been replaced. Frankly, I wish to place the responsibility for that sort of statement where it belongs. Yours truly,

(Signed) FRANK J. SPRAGUE, Vice-President.

The above merely shows one phase of the methods employed by the Trust to defeat honorable competition. The particular animus which led to the employment of these methods exists still and is indicated by the fact that the Sprague and the Crane companies had had a somewhat important contest and the latter had been defeated in the award of a contract for fifteen elevators in the Parrot Building, San Francisco, so that it came to be commonly reported in Minneapolis that the Sprague Company must be defeated there, no matter what it cost, for the Crane Company realized that, should the San Francisco decision be followed by another similar one, their power in the Northwest would be broken, and they could well afford to put elevators in the Court House for nothing to prevent such a blow to their prestige.

But notwithstanding these underhand methods the award was made to the Sprague Company by a vote of 8 to 1 of the commissioners. The dissenting commissioner was Mr. John De Laittre, and he in defence of his position made the following written statement:

That the first cost of an electric plant for the entire building would be at least $40,000 more than a hydraulic.

That it is easy of demonstration that the operating expenses and fuel bills would be more than doubled by the use of the electric system.

That he is fully aware of the powerful influence of the "Sprague-Pratt" Company in Minneapolis and of their intimate relations with the Postal and North American Telegraph Companies.

That the amount of the Sprague Company's bid for electric elevators, covering electric generators and engines, using a total of 160-horse power for the four elevators, is $29,875.

That the bid of the Crane Company for the highest type of hydraulic elevators, using triple-expansion pumps and using 30-horse power for the four elevators, is $17,480.

That the power required by the four Sprague elevators is five and a third times that of the four Crane elevators.

That the total cost of 12 elevators of the "Sprague-Pratt" type, including generators and engines, would be $85,125, and it would require two 250-horse power engines to operate the dynamos required by the "Sprague-Pratt" machines.

That the total cost of a like number of the best type of Crane elevators would be $33,760, and that it would require 90-horse power to operate them.

That the excess of the cost of the Sprague electric elevators over the Crane elevators would be $51,365.

That twelve "Sprague-Pratt" elevators will require an average of 480 electric horse power at an annual cost of $11,520, whereas twelve hydraulic elevators will require an average of 90-horse power at an actual cost of $3,240.

Each and every statement thus epitomized is false. There is absolutely not one single exception. The statements are not only false, but there is not in the bids which were presented to the commission any excuse for the presentation of them.

Mr. Sprague in replying to these statements says:

In my letter of transmittal of February 14th, which was certainly open for Mr. De Laittre's inspection, and from which he had no business to make a garbled extract, I stated that the generating plant should consist of two dynamos of 80 kilowatts capacity each, one of which would be ample for the operation of the four elevators under actually normal conditions; that two would enable six loaded cars to be simultaneously hoisted under the full load, a condition, however, which under normal practice would never occur; and that these same two units would supply the current necessary for operating the entire plant of twelve elevators under their normal conditions of service.

It should be further borne in mind that the dynamo and engine plant proposed was not merely to take care of the average load, but to provide for those extreme conditions which arise by the combination of movements of elevators, and that the average demand would not exceed one-half the capacity of the dynamo plant.

The maximum engine power provided, instead of being two 250-horse power engines, would be two 120-horse power engines.

The average electrical power used would be 4-horse power hours per car mile of travel.

With twelve elevators on a regular service of forty round trips per hour, the loads which will obtain in practice are such that the average electrical horse power delivered to the entire battery will be about 72-horse power instead of 480; that is, less than one-sixth of "Expert" De Laittre's estimate.

Instead of 90-horse power delivered to the water column of the hydraulic elevators, there would be about 150-horse power required under exactly equal mileage and service.

There is a radical difference between hydraulic and electric elevators in that hydraulic elevators are pressured for the maximum load which they must be able to carry, and use for every foot of travel the same amount of water independent of the load, while the electric elevator takes advantage of the falling off of actual duty and uses power in proportion to the actual combined friction and live loads.

Instead of $17,480 being the Crane bid, including triple-expansion pumps for high pressure service, the bid taken from the list published in the *Times* of February 19, was $26,261, $8,781 more than was stated by Mr. De Laittre, and the total cost of the Crane high pressure service with triple-expansion pumps would be $42,541 instead of $33,760.

It must be borne in mind, however, that, while the electric plant has the street for reserve in case of the failure of an engine or dynamo (and under conditions of very slack service, as at night or on Sundays and holidays, such street reserve can be most advantageously used, saving both in power-operating expenses and in attendance), there is no need to put in an additional dynamo and engine. It would be absolute folly, however, to put in a hydraulic plant without a reserve pump.

If any Crane bid had been accepted it would probably have been for the highest-priced apparatus, and it should have included a reserve pump, so that the cost, to say nothing of those extras which the installation of hydraulic elevators at some distant future could have easily added, would have been about $46,525.

The Sprague Company's bid for the four elevators, excluding engines and dynamos, was $19,925.

Its lowest bid, under which they have stood ready all along to equip the plant, including the necessary dynamo, was $22,180, and, with the necessary compound engine of the highest type, would be $24,100, instead of $29,875.

The company's bid for the four elevators, including the necessary dynamos to operate the twelve elevators under the conditions of actual service, was $24,485, and, with the best type of compound engines to operate them, $28,275, instead of $29,875.

The total bid of the Sprague Company for the twelve elevators, with engines and dynamos, is $67,875, instead of $85,125, or a difference of $17,250.

Again, deducting from the De Laittre statement the cost of our eight extra machines, our first cost, according to De Laittre, for the four elevators with engines and dynamos, would have been $45,525, instead of the actual bid of $28,275.

According to this same expert estimate of the cost per horse power per month for the generation of electric or hydraulic power—which I am perfectly frank to say is low--since we will use an average of 72-horse power, as absolutely metered, against 480-horse power, the cost per year would be $1,728, instead of $11,520, a difference of $9,792, while the hydraulic cost would be $5,400 as against $3,240.

These statements, so far as absolute costs are concerned, are both absurd, the cost of power being under the truth in either case, but the ratios which I have given are correct, and will affect both plants alike.

Referring now to the bids of the Sprague and the Crane and the Winslow companies for apparatus as it would necessarily have to be completed, there is an actual difference between the Sprague and the Crane companies of $21,350, instead of $51,365, or $30,015 less than stated by Mr. De Laittre, and there is an excess of the Sprague Company over the Winslow Brothers' bid of about $7,875, the difference between the Crane and the Winslow estimate fairly representing the amount which the Crane Company were willing to sink to carry this contract in their favor as against the Sprague Company.

In order to make the preceding statements clear we have arranged them in tabulated, form giving the facts, the De Laittre statements, and the differences, as follows:

Cost of 4 Sprague-Pratt electric elevators, with necessary dynamo to operate them	$22,180
De Laittre's statement	25,575
Difference	$3,395
Cost of same with best type compound engine	$24,100
De Laittre's statement	29,875
Difference	$5,775
Cost of 4 Sprague-Pratt electric elevators, with compound engines and dynamos necessary to operate the 12 elevators in regular service	$28,275
De Laittre's statement, being his total of $85,125 less the cost of the 8 machines	45,525
Difference	$17,250
Total cost of 12 Sprague-Pratt electric elevators, with multipolar generators and compound engines	$67,875
De Laittre's statement	85,125
Difference	$17,250
Cost of 4 Crane high-pressure elevators, with piping and pumps for operating 12 elevators, but without reserve	$26,261
De Laittre's statement	17,480
Difference	$8,781
Total cost of Crane high-pressure plant, with best pumps, without reserve	$42,541
De Laittre's statement	33,760
Difference	$8,781
Total cost of Crane plant, including reserve pump, about	$46,525
De Laittre's statement	33,760
Difference	$12,765
Cost of 4 Winslow Brothers elevators, with piping for high-duty machines, without reserve	$34,160
Total cost for 12 Winslow elevators, no reserve	56,160
Total cost Winslow elevators, with reserve, about	60,000
Average electrical h. p. to operate 4 Sprague-Pratt electric elevators on actual service	18 h. p.
De Laittre's statement	160 "
Difference	142 h. p.
Average power in water column required to operate 4 Crane hydraulic elevators	50 h. p.
De Laittre's statement	30 "
Difference	20 h. p.
Maximum engine-rated h. p. provided to operate the complete Sprague plant	240 h. p.
De Laittre's statement	500 "
Difference	260 h. p.
Average electrical h. p. required to operate the complete Sprague plant on normal service, as metered	72 h. p.
De Laittre's statement	480 "
Difference	408 h. p.
Average steam h. p. required to operate the Sprague plant	125 h. p.
De Laittre's statement	500 "
Difference	375 h. p.
Average power in water column required to operate 12 Crane hydraulic elevators, like duty	150 h. p.
De Laittre's statement	90 "
Difference	60 h. p.
Equivalent steam h. p. if used in an engine for same water evaporation, at least	250 h. p.
Excess cost of Sprague-Pratt plant over Winslow Brothers	$7,875
Excess cost of Sprague.Pratt over Crane high-duty	$21,350
De Laittre's statement	51,365
Difference	$30,015

We could go on multiplying instances of similar methods of business encountered by every one not in the Trust, but the above will doubtless be sufficient to indicate the dishonorable methods which have for years characterized the Otis Co. and its allies, the other members of the Elevator Trust. These methods have been employed against those not building electric elevators as well as against those who do. We are only specially concerned because of the attempts to drive one of the most promising branches of electrical development from the field, but we have the interest that all honorable people have in seeing dirty and dishonest methods banished, and are among those who believe that the Otis Co. and its allies have put themselves without the pale of association with honorable business men whether electrical or non-electrical.

An Application of Electricity to the Bleaching of Oils and Fats.

It has recently been claimed that oils and fats may not only be bleached but sweetened and purified generally by treating them with an electric current. The system upon which this is effected is as follows: There is a tank divided into two parts by means of a porous partition; in one of the compartments thus formed is placed a solution of common salt at 8° Twaddell strength, and immersed in this solution is a carbon electrode. In the other compartment there is a mixture of the oil or fat with a similar salt solution, and immersed in the mixture is a copper electrode. A continuous electric current is then generated by means of a dynamo, the oil and salt solution being agitated by mechanical means at the same time.

A. I. E. E.

NIAGARA FALLS MEETING.

Preliminary Programme.

The General Meeting of the American Institute of Electrical Engineers will be held at the Cataract House, Niagara Falls, N. Y., beginning on Tuesday, June 25, at 10 A. M. and continuing four days. The following papers will be presented:

1. "The Substitution of Electricity for Steam in Railway Practice" (inaugural address), by the President, Dr. Louis Duncan, of Baltimore.
2. "Properties of Fuse Metals When Subjected to Short Circuits," by Walter E. Harrington, of Camden, N. J.
3. "Location of Grounds in Armatures, Fields, etc.," by Clarence E. Gifford, of Jamestown, N. Y.
4. "Some Features of Alternating Current Systems," by Chas. P. Steinmetz, of Schenectady, N. Y.
5. "Theory of General Alternating Current Transformer," by Chas. P. Steinmetz, of Schenectady, N. Y.
6. "Compounding Dynamos by Armature Reaction," by Elihu Thomson, of Lynn, Mass.
7. "Existing Commercial Applications of Electrical Power from Niagara Falls," by W. L. R. Emmet, of Schenectady, N. Y.
8. "Alternating Current Curves," by Dr. C. E. Emery, of New York.
9. "Electric Power in Factories," by Prof. Francis B. Crocker, Messrs. Benedikt and Ormsbee, of New York.
10. "Some Observations on a Direct Connected 300-Kilowatt Monocyclic Alternator," by Profs. Dugald C. Jackson and S. B. Fortenbaugh, of Madison, Wis.
11. "On Mechanical Models of the Electric Current," by Prof. Brown Ayres, of New Orleans, La.
12. "On the Cause of Death in Electric Shock," by Albert M. Bleile, M. D., of Columbus, O.
13. "Long-Distance Power Transmission at 10,000 Volts" (the Pomona plant), by George Herbert Winslow, of Pittsburg.
14. "Notes on the Reconstruction of a Small Central Station Plant," by Franklin Leonard Pope, of Great Barrington, Mass.
15. "On Rating the Performance of Electric Power Plants and Transmission of Varying Loads," by Prof. Wm. S. Aldrich, of Morgantown, W Va.
16. "Work of the Westinghouse Electric and Manufacturing Company for the Cataract Construction Company of New York," by L. B. Stillwell, of Pittsburg.

Among the objects of engineering interest which it is proposed to visit are the new works of the Niagara Falls Power Company, the Niagara Falls Park and River Railway on the Canadian side, the aluminum plant of the Pittsburg Reduction Company, the plant of the Carborundum Company, the central station of the Niagara Falls and Buffalo Electric Light and Power Company.

TRANSPORTATION.

The Convention rate of one and one-third fare for the trip has been granted by the Trunk Line Association, conditional upon an attendance of 100 members and guests.

Wherever the number warrants arrangements will be made for a special car. From New York City the following trains and routes are suggested:

New York Central, 1 P. M., June 24, single fare....	$9.25
West Shore, 6 P. M., June 24, single fare............	8.00
Lehigh Valley, 6 or 9 P. M., June 24, single fare....	8.00

Personal.

Mr. Stanley S. Stout, attorney for the Western Telephone Construction Company, Chicago, was in New York last week, returning home via Washington.

Mr. W. C. McKinlock, the genial secretary of the Metropolitan Electric Company, Chicago, has just returned from a Southern trip. He has secured some profitable orders and reports a decided improvement in business.

Recent Experiments on the Electric Discharge by Lord Armstrong.*

At the last conversazione of the Royal Society, Lord Armstrong exhibited on the lantern screen a remarkable series of photographs and dust figures produced by the action of very powerful electric discharges. Most of the effects were obtained by the use of a large multiple Wimshurst machine, having sixteen plates of 34 inches diameter, made by Newton & Company, and capable of giving a spark of about 17½ inches. The machine was fitted with two 10-gallon Leyden jars as condensers, and was found perfectly adapted for the purpose of the experiments. The photographs were mostly obtained by the well-known method of causing the discharge to pass over the surface of a photographic plate with which the electrodes had been placed in contact. The dust figures were produced by discharging on glass or metal plates over which had been sifted various more or less non-conducting powders, such as calcined magnesia mixed with carbon in the form of lampblack, tripoli powder and hard carbon reduced to a fine powder. We are able this week, by the courtesy of Lord Armstrong, to reproduce what appears to us some of the most suggestive figures. Many of the results obtained appear to be quite inexplicable; they are, therefore, all the more interesting to the electrical theorist, and no doubt when the true explanation is arrived at we shall have made a great advance in our knowledge of molecular physics and of the true nature of electricity.

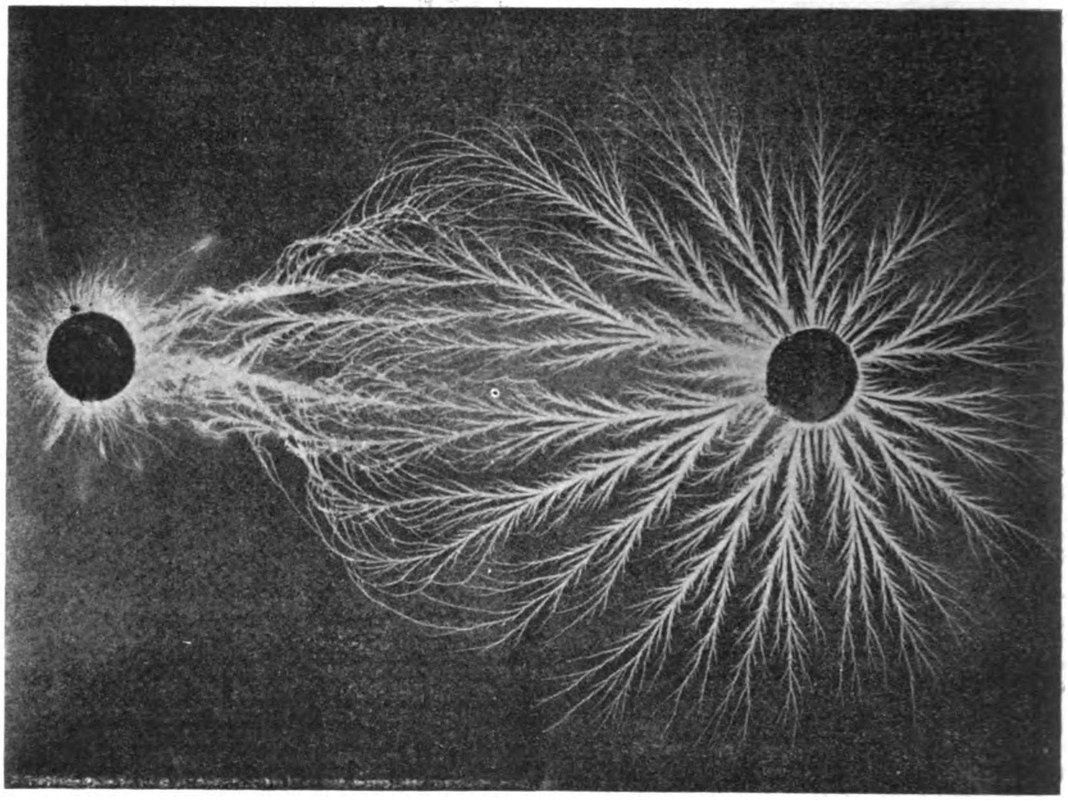

FIG. 1.

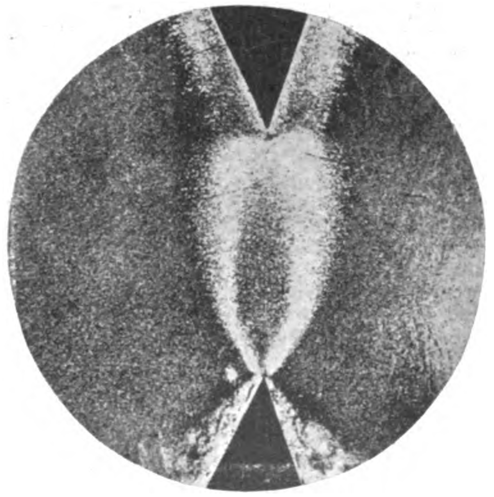

FIG. 2.

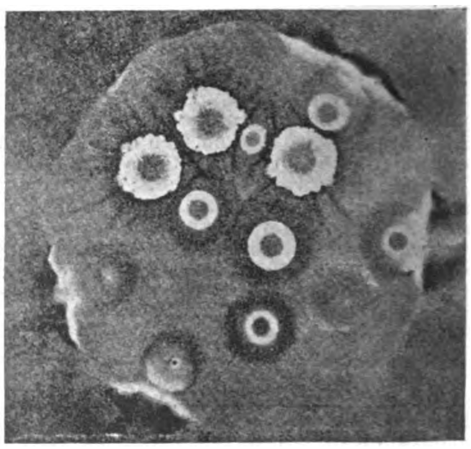

FIG. 3.

An exceedingly interesting experiment performed by Lord Armstrong in 1843, and repeated in an improved form before the Literary and Philosophical Society of Newcastle in 1893, appears to throw a good deal of light on some of the results shown in these figures. In the experiment as originally performed, two wine glasses were filled to the brim with chemically pure water, and the two glasses were connected by a cotton thread coiled up in one glass, and having its shorter end dipped into the other glass. On causing a strong current to pass across the moist thread from one glass to the other in the right direction, the coiled thread was rapidly drawn out of the vessel containing it and deposited wholly in the other, a rope of water being left suspended for a few seconds between the lips. In the improved form of the experiment shown in 1893, a glass bulb was used having a long neck on one side and a short nozzle on the other, the nozzle having an aperture of $\frac{1}{10}$th of an inch in diameter. Through this aperture a string composed of spongy cotton thread was passed. The string was barely sufficiently thick to fill the aperture, and was secured by a knot or otherwise to a conducting wire which entered the bulb through a cork at the top of the neck. The bulb was plunged into a glass cistern filled with distilled water, which was also allowed to fill the bulb. When a positive current was sent into the bulb, the water in the cistern being connected with the negative pole, the cotton was seen to climb up into the bulb, while a current of water could be seen flowing downwards out of the bulb all round the cotton. On reversing the current the movement of the cotton was reversed; the cotton always moved opposite to the conventional direction of the electric current, i. e , towards the positive pole.

---

* From the *Electrical Review* (London.)

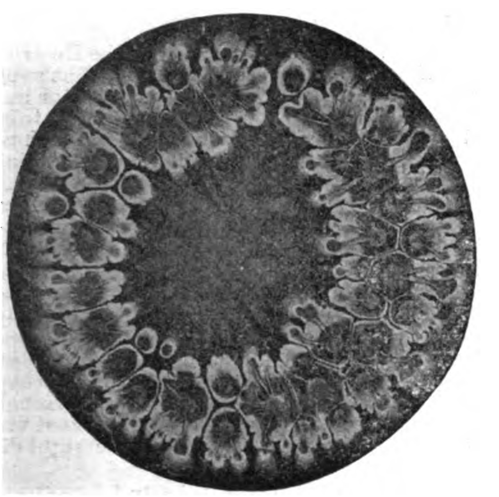

FIG. 4.

In many of the figures this tendency of the discharge from the positive pole to flow outside and encircle the discharge from the negative pole is shown in a remarkable manner. In the photograph Fig. 1, the branching discharge which radiates in all directions from the positive pole is seen to encircle the compact bundle of sparks proceeding from the negative pole. The way in which the terminations of the positive sparks bend towards the central negative current of sparks is especially noteworthy. The two currents acting together appear to be striving to form a kind of vortex ring. Lehmann has actually produced vortex rings by discharging from a pointed electrode in certain liquids. The dust figure (Fig. 2) shows very distinctly what appears to be a vortex ring or tube circulation between pointed electrodes. Fig. 3, which is produced, like the Kundt figures, by discharging upon a negative terminal coated with a film of dust, appears to show a section of the vortex tube circulation. As Lord Armstrong describes it, the effect resembles that which would be produced by sucking up a tube and blowing down the annular space surrounding it. The general shrinkage of the dust film and the breach of continuity at the margins is noteworthy; also the tendency to form separate craters representing the sections of the hypothetical vortex tubes. This tendency of the small craters to preserve their individuality is still more remarkably shown in Fig. 4, which represents a dust figure produced by a shower of negative lines discharged from a ring. The dust craters are crushed out of their natural circular form by overcrowding, but show no tendency to coalesce. Fig. 5, which is a dust figure formed by a spark, shows again the central circulation of the dust [from the negative to the positive pole, and the outer return current. Fig. 6 is a dust figure produced by the passage of a very powerful electric spark. The loose dust is swept off or thrown into confusion by the violence of the spark, but the finer particles adhere to the glass and retain the markings impressed upon them.

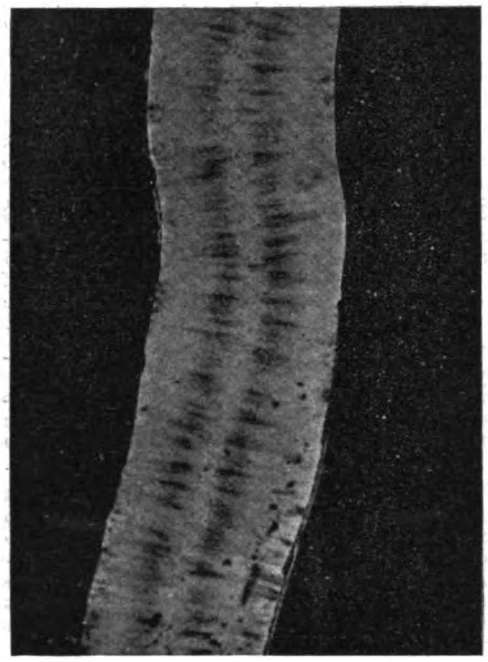

FIG. 6.

(*To be continued.*)

London Notes.

(From our Special London Correspondent.)

TELEGRAPHY BY INDUCTION.

Mr. W. H. Preece, C. B., F. R. S., has been lecturing in London on this subject. He said that the first induction experiments were made in 1884 by himself and Mr. Lindsay, on the astonishing fact that a message transmitted from the General Post Office, London, to Bradford by an overhead wire could be read through an underground wire by an operator in the telephone company's exchange room, also in London, although the two parallel wires were nowhere nearer together than eighty feet apart. This was the origin of the practical inquiries which, during the past ten years, had been carried out by the Post Office electrical department, and by which it had been fully proved that where parallel wires of considerable length can be isolated, messages can be carried across between them by the ether of space independent of weather. After referring to various successes secured, he dealt with the final practical success which was obtained in March of this year. The cable connecting the Isle of Mull with the mainland at Oban was broken, and before the cable ship came round to make repairs communication by induction was interpolated. The width of the channel at the points selected for inductive circuits varies from 1¼ to 2 miles. The distance between the overhead wire and the mainland is almost uniformly two miles. As there were no existing wires on the mainland parallel with the overhead wire, a gutta-percha insulated wire was laid along the ground from Morven in a northwesterly direction for about a mile and a half. It was earthed at Morven in a running stream a mile away from the sea, and at the other end it was earthed in the sea itself. The wire joined up for the inductive circuit was at first 12 miles, but the resistance of the circuit was too great, and a division was made at the point exactly opposite the termination of the Morven gutta-percha wire. Until this was done satisfactorily, communications could not be established. The traffic actually dealt with by this arrangement between March 30 and April 3 was 110 ordinary messages and one press message of 120 words. By this time the repairs of the cable were completed.

LEGAL NOTES.

Mr. J. H. Vail has been appointed receiver for the Electrical and Mechanical Engineering Company at 41 Cortlandt street. The liabilities are $26,441, and the nominal assets are $22,000, consisting of book accounts, accounts payable from contracts in process of completion, furniture and fixtures.

Ridsdale & Lewis, dealers in electrical apparatus at No. 59 Cortlandt street, have assigned to Edward Swann.

General News.

What is Going on in the Electrical World.

Rockwell City, Iowa.—There is talk here of getting electric lights.

Hamilton, Ont.—Tenders for lighting the city will be asked for at once.

Hull, Mass.—This city has voted to issue $60,000 five per cent. sinking fund electric light bonds.

Clyde, N. Y.—The Clyde Electric Light Works was damaged by fire on the 4th inst. to the extent of $1,000.

Lansing, Mich. —The Senate has passed a bill appropriating $25,000 for an electric light plant for the State University.

Sioux City, Iowa.—The big warehouse of the Sioux City Electric Light Company was entirely destroyed by fire a few days ago.

Union Springs, Ala.—The city council is considering a proposition from an electric light company to put in a system of arc lights.

Norwalk, O.—A proposition to have the city put in an electric light plant costing $25,000 is to be submitted to a vote of the people.

Clarksville, Tenn.—The Clarksville City Railway Company will purchase electrical equipments. Wm. Daniels president.

Gainesville, Ga.—D. E. Evans is interested in a company being organized to build an electric line in this city and suburbs.

Butte, Neb.—A project is on foot to secure the necessary capital for the construction of a trolley line between this place and Stuart.

Lake City, Minn.—Electric light bonds issued by this city to the amount of $6,000 have been sold to the Lake City Bank of Minnesota.

Woonsocket, R. I.—The machinery in the shoe factory to be erected here by Assemblyman Dulude will be operated by electric power.

Pottsville, Pa.—The county commissioners will visit the alms-house to arrange for the erection of a boiler-house and electric light plant.

Willmar, Minn.—The people of this place have voted to empower the city council to erect an electric light plant at a cost not to exceed $5,000.

Fort Madison, Ia.—J. C. Hubinger has petitioned the council for a franchise to operate an electric street railway on certain streets of this city.

Crockett, Tex.—The city council has granted to F. Lockfield, of Waco, Tex., a franchise to put in an electric lighting plant, to be in operation October 1.

Chicago.—The new electric elevated railroad is rendering satisfactory service. The Logan Square branch has been added to the portion already in operation.

Logansport, Ind.—Influential citizens of Burlington are trying to interest our capitalists in the projected electric railway to connect Burlington with Logansport.

Allegheny, Pa.—The Western Electric Company secured the lion's share in the awards for electrical supplies for the city, bids for which were opened a few days ago.

New Orleans, La.—The Canal and Claiborne Street Railway Company is preparing plans to change its line into an electric system. It has 18 miles of road.

Guthrie, Okla.—The Woodward Water, Heat and Power Company has been chartered here to put in a waterworks and electric light plant at Woodward. Capital stock, $25,000.

Fort Wayne, Ind.—A. B. White, of Fort Wayne, is interested in the project of building an electric railway in Fort Wayne, and in the town of New Haven, six miles distant.

North Hempstead, N. Y.—H. R. Newkirk, Benjamin Hicks and others have applied for a franchise to construct and operate an electric street railway at Great Neck, L. I.

Clarksville, Tenn.—The Clarksville Street Railway Company is prepared to receive proposals for machinery, cars, etc., for an electric railway. Wm. N. Daniel, president.

South Amboy, N. J.—Representatives of the proposed electric railway will apply to the mayor and council of South Amboy for a franchise to run the road through certain streets of the borough.

Spartanburg, S. C.—A scheme is being developed to connect this city with five or six contiguous factory towns by an electric railway. The leading business men are all favorable to the project.

Bellefontaine, O.—The city council has ordered that the clerk advertise for contracts to build the electric light plant, according to plans prepared by Mr. Roberts and adopted by the electric light committee.

Boston.—The change from steam to electricity on the Nantasket branch of the N. Y., N. H. and Hartford Railroad will be fully accomplished by the middle of June, when tests will be made of the new system.

Crisfield, Md.—Thomas H. Bock, of the firm of Cohn & Bock, flour and lumber manufacturers at Princess Anne, Md., proposes to construct an electric railway from Princess Anne to Deals Island, a distance of sixteen miles.

Newark, O.—The Citizens' Electric Light and Power Company has awarded the contract for the electrical apparatus to be used in the new plant here to the Westinghouse Electric and Manufacturing Company of Pittsburg.

Syracuse, N. Y.—The Syracuse Street Railroad Company has asked the highway commissioners for a franchise for a double track electric road from the southern limits of the village of Elmwood to Card's hotel at Onondaga Valley.

Montpelier, Ind.—The matter of building an electric railway to connect Hartford City, Ind., and Montpelier is being agitated. The line, if built, will be nine miles long. J. P. McGeath, of Hartford City, is one of the promoters.

Riverton, N. J.—The scheme for bonding the borough of Riverton for an electric light plant was revived at a meeting of council the other night, and a resolution adopted to carry the matter through the Supreme Court.

Hingham, Mass.—The franchise for the proposed electric street railroad through Hingham to the Hull line has been secured by Deacon Josiah Reed, of South Weymouth, and it is said that work will be commenced at once.

Pueblo, Col.—The Pueblo City Railroad is to be sold to satisfy a mortgage of $500,000, on an order made by Judge Halleck in the Federal Court. The property it is thought will be bid in by the General Electric Company.

Laporte, Ind.—The Michigan City and Laporte Electric Railway Company intends, if possible, to complete the building of their road this summer. Russell Harrison is supposed to have a controlling interest in the new company.

Greenbush, N. Y.—The trustees have deferred action on the application for a franchise of the Albany Railway until June 18. The railway company asked consent to construct and operate an electric street railroad on certain streets in Greenbush.

Macon, Ga.—The Consolidated Street Railway Company has asked the council for permission to erect poles on which to string wires for electric light and power circuits. The Macon Gas, Light and Water Company also intends to put in a power circuit.

Stoneham, Mass.—The plan for an electric street railway between Stoneham, Winchester and Arlington, which was agitated about a year ago, is being revived. Onslo Gilmor, of Stoneham, and A. D. Coehran, of Winchester, will be on the board of directors.

Tacoma, Wash.—The purchase of the Steilacoom electric line by the Tacoma Railway and Motor Company, of which Paul Schulze, now dead, was president, is being investigated, and the probability is that a separation of the two systems will result.

San Diego, Cal.—An electrical expert has been here figuring on the establishment of a plant to supply this city with electric power, which is to be secured from a waterfall on the flume line, about twenty miles from the city. About two thousand horse-power will be generated.

Richmond, Va.—The committee on light of the common council has been instructed to secure plans and specifications for the erection of an electric plant of a capacity of 600 arc lights of 1,200 candle-power each, and to inquire into the cost of maintaining the same.

Jacksonville, Fla.—T. J. Appleyard, secretary of the Senate, who is interested in the Jacksonville and Tampa Bay Improved Railway Company, has been invited to meet his associates in Cincinnati to arrange plans for the construction of the road. It is to be operated by electricity.

Buffalo, N. Y.—Mayor Jewett has given his consent to the project of Alonzo C. Mather to put up an experimental plant of his invention to develop electric power from a system of turbines in the Niagara River. The Legislature granted Mr. Mather this privilege at its last session.

Brooklyn, N. Y.—A route for an electric railway to connect Brooklyn with Far Rockaway has been surveyed and the directors have decided to go ahead with the work of buying the right of way. The road will be a one-track one in which the Boynton bicycle car with several improvements will be run.

Montgomery, Ala.—Judge Arrington of the city court has rendered a decree ordering the foreclosure of the mortgage on the West End and Riverside Electric Street Railway Company in favor of the State Trust Company of New York, which is trustee for most of the $100,000 bonds.

St. Louis.—The work of surveying the proposed route for the electric railway from Carondelet through St. Louis County to Morse's Mills, in Jefferson County, a distance of 40 miles, has begun. It is to be an extension of the Southern Electric, and will be known as the St. Louis and Fenton Railway Company.

Los Angeles, Cal.—A new electric light plant is proposed for the city hall and jail. About 500 lights are necessary.—The Board of Works recommends that the city clerk advertise an ordinance for the construction and operation of an electric road running from Eighth to Hill, to Sixteenth, to Figueroa streets.

Youngstown, O.—Harold & Co., of Pittsburg, have been awarded the contract for an electric road between Youngstown and Lauterman's Falls. Grant Hamilton and Henry Hamilton are arranging to build an electric railway from Youngstown to Poland, O., and through the coal fields of North Lima.

Peoria, Ill.—J. Frank Aldrich has asked the city council for a thirty-year franchise for electric lighting. The Peoria General Electric Company, now supplying the city with light, has been conducting its business since the expiration of the Jenney Electric Light and Power Company's franchise, without any tangible authority from the city.

Mauch Chunk, Pa.—The Inter County Electric Railway Company, which built six or seven miles of track without having properly secured the right of way, has gone into the hands of a receiver, and the court has ordered a sale of the property and franchise of the company at Tamaqua on the 18th inst.

Niagara Falls.—At a recent meeting of the directors of the Niagara Falls Power Company the following officers were elected: President and chief-engineer, D. Coleman Sellers; first vice-president, Benjamin Flagler; second vice-president, Charles Sweet; treasurer, Edmund S. Wheeler; secretary, J. S. Milner.

Rochester, N. Y.—The Rochester Trust and Safe Deposit Company has commenced action to foreclose the $60,000 first mortgage bonds on the Glen Haven Railroad. The attempt at the reorganization of the road by the holders of the second mortgage bonds was a failure, and no effort will probably be made to resist the present action.

Milwaukee, Wis.—The election for officers of the Milwaukee and Waukesha Railroad Company resulted as follows: President, J. W. Bingham; vice-president, C. Pittelkow; treasurer, Jacob Wellauer; secretary, A. B. Myers. The directors are the above-named officers and James Petley, Max Rosenthal, S. I. Henderson, A. Schneider and J. J. Considine, the latter two being from Waukesha.

Beatrice, Neb.—The property of the Beatrice Rapid Transit and Power Company, consisting of the electric light plant, six miles of motor line in operation, etc., all appraised at $37,000, is to be sold at public auction by order of the U. S. Circuit Court, on July 8, in this city. Pending the action of the court the property has been controlled and operated by M. C Steele as receiver, and has earned sufficient to pay all running expenses.

Quebec, Can.—Mayor Parent declined to entertain the protest of a delegation of carriage-makers, blacksmiths and hackmen of this city against the construction of the proposed electric railway; they objected that it would ruin their business. The mayor pointed out that the ancient capital had already suffered enough through its reputation for backwardness, and that it was time to take a new departure in the right direction.

Forestville, Conn.—The Liberty Light Company has bought the Laporte-Hubbell shop in this place and will manufacture the electric light head cap invented by E. D. Rockwell. This is a cap with an electric light on it which is run by batteries carried in the wearer's pocket. With Mr. Rockwell will be associated Mr. Rodrigues, of New York, who will look after the electrical department, and C. A. Treadwell, who will have charge of the machine shop.

Keokuk, Iowa.—The council has been authorized by a vote of the people to establish a municipal electric lighting plant in this city and to make a contract with the Des Moines Rapid Power Company to aid in the development of the great natural water power of the Mississippi at this point. By this contract the power company must develop within a year not less than 15,000 electrical horse power. The probable capacity of the plant will be double that figure. The lowest estimate for the cost of developing this power is $500,000.

Charleston, S. C.—There seems to be no doubt now that this city is to have an electric railway system, as the $5,000 forfeit has been deposited by the men who have been negotiating for the purchase of the City Railway with the intention of changing its motive power to electricity. The men named in connection with the purchase are John B. Hoelgen and Edgar C. Maxham, of Brooklyn, N. Y. The property will be transferrred to the new owners about the middle of July.

Newark, N. J.—The People's Light and Power Company has purchased a controlling interest in the Newark Electric Light and Power Company, and intends to engage in the electric lighting business throughout the State by transmitting current from a great central plant which will be established probably in this city. The authorized capital of the People's Company is $2,000,000.—The first trolley-car from Newark to Elizabeth and over the track of the Consolidated Traction Company in Elizabeth was run on the 3d inst.

Brazil, Ind.—The Brazil Block Coal Company have placed the Jeffreys electric mining machines in their No. 1 mine. They have purchased a dynamo, and besides mining coal by electricity will illuminate the entire mine in this manner. It is presumed that one of these machines, operated by two men, will mine thirty-five tons of coal a day, which would represent the work of twelve skilled miners by the old process. It is the company's intention, should this experiment prove successful, to replace pick mining in all their mines with electric machines.

Little Rock, Ark.—Judge Williams, of the Federal Court, has confirmed the sale of the Capital and City Electric Street Railways to Henry C. Haarstick, of St. Louis, who is trustee. The sale took place last month; $630,000 was the purchase price. The syndicate for which Mr. Haarstick acted in the matter is said to be composed principally of the United Electric Securities Company of Boston and the General Electric Company of New York, and some other capitalists. A new company has been organized to operate the roads under the name of the Little Rock Traction and Electric Company.

Pittsburg, Pa—The Braddock Street Electric Company expects to have its line in operation early in August after a suspension of several years.—The Coraopolis, Sewickley and Economy Electric Road has been organized and will at once start to build a road to Beaver. The officers of the new road are as follows: C. I. McDonald, of Pittsburg, president; Simon Harold, Beaver Falls, vice-president; Geo. A. Lashell, secretary; W. T. Treadway, solicitor; C. I. McDonald, J. C. Whitla, Simon Harrold, John S. Duss, J. A. Ferguson, George A. Lashell and J. W. Arras, directors. The capital stock is $150,000.

San Francisco, Cal.—An electric belt railway system is being urged by leading men of Sonoma and Napa, by which those valleys would be brought within easy reach of San Francisco. Starting at Santa Rosa an electric line will run down the two valleys—one going by Petaluma and Lakeville to the mouth of Petaluma Creek, the other running down Sonoma avenue to Kenwood, Glen Ellen, Sonoma and Shellville. At the latter point the road will connect with an electric road from Calistoga, St. Helena and Napa; thence running along the foothills to a junction with the Santa Rosa and Petaluma electric road, and so on to the mouth of Petaluma creek, to connect with the fast ferry service from San Francisco.

Camden, N. J.—The Pennsylvania Railroad officials have been prosecuting investigations along their lines centering in Camden, looking for the possible equipment of some of them with electricity.—An experimental run on the new electric road built by the Pennsylvania Railroad Company between Mount Holly and Burlington was made last week and the results attained were highly satisfactory to the president and other officials of the company. With the machinery new the trial run lacked some of the elements necessary for furnishing reliable data, but sufficient is gleaned to show that the days of steam on railroads are looked upon as numbered. The road is finished for five of the seven miles between the two cities.

Baltimore, Md.—Gen. Joseph B. Seth, Chas. Dorsey and Dr. J. C. Monmonnier, as a committee of the recently incorporated Gwynn's Falls Electric Railway Co., will make an examination of the various routes suggested for the line between Wetheredsville, Powhatan and Baltimore, and report the one best adapted. The directors of the company have decided that the proposed bicycle system would not be practicable and a regular trolley line will be constructed.—Sealed proposals will be received by the "Construction Committee of the Underground System of the Police and Fire-Alarm Telegraph and Police Patrol" until 12 o'clock noon Thursday, June 20, 1895, for the construction of about 45,000 feet of electrical subway conduits, in accordance with drawings and specifications prepared by the engineer, Nicholas S. Hull, Jr., 508 Equitable Building, Baltimore.

New York.—For the proposed underground railway systems for rapid transit in this city Chief Engineer William B. Parsons has suggested to the Rapid Transit Commissioners the running of trains of not more than three light, roomy cars, running at half minute intervals, with stations at about every four blocks for general service, and for express trains he recommends trains of five or six cars, stopping not oftener than once every mile and a half, the motive power to be electricity. The electrical system suggested is the use of electric motors placed under the regular cars, these being at the head of each train, in the same manner as that employed by the Intramural Railway at Chicago, the Liverpool overhead road and the West Side elevated system in Chicago.—The Kings, Queens and Suffolk Company, 106 and 108 Fulton street, New York, organized to build the new electric railroad on Long Island, calls attention of contractors to the enterprise and requests those who may be interested or would like information concerning it to apply at the company's office for particulars necessary to a thorough understanding of the contemplated work preparatory to the making of bids.—The Edison Electric Illuminating Company of New York has mortgaged to the State Trust Company as trustee all its property rights and franchises for a period of 100 years in the sum of $15,000,000.

Telephone and Telegraph.

B. M. Wilson, of Dawson, Ga., has begun the erection of a telephone system in Union Springs, Ala.

Manager George Durant of the Bell Telephone Company at St. Louis says the company is going to improve its system there at once and will replace the old instruments with telephones used on the metallic wire system.

The Hudson River Telephone Company and the Capital District Telegraph Company, at Albany, N. Y., are to consolidate.

The Telephone and Electric Specialty Company, Memphis, Tenn., doing a general electric business in the Southern States, has recently completed several large telephone installations. Exchanges have been established at Jonesboro and Arkadelphia, Ark.; Water Valley, Miss., and Tallahassee, Fla., all of which are in successful operation. The patrons are highly pleased with the new service as are also those for whom this company has installed a large number of private telephone lines.

The St. Louis Telephone Company, which has asked for a franchise for a single wire telephone system, promises strong competition for the Bell Telephone Company in St. Louis. The new company was organized early in April and has among its stockholders J. A. J. Schultz of the Schultz Belting Company, August H. Busch and E. W. Stamm of the Anheuser-Busch Brewing Association, Moses Greenwood, Jr., Col. Jos. M. O'Shea, Andrew Haley, Thos. J. Ward, Chas. F. Joy, T. J. Hennessy, Clark H. Sampson, Selden Spencer and others. The ordinance granting the new company the right to lay conduits underground has passed a second reading in the council.

The Southwestern Telegraph and Telephone Company at Austin, Tex., has completed its system to Waco, Corsicana, Fort Worth, Dallas, Sherman, Denison, Paris and other north Texas points.

If the Lansing Telephone Company can get a franchise a new telephone exchange will be in operation at the capital of Michigan shortly after July 1. D. A. Reynolds is at the head of the enterprise and has contracts for 310 telephones.

The Railway Telegraphers at their late convention did not decide the question of a location for the headquarters of the organization, but referred the matter to W. V. Powell, the grand chief; J. R. T. Austin, the grand secretary, and the executive committee of the order. This is presumed to be a favorable disposition of the matter for Peoria, Ill.

The common council of Binghamton, N. Y., has received the committee report favoring the granting of a telephone franchise to C. F. Hotchkiss provided he accepts the conditions.

The Oshkosh Northwestern Telephone Company, capitalized at $20,000, is going to put in an exchange at Oshkosh, Wis., without reference to the Berliner decision. J. H. Jenkins and Chas. Schriber are leading stockholders.

V. J. Mayo, an electrical engineer from New York, has arrived in Sacramento, Cal., whither he went for the purpose of putting into operation the works of the Columbia Telephone Company, recently formed by citizens. The engineer says that Sacramento will have complete metallic circuit 'phones which will insure the very best service.

C. J. Willow, the president of the recently organized Wizard Telephone Company at Council Bluffs, Iowa, has got himself into trouble by purchasing material on promises that he could not fulfil. He is now in jail, has tendered his resignation and releases all his interests to Eli Brown, who will pay off all attachments, and put the company on its feet. Whether the company will continue operations yet remains to be seen.

The Schuylkill Telephone Company of Ashland, Pa., has been granted a charter. Its capital is $25,000.

A dispatch from Mitchell, S. D., says: "The largest local telephone enterprise now under consideration in South Dakota is for a line from here to Sioux City. A company has been organized to construct a line connecting Mitchell with Sioux Falls and Sioux City, Iowa, together with all points en route. The right of way will be secured at once and the construction begun on the first telephone line of any importance in South Dakota. Should the investment prove successful, the line will be extended through to the Black Hills. The instruments to be used are of the latest long distance pattern."

The Plymouth Rock Telephone Company (capital $75,000) of Plymouth, Massachusetts, has secured a franchise covering Plymouth, Middleboro, Eddyville, Kingston, Carver, North Carver, South Carver, Rock, South Middleboro and North Middleboro. The company will start in with 523 subscribers at $24 per year for places of business, $18 per year for residences and $12 per year on three party line contracts. Mr. John Boyle O'Brien, attorney, 53 State street, Boston, promoted the enterprise.

A universal cipher code for use in cable messages has just been completed by experts at Berne, Switzerland, who have labored nearly five years on its compilation. The work was authorized by the Paris Convention of telegraphers in 1890. The new code comprises 250,000 words distinctly different from each other and none containing more than ten letters. It will be adopted by all European countries as soon as arrangements are completed for its use, and in a few years will probably become the cable language of the entire world.

The Delaware Telephone Company has been organized at Wilmington. Capital stock, $100,000. Directors: J. Wilson Gooch, Anson A. Maher, Mark M. Cleaver and others.

The Central New York Telephone Company is having subways laid in Utica for its wires. Engineer Wyman of Boston has charge of the work.

Burlington, Iowa, promises to be as great a center for telephone as it is for telegraph lines. The *Hawk-Eye* predicts that "before the year expires Burlingtonians can talk with Chicagoans and New Yorkers in their native jungles."

A new telephone company is being organized at Melrose, Mass., and it has asked the selectmen for permission to erect poles and string wires through the town. It agrees, if it can obtain 100 subscribers, to establish a local exchange, and will cut the prices to about half the present rates. A number of business men are interested in the new company.

Alexander T. Brown, of Syracuse, N. Y., has received letters patent on a new system of electrical exchanges for telephone and telegraph service. Telephone subscribers, instead of calling up the central office, may by this system call each other direct.

Some late telephone devices patented by Daniel Drawbaugh will be controlled by C. W. Ream, of Reading, Pa., and G. Milton Bair, of Hanover, who, if sufficient inducement is offered, intend to establish a large telephone factory at Reading. There is to be a capitalization of $1,000,000, under the name of "The Drawbaugh Telephone and Electrical Company."

Aberdeen, Miss., will soon be supplied with a telephone system by the Aberdeen Telephone Company. Hugh Campbell, superintendent of the Hope Compress, is the owner of the system. He has secured a franchise from the town for a period of twenty-five years.

The construction of the Interstate Telephone Company's line in Frederick City, Md., is being rapidly completed. The exchange will soon be in working order. Long-distance telephones will be placed at the service of the business houses. The company are extending their lines to many cities of the South.

The Home Telephone Company of Baltimore has closed contracts with 3,2[illegible]0 subscribers in that city. The Chesapeake and Potomac Telephone Company, the local Bell concern, has less than 2,400 subscribers, and has charged $125 per year. The new company is making three-year contracts at $36 and $48 per year.

The Erie County Pharmaceutical Association at a recent meeting in Buffalo, N. Y., adopted the following resolution: "That this association go on record as favoring the new Automatic Telephone Company and also urge its members to subscribe for their service."

The Hogan National Telephone Company, of Chicago, has submitted a proposition to business men of Spring Valley, Minn., that if 50 subscribers can be obtained and a franchise is granted it will put in a system.

The Topeka Telephone and Electrical Company, successors to the Harrison Telephone Company at Topeka, Kan., has filed its charter. The capital stock is increased from $25,000 to $100,000 and the directors of the new organization are as follows: A. K. Rodgers, S. J. Bear, C. E. Tomlinson, A. P. Jetmore, E. H. Crosby and Simon Greenspan. The new company starts out with a bona fide list of over 400 telephones now in active operation and has orders for over 150 more which will be put in during the next thirty days. It is organized as a Topeka company and the capital stock is all owned in that city.

COMMERCIAL PARAGRAPHS.

The Cincinnati Edison Company have just placed an order for four more 80-light Standard arc dynamos and Standard lamps. After the severe tests given the thirty-two 50-light Standard arc machines previously purchased, and the remarkable record made by the machines in the matter of no repairs to speak of, it must certainly be gratifying to the Standard Electric Company to receive so plain a proof of the advisability of using only Standard apparatus.

The C. W. Hunt Company, 45 Broadway, N. Y., has issued a booklet on "Industrial Railways" which every street railway and electric light manager needs to have on his desk.

BUSINESS HINTS.

Public Buildings, Theaters, Residences, &c., Proposed or in Course of Construction.

[The following summary is prepared weekly for ELECTRICITY for the information of advertisers and readers who are dealers in apparatus and articles required in the electrical equipment of public and private buildings.]

Atlantic City, N. J.—An ordinance introduced in council providing for city hall to cost not over $100,000.

Atchison, Kan.—Plans preparing for a court house.

Dover, Del.—Architect Frank R. Carswell has been engaged to make plans for a new State Library to be erected here.

Erie, Pa.—The new Schlosser block is to contain a public hall.

Leadville, Col.—A residence to cost $100,000, by John F. Campion of the gold mine "Little Johnnie."

Malden, Mass.—Y. M. C. A. building, cornerstone laid. Information of ex-Alderman Jesse Cadworth.

New Castle, Pa.—Architect Cyrus T. Dean, Erie, Pa., is preparing plans for a theater to be built here at a cost of $40,000.

New York City.—Ten story building for offices and lofts at 11 West 28th st., Architects Barrey and Chapman.—Flats and Apartments: 7 five story, 7th ave. between 146th and 147th sts., Architect G. A. Schellenger, 120 Broadway; 6 five story, 114th st. west of 8th ave., Architects A. B. Ogden & Son, 1031 Madison ave; seven story, south side of 34th st., west of Lexington ave., Architects Hogan, Slattery & Co., 105th st. and West End ave.; 4 five story, northwest cor. Madison ave. and 101st st., Architect John C. Burne, 201 East 86th st.; 4 five story, north side of 84th st., east of Amsterdam ave., Architect John De Hart; 4 four story, north side of 148th st., east of Bergen ave., Architects Neville & Bagge; 4 five story, south side of 63d st., east of 11th ave., Architect Frederick H. Kurtz; six story flat, southeast cor. of Stanton and Willett sts., by Fay & Stacom, 387 Pleasant ave.; five story, cor. Water and Scammell sts., by Joseph Fisher, 26 Scammell st.; five story, 80th st., east of Amsterdam ave., by Adler & Co.; six story, north side of 11th st., by John B. Cole, of the Hotel Majestic; 5 five story, north side of 112th st., west of Amsterdam ave.; 4 five story, Amsterdam ave and 108th st., by Judson S. Todd, 28 East 28th st.; 2 five story, 329 West 53d st., by Fisher & Peck, 66 East 66th st.; 2 seven story, northeast cor. Madison ave. and 87th st., Architect Thos. Graham, 309 East 43d st.; five story, 852 1st ave., Architect Thos. Graham; five story, east side of 3d ave., north of Grove st., Architect Henry Anderson; five story, northeast cor. Amsterdam ave. and 123d st., Architect W. J. Fryer; 5 five story, south side of 112th st., east of 5th ave., Architects Neville & Bagge, 227 West 127th st.; 4 four story, 108th st., east of Bergen ave., by Elizabeth M. Barry, 1669 Boston ave.; four story, 170th st. and Vanderbilt ave., by Thomas Faning; 4 three story, 119th st., west of Lenox ave., by Wm. H Jacob, 16 East 43d st.; 3 five story and basement, north side of 83d st., west of Lexington ave., by F. L. Kurtz; seven story flat, southeast cor. of 5th ave. and 118th st., also 2 five story south side of 118th st. and 5th ave., by Byrdie M. Spence, 442 Central Park West; 2 five story, south side of 65th st., west of Central Park, by Mary M. Stewart, 131 Columbus ave.; four story, south side of 151st st., west of Cortland ave., by Henry Ewald, East 151st st.; five story and basement, south side of 75th st., east of Park ave., by Henry O. Havemeyer, of Greenwich, Conn.; seven story, west side of Amsterdam ave., south of 103d st., by Henry G. Marshall, 101 West 81st st.; 4 five story, 286 Willis ave., by G. S. and H. S. Boehm; 3 five story, north side of 80th st., west of Columbus ave., by Wm. Drought; 4 five story and basement, south side of 63d st., west of 11th ave., by James D. Putnam; ten story and basement, at 75th st. and Columbus ave., by C. H. Merriman, of Oakdale Station, Long Island; five story, southwest cor. Madison ave. and 118th st., by Schreiver & Fennell 110 West 131st st.; seven story, northwest cor. 69th st. and Central Park West, Architect George Keister, 1286 Broadway; 14 five story, north side 2d ave., east of Ave. A, by Timothy Donovan, 322 West 40th st.—The Pierrepont residence at 103 5th ave., has been sold by Jacob Hirsch to a builder, who will erect a high office building on the site.

Pittsburg, Pa.—Architects Barthberger & Guss have prepared plans for a club house to be erected in Oakmont Square.—John C. Holmes has had plans prepared for a high-class residence on Braddock Terrace.—A five story annex to the structure occupied by Cruikshank Bros. & Co., to be equipped with suitable machinery.

Quincy, Mass—New court house for the County of Norfolk, to cost $70,000.

Richmond, Va.—Plans have been drawn by Capt. M. J. Dimmick for a building for the R. E. Lee Camp Confederate Veterans, to be heated by steam and lighted by gas and electricity.

St. Paul, Minn.—Plans have been prepared for the Senate Lodge, to contain lodge room, bowling alley, gymnasium, billiard room, hall, etc.; building committee: E. L. Tryer, R. C. Hine, R. B. Ware.

Titusville, Pa.—State Hospital for the insane.

Washington, D. C.—The Senate Committee on Rules has been called to meet for the purpose of considering various questions affecting the Senate, the most important of which are the proper ventilation of the Senate Chamber and the lighting of the Senate wing of the Capitol.

INCORPORATIONS.

The Batesville and Oldenburg Railroad and Electric Company, Batesville, Ind. Capital stock, $50,000. Promoters: Kendal M. Hord, Bellamy S. Sitton, Ed. K. Adams, Jonas Joseph, Shelbyville, Ind.; John Hilderbrand, Batesville.

The Battle Mountain Heat, Light and Power Company, Victor, Col.—to manufacture and furnish gas and electric light to town of Victor and vicinity. Capital stock, $500,000. Promoters: James F. Burns, James Doyle, F. M. Reardon, J. B. Cunningham, Victor, Col.

The Negley Street Railway Company, Pittsburg, Pa.—to build an electric street railway in the City of Pittsburg. Capital stock, $6,000. Promoters: W. B. Rhodes and Joshua Rhodes, Allegheny; Wm. H. Latshaw, Pittsburg.

The Gross Street Railway Company, Pittsburg, Pa.—to build an electric street railway in the City of Pittsburg. Capital stock, $6,000 Promoters: W. B. Rhodes and Joshua Rhodes, Allegheny; Wm. H. Latshaw, Pittsburg.

The Milwaukee Electric Manufacturing Company, Milwaukee, Wis.—to manufacture and deal in electrical supplies and machinery. Capital stock, $8,000. Promoters: J. E. McKivitt, M. Weisser, J. C. Schmitt, Milwaukee.

The Ives Land Company, Seattle, Wash.—to plat lands and town sites and deal in same; operate railways, water works, electric and gas works, mills, etc. Capital stock, $40,000. Promoters: A. H. Gamel, W. G. Tanner, J. G. McFee, E. F. Sweeney, H. C. Henry.

The Oakley and Cincinnati Street Railroad Company, Cincinnati, Ohio—to construct, maintain and operate a street railroad line from Oakley into Cincinnati. Capital stock, $10,000. Promoters: R. J. H. Archiable, John Rempe, H. P. Sabbert, Edwin E. Schneider.

The Canales Trolley Company, Springfield, Ill.—to obtain from Frank Wm. Canales, of Portland, all the patent rights for the United States for trolleys and all improvements thereof; own, manufacture, buy and operate inventions relating to trolleys and all machinery. Capital stock, $100,000. Promoters: Adam M. Ross, Frank W. Canales, T. Henry Pearse.

The Globe Electrical Company, Detroit, Mich.—to manufacture and sell electric dynamos, motors, etc. Capital stock, $10,000. Promoters: Will H. Palmer, Scott H. Morris, Friend Palmer, Detroit.

The Charleston Electric Company, Charleston, Ill.—to manufacture and deal in telephone, light, heat and power and street railway apparatus and supplies, and construct light, heat and power plants. Capital stock, $5,000. Promoters: Richard Cadle, Frank C. Brooks, Wm. A. Highland.

The Dallas City Street Railway Company, Dallas, Tex.—to construct and maintain street railways in Dallas to be operated either by horse, electric or cable power. Capital stock, $500,000. Promoters: Frank Clark, Baltimore, Md.; G. L. Blackford, Denison, Tex.; J. L. Sale, Dallas, Tex

The Phœnix City Railway Company, Phœnix City, Ala. Capital stock, $30,000. Directors: J. F. Flourney, J. Wainright, L. F. Garrard, H. F. Effing and others.

The West End Electric Light and Power Company, West Hazleton, Pa. Capital stock, $10,000.

The East Lorain Street Railroad Company, Lorain, Ohio—to construct, own and operate street railroads in village and county of Lorain, and in Cuyahoga County, electricity or other motive power to be used in operation; to supply electric light, heat and power. Capital stock, $25,000. Promoters: William J. Garone, Wm. McReynolds, John W. McReynolds, John A. Park, Lorain; Edward S. Meyer, Cleveland, O.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JUNE 4, 1895.

ELECTRIC RAILROADS AND APPLIANCES.

540,305. Closed-Conduit Electric Railway. Michael F. Flynn, Stamford, Conn. Filed July 28, 1894.

540,340. Trolley-Pole With Locking-Wheels. Thomas Thompson, Newark, N. J. Filed Oct. 29, 1894.

540,486. Trolley for Electric Railways. Theophile Euphrat, Darien, Conn. Filed March 5, 1895.

540,487. Ice-Detaching Trolley for Electric Railways. Theophile Euphrat, Darien, Conn. Filed March 22, 1895.

540,569. Conduit Electric-Railway System. Charles M. Allen, San Francisco, Cal. Filed Oct. 3, 1894.

ELECTRIC LIGHTS AND APPLIANCES.

540,333. Electric-Arc Lamp and Carbon. Charles A. Pfluger, Chicago, Ill., assignor to the Standard Electric Company, same place. Filed Oct. 13, 1894.

540,404. Electric-Arc Lamp. Henry Radcliffe, Milwaukee, Wis., assignor of three-fourths to Thomas K. Creighton and John C. Sundin, same place. Filed March 19, 1895.

DYNAMO ELECTRIC MACHINERY.

540,351. Dynamo-Electric Machine. George De Camp, St. Louis, Mo., assignor to the Atwood Electric Company, same place. Filed Sept. 24, 1894.

540,456. Electric Motor. Frederick Pearce, New York, N. Y. Filed Dec. 3, 1890.

TELEPHONE AND TELEGRAPH APPARATUS.

540,239. Telephone System. William W. Dean, St. Louis, Mo., assignor to the Bell Telephone Company of Missouri, same place. Filed Feb. 21, 1895.

540,477. Telegraphy. Cyprien R. J. Willot, Paris, France. Filed April 24, 1894.

MISCELLANEOUS.

540,244. Electric Heater. Edward E. Gold, New York, N. Y. Filed Jan. 29, 1895.

540,323. Electromagnetic Winding. Osborn P. Loomis, Bound Brook, N. J., and Charles A. Pierce, Lynn, Mass. Filed March 9, 1895.

540,325. Electric Trolley for Canal-Boats. Alonzo C. Mather, Chicago, Ill. Filed Dec. 1, 1893. Renewed May 3, 1895.

540,341. Electric Burglar-Alarm. James Tomney, New York, N. Y. Filed May 2, 1892.

540,358. Electric Switch. John O. Heinze, Jr., Lynn, Mass. Filed Dec. 4, 1894.

540,366. Can-Heading Machine. Henry Schaake, San Francisco, Cal. Filed April 24, 1894.

540,398. Electric Heater. John E. Meek, Denver, Col., assignor to the H. W. Johns Manufacturing Company, New York, N. Y. Filed Feb. 5, 1894.

540,422. Signal-Transmitting Apparatus and System. Henry A. Chase, Boston, Mass., assignor by mesne assignments, to the Metropolitan Duplex Fire and Police Signal Company, Portland, Me. Filed Sept. 1 1892.

540,463. Electric Gas-Lighter. George W. Shepherd, Philadelphia, Pa. Filed March 13, 1895.

540,480. Apparatus for Use with Electrically-Illuminated Signs or Advertisements. Ernest L. Berry and Frederick Harrison, London, England. Filed Nov. 21, 1894.

540,529. Electrically-Controlled Speaking-Tube. George S. Williamson, McKeesport, Pa. Filed Feb. 18, 1895.

540,540. Underground Electrical Conductor and Method of Manufacturing Same. John H. Croskey and Joseph Locke, Pittsburg, Pa. Filed Jan. 17, 1895.

540,557. Electric Regulator. James McKim, Weir, Kans. Filed Sept. 12, 1892.

540,606. Apparatus for Electrically Purifying Water. George M. Collier and Richard T. Detlefs, Cleveland, Ohio. Filed Nov. 10, 1894.

RE-ISSUE.

11,498. Electrical Signaling System. Bradley A. Fiske, U. S. Navy. Filed Feb. 16, 1895. Original No. 527,958, dated Oct. 23, 1894.

ELECTRICITY.

VOL. VIII. NEW YORK, JUNE 19, 1895. No. 23

ELECTRICITY

Published every Wednesday by the

ELECTRICITY NEWSPAPER CO.

B. E. GREENE, PRES'T. L. J. MONTGOMERY, SEC'Y.

PUBLICATION OFFICE:

6 Park Place - New York

EDITORS: NELSON W. PERRY.
BURTON E. GREENE.
R. H. WILLOUGHBY.

BUSINESS MANAGER, - - JOHN L. GANS.

SUBSCRIPTION RATES:

UNITED STATES,	$2.50
IN CLUBS OF FIVE OR MORE,	$2.00
FOREIGN COUNTRIES,	$4.50
SINGLE COPIES,	10 CENTS

ADVERTISING RATES:

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.

Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

ENTERED AT THE N. Y. POST OFFICE AS MAIL MATTER OF THE SECOND-CLASS.

There are still left in this trade a large number of men who have entered into it for their life work. They may be disheartened, but they have not given up. It is for them that we write. To them we present our argument, and to them we must all look for the re-establishment of business principles, the reinforcement of the doctrines of common sense.

It is for these men to consider just why wrong has temporarily triumphed over right, why it was possible for the tricksters and adventurers to bring the industry to its present condition.

And when these questions receive careful thought the only answer possible is that the electrical press has not done its duty.

If the "Electrical Engineer," the "Electrical World," the "Electrical Review" and the "Western Electrician" had faithfully done their duty by the trade they claim to represent, whose best interests they claim to guard, the present situation would never have confronted us.—"ELECTRICITY," June 5, 1895.

EDITORIAL NOTES.

The Duty and Responsibility of a Trade Paper.

In our issue of June 5 we endeavored to awaken some of our contemporaries to a sense of their duty to the trade at large, and to stir the consciences of some of their managers and editors by reminding them of their responsibility to the general public. We hoped by calling attention in a somewhat forcible manner to their failure to do their duty to the very large number of independent concerns counted among their advertising clients, and also by pointing out that they, recognized as mediums for the circulation of reliable electrical news among the general public, had never uttered a word of caution, or even remotely suggested that much of the electrical business of the country was in the hands of a class of people not only utterly indifferent to the true interests of the investor, but actually engaged in deliberately fleecing investors on a scale the like of which has never been equalled in the history of the world.

When the present management of ELECTRICITY first entered the field of electrical journalism, three years ago, we were led to believe that the electrical industry of this country rested upon an adamantine foundation, and that those companies which were fortunate enough to have at their disposal the inventive genius, constructive ability and high technical knowledge needed to invent and develop the machinery, apparatus and appliances used in the industry, and possessed of sufficient capital to carry on its manufacture on the scale demanded in the new and rapidly developing art, were indeed to be envied, because had the business management been such as to have properly protected the investors in the stocks of the corporations engaged in the business, the legitimate returns from the business would have been greater than in any other business that we know of.

We confess that when we first entered the field of electrical journalism we had no special training or previous experience fitting us specially to speak authoritatively on the many complex questions met with in the development of the machinery and apparatus used in the art, but in this respect we believe we can safely lay claim to having been on a par with any of our contemporaries when they first entered the same field, which was but a few years before the date of our entry.

Our interest, however, had long before been raised, and our imagination and expectations been excited to pretty much the same pitch as that of the general public by the novelty and utility of the results achieved by the electric light and power transmission branches of the business, and the many sensational stories which had appeared from time to time in the technical and daily press concerning the future possible developments of the art had borne our hopes and expectations upward to a very great extent, but not beyond that which we felt was already justified by the apparently successful and important work and the results already achieved.

The future seemed indeed most bright and promising, and no matter how sanguine our hopes may have been, it nevertheless seemed incredible that they could exceed the bounds of the possible, and it seemed almost foolhardy for anyone to fix any limits to the development of the useful and beneficial applications of that truly wonderful and most mysterious power, Electricity.

With closer contact with the electrical field, however, we began to hear rumors of a kind which seriously disturbed the roseate views we shared in common with most of the public. These rumors were so startling and discordant that at first we were disposed to credit them to that class of persons who might properly be called pessimists and cranks, and to believe that the ideas embodied in the rumors were the product of diseased imaginations or disordered stomachs, and at first we were disposed to pay but little attention to them.

Constant and widening contact with the trade, however, gradually convinced us that there was much of truth in these rumors, and as our knowledge of the trade increased we were reluctantly compelled to believe that the worst rumors we had heard were nothing but slight reverberations from the outer boundaries of a field the interior of which was carefully concealed from the public view, but which little by little was exposed to our vision. The glimpses we first caught of this interior were of a kind which raised in us a feeling of discouragement and disgust, but closer study of the situation induced us to still more thoroughly explore this carefully concealed region, known only to and fully understood by comparatively few people, but which certainly should and must have been understood by our older contemporaries, whether their journalistic methods were infantile or archaic. With the knowledge accumulated during our investigations there was developed in us a strong spirit of revolt against the barefaced rascality discovered, and we became thoroughly convinced that we could not be true to ourselves, honest to the trade or to the general public, by pretending not to perceive the forces acting to bring the industry to ruin and disgrace.

We believe that we now fully understand the condition of the electrical trade as it exists in this country to-day, and moreover we have at present such a complete knowledge of the history of the art and of the doings of the managers of the various corporations formerly and now engaged in it as to fully qualify us to deal with the subject in an authoritative manner, and to entitle our opinions in the matter to the consideration and respect of the trade and the general public.

It was this complete knowledge of the history of the art and the doings of the managers of the corporations engaged in it that led us to clearly comprehend the fact that the solid foundation upon which we had at first supposed the industry to rest did not exist at all, and to perceive that in place thereof there did exist a condition of affairs most sad to behold and fraught with the greatest danger to the best interests of the trade and of the public; and we believe that our contemporaries had sufficient knowledge of the matter to enable them to see the situation from the same standpoint as we did. Instead of a solid industry resting upon a sure foundation, we found a most unstable one, the foundations of which were honeycombed in every direction by fraud, misrepresentation and mismanagement.

And an industry which should have been a benefit and a blessing to the country, and a source of immense profit to all those engaged in it and to investors, has been converted into an injury and a curse to nearly all except a few unprincipled people at the head of the affairs of most of the larger corporations engaged in it.

We are not of those who believe that the industry cannot be rescued from its present perilous position, nor are we to be counted among those who believe that by a policy of shutting our eyes to the facts, sealing our mouths against the utterance of the truth for the purposes of temporary gain or profit, these conditions will remedy themselves. Indeed, common honesty demanded that every paper supported by the trade should long ago have vigorously attacked the management of the corporations doing business by the methods too commonly practised in the electrical field, and done all in their power to assist in eradicating the evils existing in it.

Throughout the length and breadth of this land there is abundant evidence almost daily presented to the technical electrical press to give an idea of the immense losses inflicted upon confiding investors in electrical enterprises and convince any reasonable person that the shameful financiering schemes of some of the unprincipled men engaged in this business have been the bane of the trade. For scarcely a day passes but that one or more of the corporations, the stocks and bonds of which have been to a greater or lesser extent foisted upon the investing public, goes into the hands of a receiver, and a reorganization and scaling down of the capital of the wrecked concerns become necessary.

In the columns of this journal during the past three years we have repeatedly in a general way called attention to the financial methods employed by the managers of the Thomson-Houston Company and the General Electric Company, and in our last issue we presented a specific instance, accompanied with documentary proof of the correctness of our charges.

The Milwaukee Street Railway system, which some time ago defaulted in paying the interest upon its bonds, and has recently passed into the hands of a receiver, is another instance. In next week's paper we shall give a list of street railway companies, the stock or bonds, or both, of which are included in the assets of the General Electric Company in its recent annual report, which shows that out of 40 companies financed by the T.-H. method 25 are in the hands of receivers. In view of these facts, can there longer be any doubt about the correctness of our views and opinions as expressed from time to time in the columns of this journal? If so we shall soon present to our readers such an exposé of the rascally financiering methods employed in this business, accompanied by documentary proof, as will convince even the most sceptical of our readers that we are right.

We know that our policy of vigorously attacking and showing up these methods has not been publicly approved by any of our contemporaries; and many engaged in the industry, whose interests *appeared* to be injuriously affected, have not only disapproved of our course, but have roundly abused us and charged us with improper motives, and some few persons have even gone so far as to call us blackmailers. But all this must come to every newspaper that tells the truth.

Reforms are at first generally unpopular, and reformers must be prepared to stand more than ordinary abuse. We did not enter upon this campaign without an appreciation of what it meant in contumely, misrepresentation, abuse and danger to ourselves. We knew that we must sacrifice the support of many engaged in the trade and the aid of some of those writers who have been of material service to our contemporaries like the *Electrical World*, the *Electrical Engineer*, the *Western Electrician*, and in earlier days to the *Electrical Review*.

We think we may justly claim that we have not lacked the courage to express our convictions, and we are sure that our course was justified by the circumstances.

For we believed that even a trade paper owed certain duties to the trade and had responsibilities to the general public which it ought not to shirk for reasons based solely upon temporary gain or sentiment.

But our campaign is not yet finished, and will not be until we have accomplished our purpose.

We reprint elsewhere from our contemporary, the *Electrical Review*, of June 12, some comments on our campaign which need a wider circulation than they can have in that paper.

It seems scarcely credible that any person engaged in the field of electrical journalism, possessing even a modicum of common sense or honor, could descend to such a depth of dishonor and pettifoggery as to pen such lines. But since it has been done we propose to analyze the misstatements made and to expose the attempt to dodge the issues presented in the editorial on page 1 of our issue of June 5.

If any contradiction of the first statement of the *Electrical Review* concerning our flagging of vigor in this campaign is needed, we point to our article on the Tacoma Street Railway swindle in our last issue.

The efforts we have made to regulate the electrical universe, or more truthfully that part of it in the United States, are on record, as are also the results of those efforts, and those who think at all admit that ELECTRICITY has been a stronger force since 1892 than all other electrical journals combined.

We have no lack of appreciation to complain of. On the contrary, ELECTRICITY has constantly grown in strength and influence, is a paying property, and is recognized in this country and in Europe as the representative of all that is best in the trade on this side of the Atlantic.

We did not start out to kill any company. We did start out to kill corrupt and dishonest methods in the management of corporate affairs in our trade, and to assist the honest stockholders in protecting their own rights. We shall succeed fully. The signs are already in evidence.

We are not chagrined to find the G. E Company "growing in strength," but we *are chagrined* to find any newspaper in the world indulging in such reckless untruth as to suggest that this company *is* "growing in strength." According to the G. E. Company's own reports, parts of which the *Review* has printed, a surplus of $9,300,000 on June 1, 1892, has changed into a deficit of $14,300,000 on January 31, 1895, the stock has fallen from 119⅞ to about 33, the preferred stock and bonds are both selling twenty points below their former quotations. Is this growing in strength?

We never aimed to drive any of our contemporaries off the face of the earth. We have use for them all, and will yet compel them to play a part in our campaign for truth and justice. From their decrease in business, however, averaging from 8 to 20 pages, we fear they are driving themselves off the earth by not protecting their own clients.

If the *Review* honestly regrets that the electro-medical frauds still thrive, why does it not make an effort to expose them?

Infantile disappointments are as nothing compared with those of old age. The former, easily forgotten in the brighter and more engaging hopes for the future, may be buried any hour under the realization of noble deeds achieved with advancing strength. But the journal which arrives at its zenith, passes it, declines and is confronted with actual dissolution, with the terrible knowledge that it has not for one single issue been true to its mission, that its death is not an accident but a deserved fate—this journal, we hold, must feel disappointment bitterly.

There is no doubt that Mr. Price and our other contemporaries would miss us, would chortle in their joy if we were gone. But we are not going. Oh, no.

We have no intention of retiring "from a cruel and unappreciative field." From the record of failures in the past three years it looks very much as though the field were "retiring" faster than ELECTRICITY.

As to our "own reform" we do not see how perfection itself can be reformed. Seriously, if there are any specific faults in the policy pursued by this paper, we would esteem it a favor to have them pointed out in detail by any or all of our contemporaries. We welcome criticism even from weak-minded journals like the *Electrical Review*.

It is not at all strange that the *Electrical Review* should be the first to writhe and squirm at the presentation of facts which it cannot deny and which are particularly well understood in its own office, for the *Review* itself has been from the start conducted in almost the same manner as the larger electrical companies. It has been a veritable graveyard for invested capital.

When the paper was first started there were four companies struggling for supremacy, each one of them trying to kill the rest—the Brush, Edison, United States and Weston companies. From these concerns the paper extracted large amounts of money without any equivalent return. The publisher was the intermediary, going from one company to the other and working "deals" for consolidations and for other purposes. His idea was to *get money*, no matter whether it was earned or not. The "entertainment" idea, which was the stock in trade of the electric light boomers from Boston, was worked to its full limit by the publisher of the *Review*, and some of his bills for these extravagancies are yet unpaid. Stock in the enterprise was sold without regard to the chances of the investor for getting any return. Mr. A. J. Dam put $12,000 into it, none of which ever came back. The entire career of the paper has been stained by exactly the same methods, the same peculiar theories of business, which have made the general electrical business what it is to day.

Most of the offences and derelictions charged against the *Review* can be laid with equal justice at the doors of all the other journals. They have never risen to the height demanded of them by the untoward conditions developing even in 1880. They have never tried to educate the public, to give correct information. They have never dared to criticise any concern who had advertising patronage to bestow. Holding out their hands to beg patronage and support from the independent element, they used all the abilities possessed by them, every week, to strengthen those corporations which were endeavoring by every means, honest or dishonest, to drive the legitimate workers out. The only object of these papers has been to draw from the plunderers as large a share of the plunder as possible. Their share of this plunder has been the consideration received for concealing the truth, even for printing directly misleading statements.

We have now heard from one of our contemporaries in "answer" to our strictures upon them for their total lack of honor, the utter absence of any endeavor to do their duty by the trade which gave them birth. We would now like to hear from the rest.

The best answer they can make is not to deny the truth or indulge in vaporings like those of the *Review*, but to mend their ways, and turn in now, though late, to do their duty by their constituents and drive out the rascals and their accursed methods from this trade.

At present these papers are as far from what trade papers ought to be as the poles are from the equator.

* * *

Electrical Transmission of Power.

Under date of May 28th one of our subscribers makes the following inquiry, the answer to which we believe will be of such general interest that we publish the letter in full, omitting only the post office and name of our correspondent:

To the Editor of ELECTRICITY.

Dear Sir: As one of your subscribers I wish to inquire in regard to the transmission of power. We are in negotiation for a water power on the Susquehanna River, six miles distant, as our coal bills up here are excessive. We note in your paper of May 22d, in regard to the Niagara enterprise, that there is a great loss of power in transmission. As we have only six miles to overcome, can you give us an approximation of percentage of loss by the best of the present methods, and much oblige

Yours very respectfully,

B.

As regards the question of whether or not it would pay to transmit power from a distant waterfall to compete with locally generated steam power, the local conditions are so controlling that it is impossible, without knowing them all, to give in any case a categorical answer, even when the distances involved are given as in this case. Water powers as sources of energy for electrical transmission are often held out as enticing investments, and on the assumption that they cost nothing to develop are placed in a false light which has led many to regret their connection with schemes of this kind. On the other hand, well considered projects of this kind offer abundant opportunities for safe and profitable investment, and there are doubtless hundreds of legitimate enterprises of this kind already under way or projected, and it is to these that we point in pride as we do to many others with chagrin.

In the first place, assuming that the water power is ample and constant, it must be borne in mind that the interest on the investment required to develop that power, plus the interest on the transmission plant, plus the cost of maintenance of the water power and transmission plant, must be *less* than the cost of coal required to generate the same power locally. That is to say, the fixed charges on the improvement which renders the water power available stand in lieu of the fuel bill which the new undertaking is intended to replace. This brings into the question the cost of locally generated steam power. It will be perfectly evident that with coal at $2 a ton we could not afford to invest as much money in a water power development as we could if the latter were to compete with coal that cost $10 or $20 per ton. It might easily be that the interest on the cost of developing a water power at our very doors would equal or exceed the cost of steam-generated power at the same place, and this would be so if coal, labor and other local supplies were exceedingly cheap. It would be folly in such a case to go to a distant waterfall unless the cost for development of the latter were so much less than the cost for development of the local water power that with the added cost of transmission the power could still be delivered more cheaply than it could be produced for locally by steam or other means. On the other hand, in localities such as many of our Western mining districts, where coal is very dear, labor high, and where all supplies are hard to get, either on account of the distance from the railroad or difficulties of transportation, a large investment in water power, even at a very great distance, would be fully warranted and pay handsomely. Thus it will appear that mere distance, or mere cost of coal, or mere cost of developing and transmitting the power does not settle the question so often asked.

If locally produced power is cheap, then the transmitted power must be cheaper to compete with it, and this means that the investment required to render the distant source of energy available must be such that the fixed charges will not exceed the cost of coal locally delivered, in lieu of which they stand.

In estimating the fixed charges on a hydraulic plant, great care should be taken not to underestimate them, and it is just here where so many promising enterprises of this kind are wrecked. In a hydraulic plant it is usually necessary to plan on a much larger scale than needed for present requirements. That is to say, if you have a fall capable of developing say 10,000 H. P. and the present demand is only for 1,000 H. P. it is seldom feasible to develop the water power for the smaller amount and then add to it as the market for power increases. The dam required for the smaller demand would cost nearly or quite as much as that required for the full 10,000 H. P., and the result is that an investment is made at once which is nearly or quite adequate to the development of the larger amount. The fixed charges on this investment must be distributed among 1,000 H. P. instead of 10,000 H. P. as usually calculated. When divided among the full capacity of the plant these fixed charges may be very small, and seem to indicate a judicious investment, whereas if divided among one-tenth the amount, or the amount actually used, they may be prohibitive.

Then again, the load factor at the consuming end of the line is an equally important factor often not considered. Supposing the consumer uses the 1,000 H. P. but half or one-third the time, then the fixed charges, which seemed small when divided among the total capacity of the plant, become multiplied again by 2 or 3. These are features of the situation which must all be considered, but which, in embryo undertakings, are most apt to be entirely overlooked or given insufficient weight.

Our correspondent refers to our remarks in a previous issue on the Niagara Falls transmission scheme. This in our opinion forms a most noteworthy illustration of the features above referred to.

In order to get power at all the Niagara engineers felt compelled to dig a long tunnel capable of acting as a raceway for 100,000 H. P. The cost of the tunnel, the wheelpits and other structures already completed has already mounted up into the millions. We have heard it estimated as high as $10,000,000. Suppose it is only half of this, the interest on this investment at 6 per cent. will be $300,000—these are the fixed charges for the *undeveloped* power. Dividing this by the total capacity of the tunnel makes the very reasonable fixed charge per annual H. P. of $3. But the company have not yet sold 25,000 H. P. If they had, then the $3 would become $12. Coal at $2 per ton would be cheaper. Supposing the customer has to pay a fixed charge of $12 per H. P. and is entitled to use it twenty-four hours a day 365 days in the year, but uses it only on an average of 9.6 hours per day, which is better than most of our electric light stations are doing to-day, the fixed charges at once become $30 by reason of a 40 per cent. load factor.

There are two conditions surrounding the Niagara project which are exceedingly unfavorable to its success as a business enterprise. The first is that its product must compete in one of the very cheapest steam power markets in the world, and second, that by the plan of development adopted the investment is so enormous that the fixed charges per H. P. must be exorbitant until the sale of power is large enough to bring it down to reasonable figures.

In regard to our correspondent's last inquiry as to the loss of power in transmission, the reply is that that can be made anything we choose. By simply increasing the electromotive force sufficiently high we may reduce the line losses to a negligible figure. Where very high potentials are involved there will be a saving in copper or in line losses, but there will be some additional charges for insulation against these higher voltages, and if step-up and step-down transformers are used additional losses will be introduced, but in a given case where the voltage is fixed there will be one permissible loss in transmission which will give the best results, and that is determined by the cost of energy produced and the cost of copper. According to Sir William Thompson's law the most economical loss in transmission is that in which the value of the H. P. lost annually is just equal to the interest on the investment in the copper in the line.

We give below the available data of several of the most important American transmission schemes:

Concord.—Two 250 K. W., 3-phase; 2,500 volts step-down transformation to 110 volts; distance of transmission, 4 miles; steam coal at point of delivery, $4.25 to $4.50 per ton.

Sacramento.—Four 750 K. W., 3-phase; 11,000 volts step-up and step-down; distance of transmission, 20 miles; competes with steam coal at $8 per ton.

Redlands.—Two 250 K. W., 3-phase; 2,500 volts step-down to 110 volts; 1st circuit, 4½ miles, 150 K. W.; 2d circuit, 7½ miles, 100 K. W.; competes with coal from Sydney, Australia, costing delivered $8 to $9 per ton.

Telluride.—3,000 volts; transmission, 8 miles; competes with soft lump coal costing in Telluride $10 to $12, hard coal about $2.50 more; no data as to cost of coal delivered at the Virginius mine; longest transmission (Ophir loop to Tomboy mine), about 16 miles; E. M. F. at motor terminals, 3,000 volts; competes with coal at Tomboy mine costing prices quoted above at Telluride plus cost of delivery at mine, which is $10 to $12 additional.

Niagara to Buffalo.—Distance about 20 miles; competes with coal at $1.50 to $2 per ton.

It may be well at this point for us to define distinctly our position in regard to water power electric transmissions, since we have been accused in some quarters of hostility to enterprises of this kind. The electrical industry has been crippled by the repeated failures of dishonest or ill-judged schemes in the past. So called friends of the electrical industry, as well as dishonest schemers, have foisted upon the public so many commercially impossible projects that electrical investments have become generally regarded with suspicion. No class of schemes are more enticing than water power schemes, and none lend themselves to deception so readily as these. The idea that water power costs nothing is the seed from which a harvest is expected, but from which disappointment is sure. It is part of our province to spread an early frost on these budding schemes. On the other hand, there are already many well-planned and successful installations of this kind in operation, and there will be and should be many more if we can ward off the blight which the ill-judged or dishonest schemes, if matured, are sure to bring upon the industry. To all legitimate engineering enterprises of this kind ELECTRICITY will lend its most efficient aid and encouragement. To those which are bound to be failures before they are born, we pledge, in the interests of the industry, our most active opposition.

* * *

IT IS with some regret, but less surprise, we learn that in the recent contest between Paris and Bordeaux for carriages without horses, irrespective of other power used, the electrical carriages were defeated. A gasoline motor won, not only the first prize, but the second, third and fourth, making the distance of 750 miles in 48 hours.

* * *

Cause and Effect. The fact that speculators and schemers, without any praiseworthy intentions as to the building up of a solid industry, have taken all but complete possession of this trade from the beginning is on record. It is an important part of ELECTRICITY's mission to point out just as many of the causes for this condition as possible in order that sooner or later the evil features may be eliminated as fully as possible.

One of the most potent reasons for the success of the schemers has been the lack of knowledge on the part of the public—even the intelligent public—in regard to electrical matters generally; and the prime cause of this ignorance, almost as evident to-day as in 1882, has been the misinformation given out in the daily press, tacitly submitted to if not directly inspired by men of considerable ability and knowledge—conspicuously by Edison himself.

The early New York *Herald* articles, in which it was claimed that Edison had "solved the problem," that "gas was to be driven out," that "a 16 C. P. lamp can be maintained at a cost of not over 16 cents per annum," did almost as much to injure the honest manufacturing industry as Edison's splendid inventive work did to promote it.

The same causes are working to-day. In a recent issue of the New York *Herald* was a half-column article on the work of Mr. D. McFarlan Moore with startling headlines as follows:

TO MAKE LIGHT WITHOUT HEAT.

D. McFarlan Moore Claims to Have Made a Discovery that Will Revolutionize Illumination.

WILL BE SOLD IN STICKS.

These Can Be Carried Around by the Owner, Who Can Press a Button and Get a Light.

JUST LIKE A GLOWWORM.

The same week the New York *Recorder* had a two-column article headed as follows:

IS HE A SECOND EDISON?

Herbert E. Rider's Electrical Inventions Are Attracting the Attention of Scientists.

HE EXPLAINS HIS EARTH-MAGNETO.

A Talk About His Underground Trolley, Steam and Heating Inventions, and His Plan for Harnessing the Power of the Ocean—A Brother of Maud May Rider.

Mr. Moore is a reputable electrical worker of some standing. He is endeavoring to produce something useful. We think his actual work is on the wrong lines, but give him full credit for attempting to do something for the public good.

Mr. Rider is a bald swindler, and the earth-magneto has been sufficiently exposed in these columns.

Yet how closely similar are the advertising methods employed by both.

The evil effects of the nonsense in regard to Moore's work in the *Herald* are made particularly evident by the way the *Herald* matter has been copied all over the country. A few days later a New Haven paper said editorially:

> A New York company is arranging to bring bottled lightning to everybody's door. Stored electricity will be delivered fresh every morning just as the milkman delivers the milk. This will supply electricity for cooking, for lighting where only a few lights are desired, for running sewing machines, and the like.
>
> There is nothing chimerical in this. The company will generate the electricity, fill the jars and deliver them as easily as the electric fluid is delivered by wires.

Thousands of people have been led to believe that this scheme is *practical.* Pennock and other miracle claimers are thus helped to sell more stock, and doubtless within a few months stock in this "bottled electricity" company will be offered for sale and find purchasers.

Does this sort of thing benefit the art? Does it benefit the public? Does it benefit those engaged in it? We think not.

Under the Searchlight.

Views and Opinions on Timely Topics.

Professor John Poo-Bah Barrett and His "Electrical Journal."

We closed an article on John P. Barrett's new newspaper enterprise in our issue of June 5th by saying that if there were anything in his past history to denote that it would have any effect on him we might make a few remarks upon the propriety of J. P. Barrett, holding the official position he does, engaging in the newspaper business. It might interest our readers, however, to know that Prof. John Poo-Bah's energies are directed in many lines, which will probably explain also the amount of the snug sum which the enterprising Professor has saved out of a small yearly salary.

In Feburary, 1892, Banks Cregier and S. H. Hayden brought suit against J. P. Barrett, alleging crookedness. This matter was fully ventilated at that time in the Chicago newspapers, but the suit was finally dropped, as we understand, for the reason that the two parties came to an amicable settlement.

We quote from an article published in the Chicago *Tribune* February, 24th, 1892, the following:

> In defiance of the rules and law governing such cases, said Barrett has for years been employed and engaged in other occupations and business requiring his personal attention. Some of these are "The Police Telephone and Signal Company," "The Chicago and Proviso Electric Railway Company," "The Cobb Vulcanite Wire Company," "The Electrical Reminder Company" and the "World's Columbian Exposition Company," from which latter corporation alone he receives a salary of $5,000, and from the others considerable amounts, all of which are exclusive of the sum of $4,000 which he draws from the city of Chicago for his services as superintendent of city telegraph.
>
> It is claimed that for this reason Mr. Barrett must be considered as having resigned his office and that his salary from the city ought to be withheld.

Our readers will probably think that this should be enough for a man who holds the responsible position of City Electrician for the city of Chicago, but John showed his fine commercial instinct and fine Italian hand by fortifying his position for many years in a rather ingenious way.

About ten years ago, when electrical installations were very few and far between, John saw a chance for his life. A city ordinance was passed organizing what is known to-day as the Electrical Inspection Department of the city of Chicago, each consumer to pay the trifling sum of $1.00 per electrical horse power for the plant inspected.

This money, of course, was paid to the city of Chicago, but the more income the more inspectors, which latter of course were appointed by John; hence, the more inspectors the more political friends to give a job to and the more pull.

John, of course, with his usual generosity, discriminated a little in favor of some of the larger corporations and his particular friends; in one case, for instance, a company paid $150 a month as inspection fees no matter what electrical horse-power was involved.

As a matter of fact, there is to-day in the city of Chicago a very efficient inspecting department organized and operated by the Board of Fire Underwriters which does not charge anything for inspection. The underwriters, of course, are the parties mainly interested as to fire risks, and the inspection of City Inspector has dwindled down to a farce. The city's inspection department is kept up by John for the income derived therefrom and for his own political friends.

As a matter of fact, if one compares the rules and requirements of the Chicago Fire Underwriters' Association, adopted September 14, 1893, and the rules and requirements of the Chicago Fire Department, adopted January 15, 1894, he will find one almost a verbatim copy of the other.

Another new departure was John's organization of the fake which is now known as the National School of Electricity and which was made the subject of a good many of our editorials.

But the Professor is very inventive and ingenious, and after having the school fake fairly started, a city ordinance was passed by which electrical workers in Chicago had to go to John for a license. The license could be obtained by anyone who could show his former experience or education, and the diploma of any certain high-grade schools (of course including the National School of Electricity) was sufficient to obtain this license.

So it will be seen that in the natural progress of evolution John had finally to have his own electrical organ to more fully and comprehensively teach his well-known business methods and electrical systems, and generally convey his talents to the large number of so-called students in the National School of Electricity and, incidentally, of course, get from the (not any more unsuspecting) public a few advertisements at the cheapest rates—no ad., no business—"Dr." Hornsby, of course, keeping up the supply of suckers—excuse us, we meant students—by paying to his "agents" $5 a head for every new acquisition.

We understand that the new Mayor of the city of Chicago, with the aid of the Civic Federation, has been trying to clean the city of Chicago, both literally and otherwise. Might we draw the attention of W. F. Baker, the president of the Civic Federation of Chicago, to the above subject. We think the investigations he might set on foot would keep him busy for a few months to come.

(*To be continued.*)

* * *

The Brush Works.

The Cleveland papers are somewhat inclined to doubt the correctness of the late news published in these columns in regard to the closing of the Brush works. They have no trouble in bolstering up the perfectly proper hope of Cleveland people that the works will not be moved by printing interviews with various people who "think they would know if any such plan were on foot." We don't think; we just know. The *Plaindealer* says:

> The matter was investigated by the Cleveland papers, and Mr. S. M. Hamilton, one of the officers of the company said that if the Brush works were to be closed he had not heard of it.
>
> The renewal of the assertion by ELECTRICITY that the works were to be removed practically gainsays the sincerity of Mr. Hamilton's declaration that the works were not to be closed. Mr. Hamilton was out of the city yesterday and Mr. C. F. Brush was shown the clipping from ELECTRICITY.
>
> "The man who wrote this," said Mr. Brush, "must be a sorehead. Although I am not connected with the company at present, it is hardly probable that the works would be closed and removed to Schenectady, N. Y., without my knowing something about the change. As far as I know the works are not going to be moved or closed, and as I said, if they were I would probably have received some intimation of the change."

Mr. Brush *is* out of the company, and has no knowledge whatever of what goes on at 44 Broad street. Mr. Smedberg would lose his job if he told the truth, and Mr. S. M. Hamill is an artist in the use of words. By the by, how strange it is that a man of Sam Hamill's abilities and attainments should be referred to by a reporter in his own town as Mr. S. M. Hamilton. Until the Cleveland papers know the name of their own leading citizens they had better not pretend to know much about matters happening 500 miles from home.

* * *

No Change in G. E. Officers.

The G. E. directors met on May 14 and re-elected the previous officers, adding the name of E. W. Rice, Jr., as third vice-president. The Coffinesque method of building railroads in the wilderness and in towns of 50 inhabitants, taking the bonds at 60 and selling them in Boston at 70 or 80, seems to be satisfactory to H. L. Higginson, J. P. Morgan and the rest of the board.

* * *

Congratulations Are in Order and Extended.

The following handsomely engraved card contains an announcement that will please a host of electrical men both in and out of electrical journalism:

> Mr. and Mrs. Samuel Faulkner invite you to be present at the marriage of their daughter Lucretia to Mr. Frank Loney Perry, Thursday evening, June 27th, at 8 o'clock, First Presbyterian Church, Chicago.

Mr. Perry has long been connected in an editorial and business capacity with the *Western Electrician*, and has in this way and through his many brilliant and venturesome reportorial exploits become widely known in electrical circles. One of his most thrilling experiences was in the maiden trip of a submarine boat in the Detroit River which he described most graphically in his own paper and elsewhere. A man who will voluntarily incur the unknown dangers of such a trip is not the one to flinch at a matrimonial venture, and we are only surprised that he has deferred the step so long.

This announcement is only another illustration of the force of good example. The head of the paper which Mr. Perry has served so long set the example but a short time ago, and the contagion has been spreading ever since until all his associates, with (we are sorry to say) one exception which shall be nameless, have been afflicted in like manner. The *Western Electrician* has been improved with each addition to the lady members of its staff, and we look for another improvement immediately after June 27th.

ELECTRICITY extends congratulations to Mr. Perry upon this his latest evidence of enterprise.

TWO VIEWS.

"ELECTRICITY'S" EFFORTS TO PURIFY THE TRADE SEEN FROM DIFFERENT STANDPOINTS.

Mr. C. W. Price, Editor of a Subsidized and Guilty Contemporary, Sees One Side.

(From the Electrical Review, June 12.)

Our spurty little contemporary, ELECTRICITY, is evidently tired. Its efforts to regulate the universe have wofully failed. It has commenced to scold and whine over lack of appreciation. It started out to kill the General Electric Co., the American Bell Telephone Co. and a few other companies (non-patrons), and is sorely chagrined to find them alive and growing in strength; besides, a few of its slow-going contemporaries were to be driven off of the face of the earth, and numerous individuals were ground to pieces by its disjointed pen (in its mind). Several electro-medical schemers and quacks were "exposed"—and are doing a bigger business now than before, which we all regret. These little disappointments often happen to infantile journalism. We shall miss our erratic and ill-advised, but seldom dull, little half-brother, if it is going to give up the fight and retire from a cruel and unappreciative field. Perhaps, however, its cries of disappointment mean the beginning of its own reform—although this thought requires an unparalleled stretch of the imagination.

A Reputable Manufacturer, Who Has Experienced the Injustice We Inveigh Against, Sees the Other.

To the Editor of ELECTRICITY.

DEAR SIR: Permit me to congratulate you on the articles contained in your last issue under date of June 5, particularly the editorial entitled "Where the Responsibility Lies" and your analysis of the "Pennock Electric System."

Your editorial analysis of the financial condition of the electrical trade is correct, as many others beside myself can well testify. Having been for several years secretary and treasurer of the —— Company, I was compelled to meet the very difficulties you enumerate, namely, the problem of either manufacturing and selling electrical apparatus at less than cost, closing down the works and waiting for trade conditions to improve, or obtaining sufficient capital to enable our company to at least control the market.

The policy of selling apparatus at less than the cost of manufacture is suicidal to any concern, and the second proposition of remaining idle until times improved was impracticable, as there seems to be no tendency on the part of the larger manufacturers to permit improvement in the electrical trade itself. The third alternative, of interesting a large amount of additional capital, was also impracticable, as your article demonstrates. There was therefore no option except of going into voluntary liquidation while still solvent and placing the assets in the hands of an assignee that they might be disposed of as a whole or in fragments as circumstances would dictate. I have no doubt you could find dozens of manufacturing concerns whose experience has been practically identical with the above.

I sincerely trust you will continue your present policy of placing the blame for existing conditions in the electrical field where it properly belongs and will further continue to expose electrical fakes, which are now, as they always have been, very much in evidence, and which have assisted in discouraging capital from investments in legitimate enterprise. Continue to publish a paper edited by the editors and not by the advertisers and you will be rendering the electrical fraternity the best possible service. I remain very truly yours, S.

Philadelphia, June 10, 1895.

* * *

DR. ADAMS'S AIR LINE.

Who Are the Bankers?

They May Pay Their Forfeits Out of the $9,000,000 On Hand.

Dr. Wellington Adams, head of the electric railway to be run from St. Louis to Chicago, says: "We have been detained in the construction of our road by the panic of the last two years and were hitherto unable to place bonds. We hear from our bankers in Chicago, who were to place the bonds, that they now have $9,000,000 raised, leaving only $1,000,000 to be raised. These are under a constant monthly forfeiture and this will cause them to expedite matters as much as possible. I am very confident that we will soon resume work."

* * *

The Backers are Responsible.

(From the Financial News.)

That is, in accordance with the known principle of equity, we must advise our readers to let that General Electric stock severely alone. Neither buy it, nor sell it short until the company makes a "sworn" statement of its affairs. It has *robbed hundreds of men, and its backers should be held responsible.*

DESERVING OF SUPPORT.

To the Editor of ELECTRICITY.

DEAR SIR: I have read the copies of your paper with much interest, but none so much as the issue of June 5. Your editorial in this number on "The Telephone Situation" is from the shoulder. For speaking out against such powerful corporations you deserve the support of all fair-minded and unbiased people.

JAS. D. RANDALL, Mgr.,
Telephone and Electric Specialty Company.
Memphis, Tenn., June 8, 1895.

* * *

We shall welcome Messrs. Armington & Sims into full-fledged membership in the electrical manufacturing industry. If they make as good dynamos as they have engines they will find a place to sell them at a good profit. There are still purchasers who want the best.

* * *

The controversy between our contemporaries as to which is the oldest may have its serious side. The oldest one is the guiltiest one, and upon it may be first laid the heavy hand of vengeance.

Personal.

Mr. John Starr, one of the leading men in the trade in Canada, was in New York last week. Mr. Starr sold the first T.-H. apparatus in France, and is now a general dealer in supplies at Halifax.

Mr. Hugh H. Harrison has joined Mr. R. B. Corey in the selling agency of Bergmann and Knight arc lamps. Mr. Harrison is one of the most popular young men in the business and will be welcomed back to the commercial line. He became connected first with Leonard & Izard in Chicago, was afterward in the Edison General railroad supply department and has since been with J. G. White and White-Crosby Company.

The Three-Wire System.

The State of the Art is Such that it is No Longer Necessary—Improved Methods of Distribution Described.

(Special from our London Correspondent.)

When new systems or improvements in existing systems are invented which revolutionize a particular branch of trade by effecting economies or increased efficiencies in the working, thus rendering the employment of any other method out of date, unreasonable or unsuitable, it is but natural that those desiring or finding it necessary to avoid the new invention should seek to perfect, or at any rate to devise, some means of their own whereby they may be enabled to take advantage of the purposes of the invention in question without actually infringing the patentee's rights. It may be some slight alteration which in itself is of comparative insignificance, yet coupled to the idea which it is sought to avoid alters the whole and enables the thing to be worked in such a manner as to ensure freedom from royalty impositions. In this way inventors have occasionally been the means, unwittingly, of indirectly bringing into the world certain improvements not attained by themselves.

A system of such importance as the three-wire system of electrical distribution was therefore bound to have about it both avoiders and infringers. That system, it will be remembered, was invented almost contemporaneously by Dr. John Hopkinson in England and Mr. Edison in America. Dr. Hopkinson's letters patent in England were dated July 27, 1882, and expire in 1896.

The many advantages of this system are known to your readers. The economy effected in copper used in the conductors for distribution by the introduction of the middle wire by Dr. Hopkinson enabled it to revolutionize the then existing system of electrical distribution. In the London Courts of Justice on November 4, 1892 (over ten years subsequent to the date of the patent), an action was heard against certain London electricity supply companies for infringement of the patent, and after a very lengthy hearing, in which most eminent counsel and expert witnesses were engaged, judgment was, on January 14, 1893, given in favor of the plaintiff, who secured damages, costs on the higher scale and the delivery over to him of all infringing apparatus. This decision was recorded in Electricity at the time. There were really several companies defendants in the action, though only one name was put forward. The result, of course, led the alleged infringers to seek means for effecting the distribution in some other way, and among the officials of the principal defendant company—the St. James's and Pall Mall Electric Light Company—there was some talk of disconnecting the middle wire from the point midway between the two generators and supplying any want of balance by motor transformers or separate balance machines, or by batteries. As a matter of fact a balancing transformer was fitted which fulfilled its object well and was presumably outside the patent, but the St. James's Company were advised that it would not do to fight the patent on those grounds, and in consequence they decided to abandon any appeal and forthwith paid the royalty. It is, however, thought in a responsible quarter that the patent could not be sustained against such objections.

Mr. R. E. Crompton (the president of the Institution of Electrical Engineers) was the first to use a three-wire system with secondary batteries. In a paper read before the Institution of Electrical Engineers some few years ago,* Mr. Crompton gave a description of a system which was first put down by him at Vienna in 1886, and all the subsequent stations designed and equipped by him in Great Britain have been on the same principle.

At the present date it is stated that the Vienna system is still working satisfactorily. As to whether this arrangement enables the avoidance of Dr. Hopkinson's systems without any possibility of infringement, Mr. Crompton's own opinion has always been that Dr. Hopkinson's patent is quite clear on this point, i. e., that under the term "generators of electricity" he does *not* include accumulators, and that consequently every one who bridges from outside to outside wire with the dynamo and compensates the other wires by means of accumulators *does not infringe*. Mr. Crompton says that the only reason why the London companies using this system did not fight Dr. Hopkinson was that that gentleman's people made such a satisfactory offer that it was not worth while fighting the matter, which was complicated by the fact that most of these companies then using Mr. Crompton's system with accumulators had at one time or other used Hopkinson's plan of two dynamos in series, and therefore would at any rate have been liable to back royalties for these periods which might have been levied at an exorbitant rate.

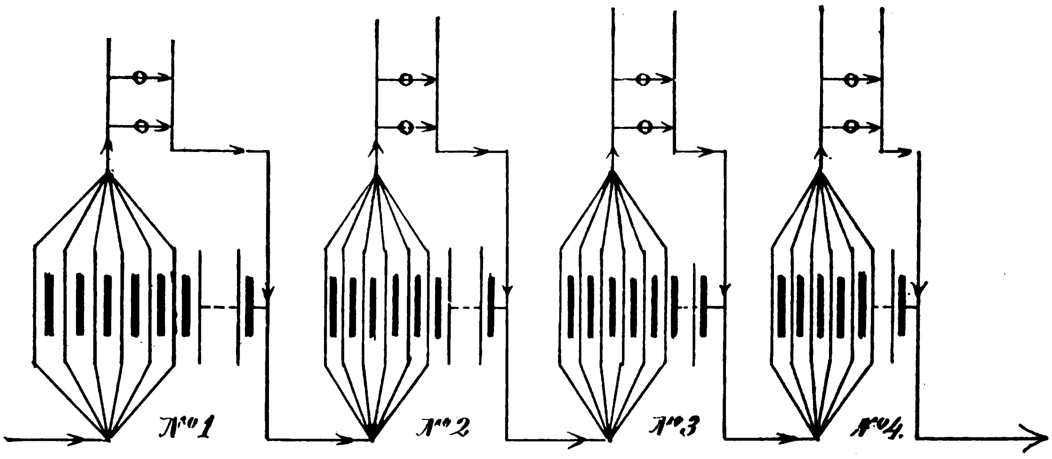

Diagram No. 1.

In Mr. Crompton's opinion the working of multiple wiring systems by accumulators or by equalizing machines is more economical than working them by Dr. Hopkinson's patent, as the latter contemplates always running two machines in a three-wire system or four machines in a five-wire system. This reduces the size of the machines, makes them less economical, and also prevents the machines being run at a good load factor, which is also very detrimental to economy.

It is not out of place to refer to the Vienna system more in detail as stated in the paper already referred to. The arrangement consists of charging accumulators from central groups of batteries of accumulators arranged in series. Each group of accumulators consisted of 52 cells giving the 100 volts required for the lamps with a comfortable margin. The total electromotive force required to charge the four groups of batteries in series varied from 430 volts at the time the batteries are giving off work to 480 volts for the short time during which the charge is being completed. This includes the loss of current in the mains, the generating stations being situated 1,400 yards from the distributing station. On the subject of the regulation of groups of batteries placed in series, the author said his was a simple matter and had been carried out at Vienna and elsewhere in the following manner:

The diagram No. 1 represents four battery stations arranged in series. Supposing that the current enters at the left hand lower corner, passes through the first battery with the lamps parallel to it, passes from the end of that battery to the commencement of the second, and so on to the third and the fourth, and that this current is kept constant or varied at will at the central station by means of adjustable electrical current governors, we have to see how we can keep the potential constant in each of the four groups of lamps shown. In each accumulator one terminal is permanently connected to one of the discharge mains and to one of the charging mains. The other terminal attached to the other mains can be shifted from cell to cell according to the electromotive force required in the corresponding lamp circuit by a movable contact forced through a series of contact rings. The bunch of lines shown in the diagram at the extremity of each of the accumulators represents the movable terminal. As a rule the terminal for charge and discharge at this the regulating end of the battery neither receives nor gives off current, so that there is no loss of energy in the shape of electromotive force. The ring contacts are arranged in line in such a manner that a circular ring contact made of thin sheets of copper can be forced through them in turn by a central screw spindle. The double form of contact regulations was found to be more convenient, because when it became necessary to fill up the end cells they could charge into a larger number of cells than were discharged from; at such times only was there any loss of electromotive force in the regulating apparatus. The arrangement for coupling up to the apparatus is very simple; the mains for charge and discharge are attached to the fixed disk contacts on the central screws; the regulating cells of the battery are coupled to their respective contact rings by sockets. The large central station at Vienna is worked by E. P. S. accumulators.

Mr. Crompton has found that the percentage of accumulators which he has always added to complete the three-wire system has been invariably found sufficient to provide the extra output required during short periods of maximum load.

In Mr. Stuart A. Russell's book on "Electric Light Cables" there is a lucid description of a modification of the three wire system, which is as follows:

"A modification of this (the Hopkinson three-wire system) is sometimes employed which dispenses with the third wire in the feeding mains and permits of the use of one dynamo supplying current at 200 volts, instead of two dynamos supplying current at 100 volts. Fig. 2 shows the arrangement of the apparatus, in which D is the dynamo supplying current at 100 volts, which is conveyed by a two-wire feeder main to the distributing point A, at which is placed a battery of accumulators; and to the two outside terminals and the middle terminal of this battery the

---

[*] Proceedings of Inst. of Electrical Engineers, Vol. XVII, Nos. 72 and 73. Paper by Mr. Crompton on "Central Station Lighting; Transformers vs. Accumulators."

three distributing wires are connected. The accumulators here play the same part as their namesakes do in a system of hydraulic supply; the half battery connected to the circuit which requires most current discharges into that circuit, and so helps the dynamo machine; and the half battery connected to the circuit in which the demand is smaller is charged by the surplus current."

While there is no economy in an installing by this method over the other—the accumulators costing as much as the extra wire and second dynamo—an economy in operation is attained. During the hours of light load the batteries may supply all the current required, permitting the shutting down entirely of the central station during those hours.

Still another method has been proposed for simplifying the three-wire system. This consists in using a single dynamo giving 200 to 220 volts. To the brushes of this are connected the two outside wires. The neutral wire is connected to the center of the armature coils, and thus carries at potential midway between that of the two outside wires. This method is evidently quite adapted to the alternating current.

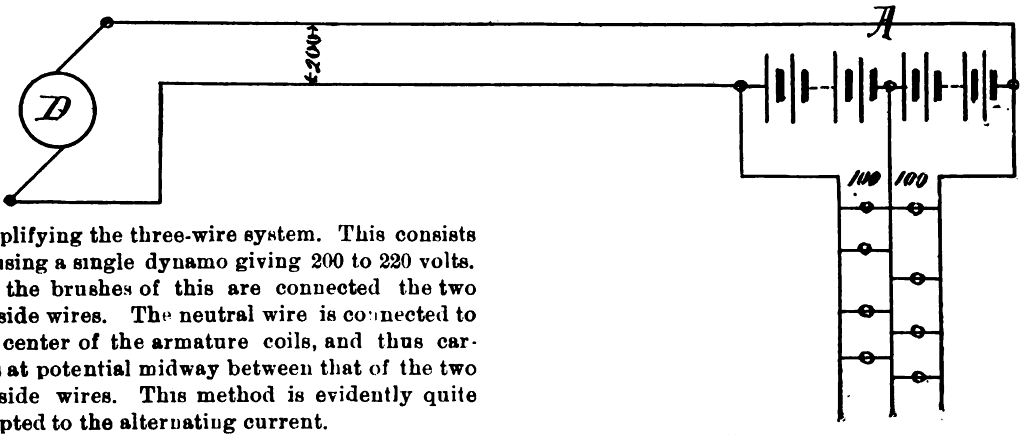

FIG. 2.

With so many methods at hand which seem to be as good if not better than the regulation three wire system, it would seem clear that the threats of the G. E. Company by which they hope to control should fall flat.

Electric Haulage at the Berwind-White Company's Eureka No. 22 Colliery.*

"A mine turning out over 11,000 tons of bituminous coal per month and not a mule about the place." Such is the statement of Mr. A. S. R. Richards, general superintendent of the Berwind-White Coal Mining Company at Osceola Mills, Pa., in speaking of the recently opened Eureka Colliery No. 22, which comes under his management. While there are one or two other instances of coal mines where mules are unknown, this Eureka No. 22 stands alone probably in never having been worked by mules for a single day.

Last fall Mr. W. A. Crist, the general manager of the Berwind-White Company, and General Superintendent Richards decided to give electric haulage a test and selected No. 22 to make the trial. The installation was made and within two hours of the placing of the electric locomotive on the mine tracks it was hauling coal and has so continued with no interruptions, except a short shut-down one day when an oiling device in the steam engine demanded some attention.

Through the kindness of Mr. Richards the writer is enabled to present a description of the plant.

Anticipating an increase in the number of locomotives used, if the trial proved satisfactory, the power plant was installed much larger than at first needed. The installation work began in the fall. A boiler house 33 ft. long × 17 ft. wide was first erected. It is built of wood placed on stone foundations. In it is set a 66-in. × 16-ft. return tubular boiler, with 54.4-in. tubes, made by the Harrisburg Foundry and Machine Company. The boiler is set with full arch front, entirely in stone, lined with fire-brick. It is provided with a 70-ft. stack, 30 in. diameter, and is fed by a Garfield double-jet injector, no feed pump being used. The water supply is obtained from an artificial reservoir 1,200 ft. away, which is fed by springs above the level of mine drainage. The water flows to the power house through a 3 in. wrought iron pipe laid 3 ft. underground.

The engine house is of wood with stone foundations, and contains a comfortable office for the electrician. The locomotive shed immediately adjoins it. It is 46 ft. long × 20 ft. wide, and the shed forms an L 16 ft. × 24.

The engine and generator are set with about 20 ft. belt centers, on cut stone foundations laid with Portland cement, from 6 to 8 ft. deep. The engine, automatic high speed, is an "Ideal," made by the Harrisburg Foundry and Machine Company. It is 13 in. × 12 in., with a speed of 300 revolutions per minute. The normal steam pressure is 80 lbs. per square inch, at which pressure, with $\frac{1}{4}$-cut-off, the engine develops from 97 to 100 H. P. A Schieren double leather perforated electric belt, 12 in. wide, drives the generator from a 52-in. flywheel.

The General Electric Company furnished the generator and electrical equipment. The generator is set in a wooden cap-piece over the stone foundation and is of the multipolar type, 90 K.W. capacity and wound for 500 volts with an over-compounding to allow for a 10% loss in the line when under full load. The machine runs at a speed of 700 revolutions per minute, the pulley being 21 in. in diameter.

The switchboard is of oak, made in the skeleton type, and carries an automatic circuit breaker, a current indicator, a Weston round pattern voltmeter, a double pole main switch and a field rheostat. Insulated wires carry the current to the locomotive shed, where connections are made to the trolley wire and to the ground return. A lightning arrester is connected in just at the point where the trolley connection is made.

The trolley system used is the single trolley, rail return, which was used by the Thomson-Houston Company in its first underground plants. The trolley wire is the same size as is used in street railway practice, No. 0, and at present it is unnecessary to use any auxiliary feed wires, the trolley itself carrying sufficient current to operate the locomotive at any point on the line, under full load.

In the outside construction work the line is supported by wooden poles carrying cheap but effective brackets, made of 2-in. and $1\frac{1}{4}$-in. iron pipe. The brackets support the mining insulators and clamp ears, of the General Electric type. The clamp ear, doing away with the soldering of the trolley to the ear, is of great advantage in first cost of construction work and also in quick construction and repairs and in keeping the line taut and in good shape. Underground the same insulators and ears are used, the insulators being carried generally on short wooden strips held to the roof by special expansion bolts.

The track is laid on 6 in. ties, with an excellent roadbed. A 30-lb. rail is used for 5,680 ft. of main haulage track and 20-lb. rail is laid for the remaining 3,450 ft. of track now in use. Heavy fish plates are everywhere used at rail joints.

The rail return is supplemented by bonding wires connecting from rail to rail. No. 0 bare copper wire, turned, is used for bonds, connected to the rails by channel pins $\frac{9}{16}$ in. in diameter.

The locomotive now doing all the gathering, hauling and distributing, is a two motor mining locomotive, with 1,500 lbs. draw-bar pull capacity, at a speed of 8 miles per hour. Its horse-power rating is therefore about 33. For a starting pull much more than 1,500 lbs. is shown, and the rating in every way seems conservative. As an evidence of this the writer noted at one time an ammeter reading of 110 amperes at 560 volts, which, making allowances for small amount of current used in lighting, losses in the line, etc., meant an exertion of about 70 H. P. by the locomotive. This excessive demand was only temporary. The locomotive is of the low sloping back type made by the General Electric Company, which has come to be called the "turtle back." It carries a motor geared to each axle, and is equipped with the latest improvements in controlling and operating apparatus. Its construction makes it practically waterproof and the heavy iron frame and covering offer a substantial protection from damage by falling roof or in wrecks. The latter are of very infrequent occurrence, however. It is a little over 10 ft. long over all, 5 ft. wide, and its height allows its operation where the trolley wire is not less than 36 in. from the top of the rail. The gauge is 36 in., the wheel base 44 in., and the machine weighs about 6 tons. Its heavy double bumpers are made to coincide with the car bumpers. The cars in use, made by Pie & Co., of Osceola Mills, are of excellent design for low veins, weigh about 980 lbs. empty and carry about 2,400 lbs. of run of mines coal. They have a wheel base of 22 in., and self-oiling 14 in. wheels. For couplings the old chain and hook have been replaced by a link and pin, as better adapted to electric haulage. At the present time 200 of these cars are in use.

An inspection of the map will show the method of opening up the mine which has been employed, and the distance over which the one locomotive does the hauling. As stated above, the output during April was 11,242 tons. The largest single day's work was 452 cars of coal and 20 cars of rock. Handling the latter, owing to their weight and the time taken in switching them to the gob track, is equivalent to hauling about twice the number of coal cars. The amount of coal hauled that day was 472 gross tons. The average output is 450 net tons per day of 10 hours, but this is being raised constantly. Of this output, 49% comes from Drift No. 1, 27% from Drift No. 2, and 24% from Drift No. 3. The maximum grade against load is 3% up the west track at the tipple. It was when the locomotive was pushing a trip of 19 loaded cars and 6 empties up this grade that the ampere reading above noted was taken. The maximum grade in favor of the loads is $2\frac{1}{2}$% in No. 2 drift, about 800 ft. from the bank mouth. A comparatively small tonnage goes over the 3% grade mentioned above, so that with the exception of a very short 3% grade 300 ft. from the mouth of No. 3, the grade against the loads average well under 2%. The average grade of all the entries now wired, taking into account al distances, is a little in favor of the loaded trips.

The minimum radius of track curve is 36 ft., on the small spur leading into the motor shed.

---

*Written by Timothy W. Sprague for the *Engineering and Mining Journal*, and by kind permission of the latter reproduced, with map, in ELECTRICITY.

The minimum radius inside the mine is 51 ft.

Not taking into account the distance covered in switching, gathering trips, etc., the locomotive is now making about 20 miles per day. The maximum number of cars hauled from each drift to the tipple is as follows: From No. 1, 42; from No. 2, 25; from No. 3, 32. No. 4, has but just been wired and is little used as yet. A record has been kept of the amount of fuel used by the plant. Naturally there is little attempt at getting this down to a minimum under the circumstances, although run of mine coal is used. The record shows 26 gross tons used per month, or about one gross ton per day.

The locomotive arrived on January 8th of this year, and, as stated, has been working constantly and without causing a moment's delay since. That the test is satisfactory to the Berwind-White Company is evidenced by their having recently ordered of the General Electric Company three more locomotives, each of 800 lbs. draw-bar pull capacity, for this same mine, and a complete equipment for electric haulage at Eureka No. 26. The construction work of the latter plant is already well under way.

The smaller locomotives at No. 22 are to do the gathering of loaded trips inside for the larger machine to haul to the tipple from several main gathering points and the distributing of empty cars from the same points to the rooms. They will be put at work, one at a time, during the summer, as required by increased distances and tonnage.

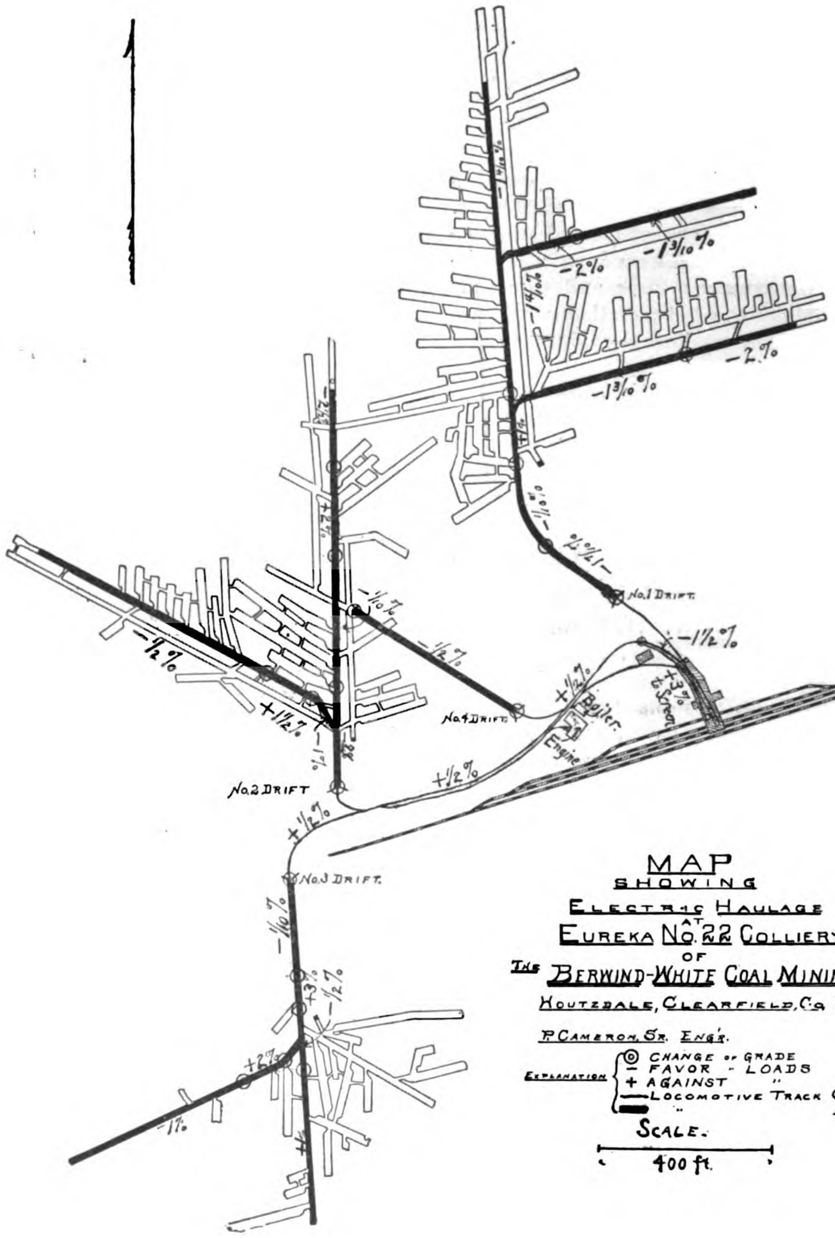
For the operation of the entire haulage plant there are required but three men. One man does the firing and looks after the engine and dynamo. The motor man, or locomotive driver, does all the rest, assisted by a coupler, or trip man. The time of Mr. Wells, the electrician, is not properly chargeable to this plant, as he is now putting in the plant at No. 26. and as other installations are made the proportioned amount chargeable to each plant will be small. Allowing a liberal percentage for interest and depreciation and putting in the coal at 75 cents per ton, the cost of haulage comes inside of 2 cents per ton. The addition of more locomotives will not add materially to the cost of operating the power plant, and the additional charge for interest and depreciation will be slight. Each locomotive will require its own motorman, with perhaps one or two couplers, for the three new machines. The increased output will more than offset these charges, however, and bring the cost per ton lower than at present, probably.

Some observations made during a trip (not for exhibition purposes) into No. 1 drift from the tipple, straight into the face of the entry, may be of interest. The locomotive started in, pulling 24 empty cars, against a grade of from 1½% to 1.7%, at 11:12 A. M. At 11:17 all the empties had been dropped along the heading, being taken by the miners directly into their rooms. The last empty was dropped at a point about 1,800 ft. from the tipple. In the meantime, however, we had picked up 12 loaded cars, which had been placed in the main track by the miners, and were pushing those ahead of us in addition to pulling what remained of the empties.

At 11:23 the return trip was started. We were then pulling the 12 loaded cars and on the way out picked up 16 more loaded cars, with which we arrived at the tipple at 11:30. The actual running time was therefore five minutes going in and seven minutes coming out, a total of twelve minutes, during which time 24 empty cars were distributed at entrances to rooms at distances varying from 1,000 ft. to 1,800 ft. from the tipple, and 28 loaded cars picked up along the same distance and delivered at the tipple.

The wait outside was longer than necessary, owing to a delay in making some couplings. In considering the operation of the plant it must be borne in mind that it is so new and work is advancing so rapidly that the haulage arrangements have each day to be modified. When the smaller locomotives are at work doing the gathering, the main haulage work will be greatly simplified and expedited.

The accompanying map shows the relative positions of the drifts, power plant and tipple, and as noted the grades are shown in percentages, the sign "+" signifying a grade against the loaded trips; the sign "—" a grade in favor of the loaded trips, and the small circle or dot on the haulage lines denotes a change of grade. The illustrations show a general view of the engine and boiler houses and tipple, with a loaded trip of 21 cars attached to the locomotive, and the inside of the engine room.



The plant is situated at Windcrist, Clearfield County, Pa., and is visited by a large number of operators as well as curiosity seekers, all of whom find a hearty welcome from the Berwind-White officials. It is intended later on to operate ventilating apparatus by electricity, and the current is now used for what lighting is necessary.

The writer is indebted to General Manager Crist and General Superintendent Richards for many courtesies extended, and also to Peter Cameron, Jr., mine boss, and Harry J. Wells, electrician, for information furnished. The maps and some general data were kindly supplied by Peter Cameron, mine superintendent, and William Cameron, his assistant.

The Telephone Case.

U. S. Circuit Court of Appeals' Ruling Upon the Berliner Patent.

Charges of Fraud Not Proven.

The opinion of the United States Circuit Court of Appeals has at last been handed down. It is a voluminous document of about 40 pages, written by Judge Putnam, which opens with the following statement of the case:

This is a bill in equity filed February 9, 1893. touching a patent issued November 17, 1891, to the American Bell Telephone Company, as assignee of Berliner. The alternative prayer is that the patent be in all things recalled, repealed and decreed absolutely null, but that, if the patent is not deserving to be wholly repealed, but is repealable in part, a decree be made repealing only such part as the court shall deem to be repealable. As to the latter part of this alternative prayer for relief, the Court has heard nothing and there is no occasion to consider it.

Berliner's original application was filed June 4, 1877, and Patent 463,569 was issued more than fourteen years thereafter. In a general way it covers the microphone.

The pith of the case, as stated briefly for the counsel for the United States, is:

1. That Patent 463,569 is void for illegal delay in its issue, and
2. That it is also void on the ground that the prior patent 233,969, was granted upon the same application, to the same applicant, for the same invention.

The substance of the opinion is by no means as far-reaching and so decisively in favor of the Bell Company as the first reports led the public to suppose, for, as will be seen from the parts quoted below, it merely reinstates the patent in the position where it was before Judge Carpenter's decision declaring it null and void. In other words, the Berliner patent is now in the same position as any other patent granted by the United States Patent Office, viz., possessed of prima facie evidence of validity, which validity may be attacked and must be defended before the courts in the same way as other patents upon which adjudication has not yet been had. The only point that has been settled in this case is that the patent is not void by reason of illegal delay in its issue.

The second claim of the United States, "that it is also void on the ground that the prior patent, 233,969, was granted upon the same application to the same applicant, for the same invention," is met by the statement that the examiner and the Board had before them all the facts bearing on this branch of the case which are now known, and understood the law, so that the patent was issued under no mistake of either law or fact, the Court adding that "the most that can be claimed by the United States is that the officials of the Patent Office, having all the law and facts before them, erred in the exercise of their free judgment in the determination that the earlier patent did cover the invention described and claimed in the later one. Even were this so, the result was not a mistake in the sense of the law in its application to the principles of cancellation of deeds and other instruments; but it was merely an erroneous judgment and determination of the ultimate fact deduced from the primary facts, all of which were known."

"As we are clear," says the Court, "that this proposition of the United States cannot be sustained on the law, even admitting the facts to be as claimed, *we will not undertake to determine the question of the substantial identity of the respective claims of the two patents, or any of them. We prefer to leave that without prejudice, in the event it hereafter involves other individual or corporate rights.*"

The question in regard to the effect of the first patent (by date of issue) upon the patent in suit is therefore still open.

As regards the illegality of the delay in the Patent Office, the appellants claim that "the duty of the Bell Company was to get its patents with the least possible delay by the exercise of all its legal rights. Its submission in silence to delay directed by the Commissioner in violation of his duty was a failure in the discharge of its duty." The Court in reply to this enumerates a number of things that the Bell Company had the *right* to do, and then says: "The imagination can hardly put a limit to the things it had a right to do. To say, therefore, that it was bound to do in the public interest all that it had a right to do in its own, and that if it did not do this it should pay the penalty of a forfeiture of an invention said to be extremely valuable, is a proposition so unreasonable that the mere statement of it by the United States seems to confess the weakness of their case."

To the claim that although the officials of the Patent Office were guilty of gross dereliction of duty in their treatment of the Berliner application, all that was needed to bring matters to a focus was greater diligence on the part of the Bell Company, the reply is:

"Whether, however, the law's measure is that of reasonable diligence or the highest, the courts have no standard by which they can determine what amount of informal solicitation would have been proper.

"It must be admitted that it is not only necessary for the United States to prove that there was a lack in this direction but that the lack contributed to the result... There is no proof which enables us to form proper judicial conclusions on this point. If the record showed that the American Bell Telephone Company had failed to make the usual communications, whether oral or written, there might be something which the law could take hold of; *but as the proofs stand the fact is otherwise.*"

After referring to the claim of the appellants that the Solicitor General and the Commissioner had been derelict, the opinion goes on to say:

"The United States seem to assume that the Solicitor General, as well as the Commissioner, failed to appreciate the grave consequences, as now described, likely to arise from delay in acting on the application touching the Berliner microphone, and that it was the special duty of the defendant corporation to set him right. But however this may seem, and looking at the matter from the position of those accustomed to engage in large and important litigation, we cannot doubt that the counsel for the United States would be forced on reconsideration to agree with the Court that at the crisis to which we refer (viz., the Drawbaugh interference) any approaches by the American Bell Telephone Company to the Solicitor General, having regard to anything which would weaken or hamper the prosecution of the then suit, would have been regarded with suspicion, and would have been entirely beyond and outside of the efforts reasonably expected from solicitors and counsel with reference to any pending hostile proceedings. *Like every other proposition in the case having in view an explanation of the practical methods in which the American Bell Telephone Company could have exercised at various stages the extreme degree of diligence asked of it by the United States, this one fails to bear out any test whatsoever.*"

But it is said by the United States that the Patent Office could easily have disposed of Drawbaugh, because at that time the law was well settled that under the statute of 1870 two years public use, even without his consent, was fatal to him, and Manning vs. The Cape Ann Isinglass and Glue Company is referred to as settling this point. The Court says: "*This case was not* decided until May 7, 1888. It did not involve this question, and what was said therein touching it was a *dictum* and was never acquiesced in by Drawbaugh's solicitors. . . The Bell Company was compelled, with reference to this application, to meet the practical condition of things, and we must put our course ve in t at position. Therefore whatever may now be said as to the theoretical side of the law, it is more appropriate to the purposes of this case to observe that Drawbaugh's solicitor did succeed in practically retaining his application under adjudication by the Patent Office until near the close of October, 1891."

The Court next pointed out a clear inconsistency on the part of the United States. Referring again to the Drawbaugh case, it says: "It was claimed by the United States at one point that this litigation did not involve the microphone, but with a clear inconsistency the United States, at another point in its argument at bar, rested one of its propositions as to the alleged duty of the Commissioner at a certain crisis on the distinct ground that the Circuit Court had decided that Drawbaugh did not invent the microphone." "The fact is," said the Court, "that the entire dispute as between Drawbaugh on one side and Bell, Edison and Berliner on the other turned on one and the same question, viz., the truth or falsity of Drawbaugh's story; so that, as testified to by the president of the American Bell Telephone Company, if Drawbaugh's story was substantially true it cut up by the roots all that Edison and Berliner had done."

The Court expresses its opinion of the suggestions made by the United States as to what the Bell Company *should* have done to avoid the delay in the following words:

"The practical summing up of all these various suggestions is that the American Bell Telephone Company is, in effect, censured for not reforming both the practice and the officials of the Patent Office. We think this demand is without parallel or precedent, that the case may justly be stated in this form, and that, when thus put, it shows itself so revolutionary as to require the legal mind to reject it on mere statement," and it further claims that the United States "have failed to meet the burden resting on them, of proving that the lack of compliance with what they claim should have been done had any practical result in producing the delays complained of." That the Bell Company with all its resources could have found some way to break the deadlock if it had earnestly desired so to do, *may* be true, "but the courts have never yet been vested with authority to deprive any person or corporation of property or rights on the strength of any such mere assertion, nor without allegations and proofs in a definite form.

"We think this is the first instance in which either the people or the king, wherever the common law prevails, has sought to revoke by legal proceedings, on the ground of imputed or merely legal fraud, a grant of this character, issued to a subject after full official knowledge of all the facts, where there has been no deceit, collusion or corruption, and where the subject duly complied with all statutory and departmental requirements, *merely because the officers in charge have been dilatory and the subject failed to use zeal in spurring them on.*" . . "*We do not determine that any degree of laches whatever will forfeit a patent once granted*, reserving, of course, cases of abandonment, and other cases where, through laches, the equities of strangers have become established, neither of which classes are involved in the suit at bar.

"*The United States asks us to establish a period of limitations other than fixed by statute,* and we do not decide that under any circumstances we have any authority so to do. *We merely determine that the case of extreme diligence, as made by the United States, cannot be maintained.*"

The Court then goes on to show that while the delay in this case was unusual, it was not unprecedented, and it is stated that during the two years 1893 and 1894 forty-nine patents issued with an average of ten years after the applications were filed—ten of them ten years or over, and several of them fourteen years or over.

"*The decree of the Circuit Court is reversed, and the case remanded to that court with directions to dismiss the bill.*"

A NEW CONTACT SYSTEM OF ELECTRIC RAILWAYS.

The Westinghouse Electric and Manufacturing Company have acquired the recent Wheless patents of electric railways, and are exhibiting a working model of the same on the fourth floor of the Equitable Building, on Broadway, New York. In this system a metallic return is used, and the roadbed is provided at intervals of less distance than the length of a car, with sets of three metallic plates extending slightly above the street paving. These connect by means of insulated wires with electromagnetic switching devices located beside the track. Underneath the car are three metal contact bars which make contact with these metal plates as the car proceeds. Within the car is located a small storage battery, and this by means of the contact bars and surface contacts actuates the electromagnetic switches by which the line current is thrown into connection with the motors. When the car is not over the contacts the metal plates are not in circuit, so that there is no chance for leakage by this cause, but as the car proceeds over successive plates it first picks up the current, and then as it passes off drops it again, leaving the track connections entirely dead.

The model forms a most interesting working exhibit, and is well worthy of a visit of inspection.

LOUISIANA LIGHT COMPANY'S AFFAIRS.

Efforts to Displace R. T. McDonald and Maurice Hart.

In the application for a receiver for the Louisiana Electric Light Company, filed two weeks ago by the United Electric Securities Company, charges of fraud and gross mismanagement are made against Messrs. R. T. McDonald and Maurice Hart, two of the leading directors. Among other things it is charged that—

In the year 1889 the president and directors entered into a contract with the Fort Wayne Electric Company of Fort Wayne, Ind., whereby the Louisiana Electric Light Company agreed to give to the Fort Wayne Electric Company $425,000 of the stock of the Louisiana company for the purchase of certain patent rights which had no value to the knowledge of the directors of the defendant corporation, and that the stock was delivered by them knowingly for no substantial consideration.

That on or about January, 1891, R. T. McDonald and Maurice J. Hart were the owners or controllers of the stock of a certain bankrupt or worthless corporation, known as the New Orleans Tower Company, and were at the same time directors of the Louisiana Electric Light Company, and that the president and directors of the latter company, with full knowledge of the aforesaid facts, entered into a contract with two of its members, viz., R. T. McDonald and Maurice J. Hart, whereby in consideration of a transfer to the Louisiana Electric Light Company of $480,000 of the stock of the said New Orleans Tower Company it agreed to assume and did assume the debts of said company, amounting to $155,000.

That on or about September, 1892, and prior thereto, the Fort Wayne Electric Company of Fort Wayne, Ind., bought out the Edison Electric Company, a corporation doing business in the city of New Orleans, and that on the 29th of September, 1892, the president and directors of the Louisiana Electric Company voted a sum of $50,000 as a credit to the Fort Wayne Company, without any lawful consideration, but under the pretence that the said company had benefited the Louisiana Electric Light Company by purchasing the Edison Electric Light Company.

That after said purchase of the Edison Electric Light Company by the Fort Wayne Electric Light Company, the president and directors of the Louisiana Electric Light Company passed a resolution offered by R. T. McDonald by which, in consideration of $200,000 of stock of the Edison Electric Light Company, the president of the Louisiana Electric Light Company was authorized and directed, in behalf of said company to guarantee the payment of the principal and interest of $500,000 of the bonds of said Edison Electric Company, and that the said bonds have actually been indorsed and guaranteed by said Louisiana Electric Light Company, but that the consideration of said guarantee, viz., the $200,000 of stock of the Edison Electric Campany, has never been delivered to or received by the Louisiana Electric Light Company, which company has thus assumed a liability of $500,000 without receiving any consideration whatever therefor, and that the said stock was actually received and is now held by R. T. McDonald and Maurice J. Hart, individually.

That the affairs of the Louisiana Electric Light Company have in divers and sundry ways been grossly mismanaged by the president and directors thereof: that by reason of said mismanagement the corporation has become utterly insolvent; that in addition to the $700,000 of first mortgage bonds the company has outstanding about $800,000 of second mortgage bonds, the coupons on all of which mature semi-annually on the first days of June and December of each year; that the coupons maturing June 1, 1895, have not been paid, and your orator is informed that a large part of previously maturing coupons had not been paid and canceled by the company, but were taken up by others without being canceled; that the company is unable to meet its other current obligations and, as your orator is informed, went to protest in bank, the 6th day of June, 1895; that its most valuable source of revenue is from its contract for lighting the city of New Orleans, and your orator believes that its prospective revenues from that and other sources have been hypothecated in advance to creditors up to and including March, 1896, and that amongst said creditors who have received such hypothecation for a large amount is the Fort Wayne Electric Company.

When the case came up on an order to show cause why a receiver should not be appointed, on June 13 last, all the parties interested appeared in court. Fenner & Denegre represented the petitioners and Judge T. J. Semmes appeared as counsel for the president and board of directors of the Louisiana Electric Light Company. Judge Semmes stated that the interested parties were hopeful of an adjustment of the affairs of the Louisiana Company and asked that the hearing of the application for a receiver be postponed until June 28, which the court granted.

This action at New Orleans is merely another move in the fight of Coffin *vs.* McDonald, and it is no credit to the perspicacity of the latter if he fails to see it and to strike back.

The United Electric Securities Company is the one on which Mr. Coffin floated into apparent success. To those who are posted in the affairs of this corporation, as ELECTRICITY is, it seems strange indeed that they dare come into any court charging fraud upon any one else; that they have the effrontery to invoke the aid of any court in carrying out their schemes; that they dare above all things take the chances of provoking a fight with R. T. McDonald, who knows all their methods.

Notwithstanding all that has happened in the last two years, it is evident that Mr. McDonald has hesitated to open the warfare upon the G. E. Company which was expected. After the plainly evident sufferings of the Ft. Wayne interests from their few years of subserviency to Mr. Coffin, keeping them back from the development of new lines of apparatus—from keeping up with the times, as it were—it has been a surprise to those who know Mr. McDonald best that he has not made stronger efforts to re-establish his position, even at the expense of an irreparable break between him and Mr. Coffin.

Why should there be any more trades and deals? Why should any company keep out of any line of manufacture to accommodate a rival, even for a consideration?

We have always maintained that Mr. McDonald is a shrewder and abler man than C. A. Coffin. Why does he not assert himself?

After this attack upon his honor and business methods, half believed to be an honest one in New Orleans, according to the press of that city, can Mr. McDonald hesitate any longer? Can he longer suppose for one moment that Mr. Coffin has any other object than he had in August, 1893, to wit, to drive Mr. McDonald entirely out of the field?

We have no doubt that this matter will be secretly settled between the Securities Company, Coffin and Mr. McDonald. But what credit is there in this mode of procedure?

The Electropoise.

(From the Electrical Review, London.)

The Electropoise, notwithstanding what has been said of it in our own columns, and more particularly in *Science Siftings*, seems to flourish, judging by a full page advertisement of this appliance, "which polarizes the entire body," appearing in the *Gentleman's Journal* for May 15. In America our contemporary, ELECTRICITY, has been waging a war of extermination against this "home cure without medicine" with, we believe, considerable success, and we thought its pretensions had been completely exposed in the old country. However, it was evidently only scotched, not killed, so we would suggest that the poor foolish dupes whose testimonials are printed in the aforesaid advertisement should read *Science Siftings* to learn what the Electropoise consists of.

The Telephone Situation.

It is expected that the National Association of independent telephone manufacturers will meet in Pittsburg on Monday next to perfect their organization.

Recent Experiments on the Electric Discharge by Lord Armstrong[*]—II.

This peculiar quasi circulation in the electrostatic field which Lord Armstrong's experiments appear to indicate is of the greatest theoretical interest. Several experimenters have obtained analogous results, and attempts have been made to explain them which, however, do not appear altogether satisfactory. Faraday, in 1838, observed the movement of dust particles, and silk fibers in non-conducting liquids, in the opposite direction to the current, and also a convective movement of the liquids themselves in the same direction as the current; and many other experimenters have made similar observations with a variety of other powders. Electric convection is considered to be due to layers of the dielectric liquid in contact with the electrodes getting surcharged with electricity, owing to the fact discovered by Quincke, that conduction in such liquids does not follow Ohm's law, the current increasing faster than the E. M. F. Near the electrodes the fall of potential is more rapid than in intermediate parts of the field, and consequently electricity will flow more rapidly into the liquid from the electrodes than it is drawn off by the field beyond. The surcharged layers of the liquid are repelled, and thereby produce a convective movement. The movement of suspended particles in the opposite direction to this convective current in the liquid is considered by Quincke and Helmholtz to be explained by supposing that the contact of the liquid and the particles gives them opposite charges. This explanation, however, appears to be incompatible with Lord Armstrong's experiment, where the cotton thread is connected to the positive electrode, and therefore must have the same kind of charge as the convective liquid current moving away from the positive pole.

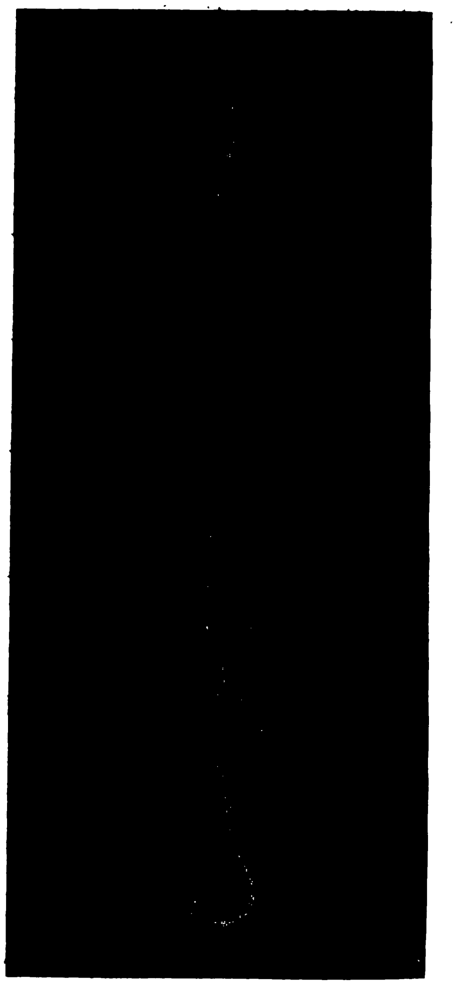


FIG. 7.

Another group of Lord Armstrong's figures show some peculiar photographic actions of the discharges. It has long been known that under certain circumstances the lightning flash produces a reversed image or "dark flash" on the photographic plate. This subject has been investigated by Clayden*, who came to the conclusion that the reversal of the image of the lightning flash was due to the superposition of light reflected from white clouds striking the photographic plate before or after the flash. He found the "dark flash" had frequently a white core, and this he found he could reproduce in photographs of sparks from an influence machine, when these sparks were produced by large Leyden jars, but not when the fainter sparks from smaller Leyden jars were used. In the latter case there was no white core, the whole of the spark image was reversed.

---

[*] From the *Electrical Review* (London.)

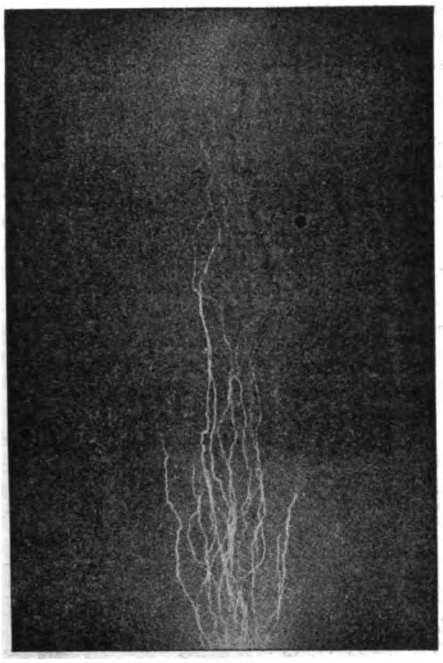

FIG. 8.

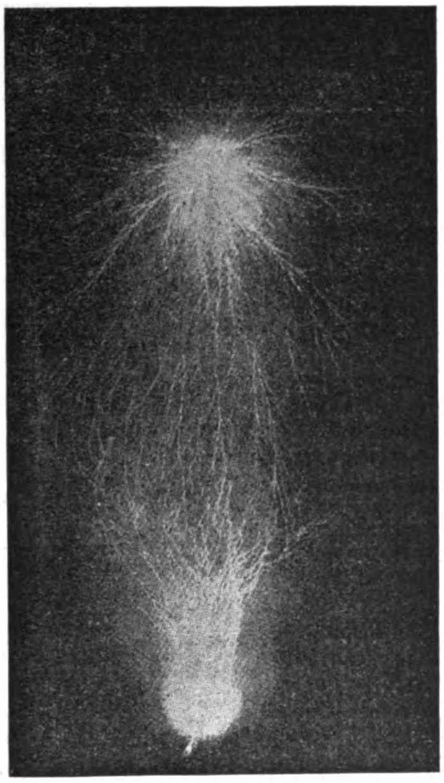

FIG. 10.

The existence of the white core, therefore, may plausibly be attributed to concentration of the current on the surface of the spark, a well-known property of alternating or rapidly varying currents such as we have in the electric spark. The more intense light produced by this stronger surface current may produce reversal of the photograph image, while the less dense current at the center does not reach the reversal point. Fig. 7 shows a discharge containing a dark spark with a white core, which can be seen much better in the enlarged view of the same (Fig. 8). Figs. 9 and 10, however, show how incomplete this explanation of the dark spark is. Fig. 9 is an enlarged view of the horns of part of a brush discharge. The branches of these horns can be seen to overlap or coalesce at several points. The image at these points is brighter, though according to the theory just explained these points ought to be dark owing to photographic reversal. In Fig. 10 we have an effect which as far as we know is quite novel, namely dark points upon white sparks. These dark points occur apparently where the branches terminate in air before they reach the negative pole. This peculiar effect, if photographic, would imply that the points of these sparks were much more luminous than the rest of the spark. But the effect may be electrolytic, as there is always a probability of some electrolytic action when the discharge is made over the surface of the sensitive film of a photographic plate. At the positive end of a spark, oxygen or halogen compounds would be produced by electrolysis, and it is well known that the presence of such compounds in the sensitive film favors reversal of the image. Here, however, they appear at the negative end, and therefore if this theory be correct the dark points must have been produced by a reflected wave of current which temporarily converted the end of the spark into a positive electrode. Fig. 11 represents the effect produced by a discharge from the air upon a negative point. The shape of the horns is said to bear a

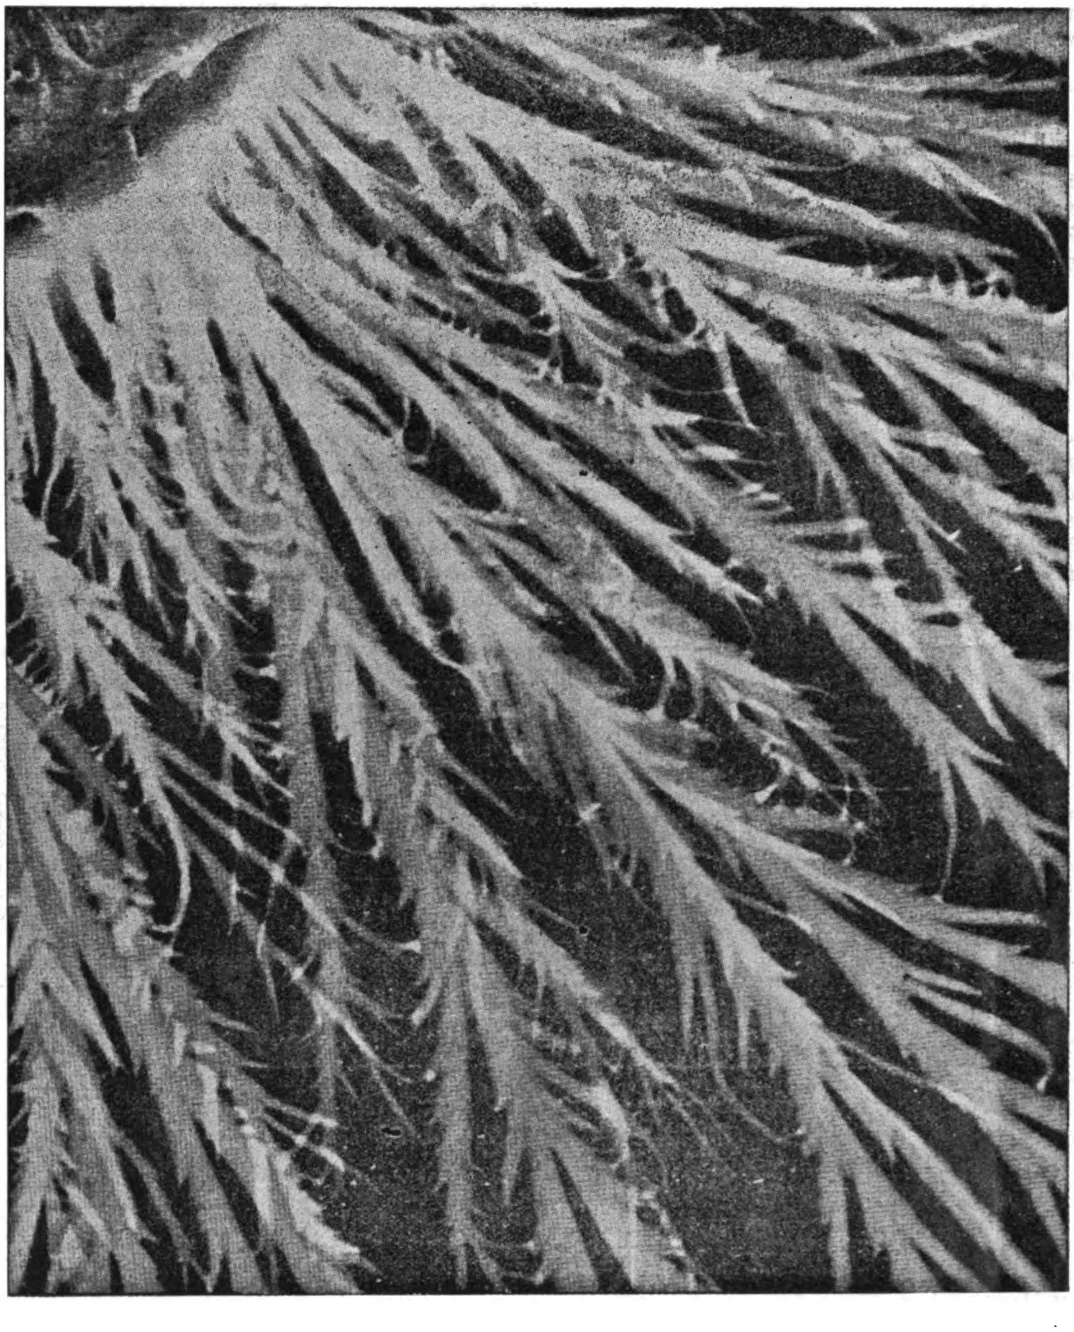

FIG. 9.

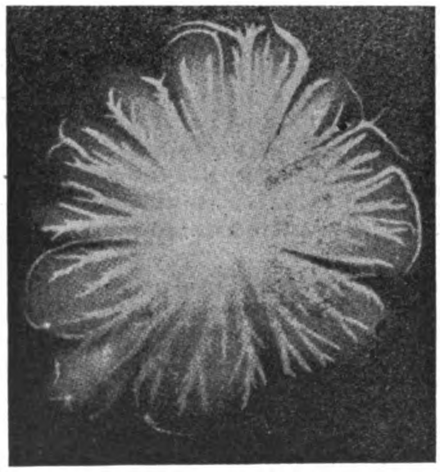

FIG. 11.

---

*Phil. Mag., Vol. XXVIII., page 92, 1889.

very close resemblance to those seen in solar eclipses.

These beautiful figures obtained by Lord Armstrong will, we do not doubt, be of the greatest interest to students of electrical theory, and as a distinguished physicist has remarked, they would be very instructive if we only knew what they meant.

PULL THE STRING.

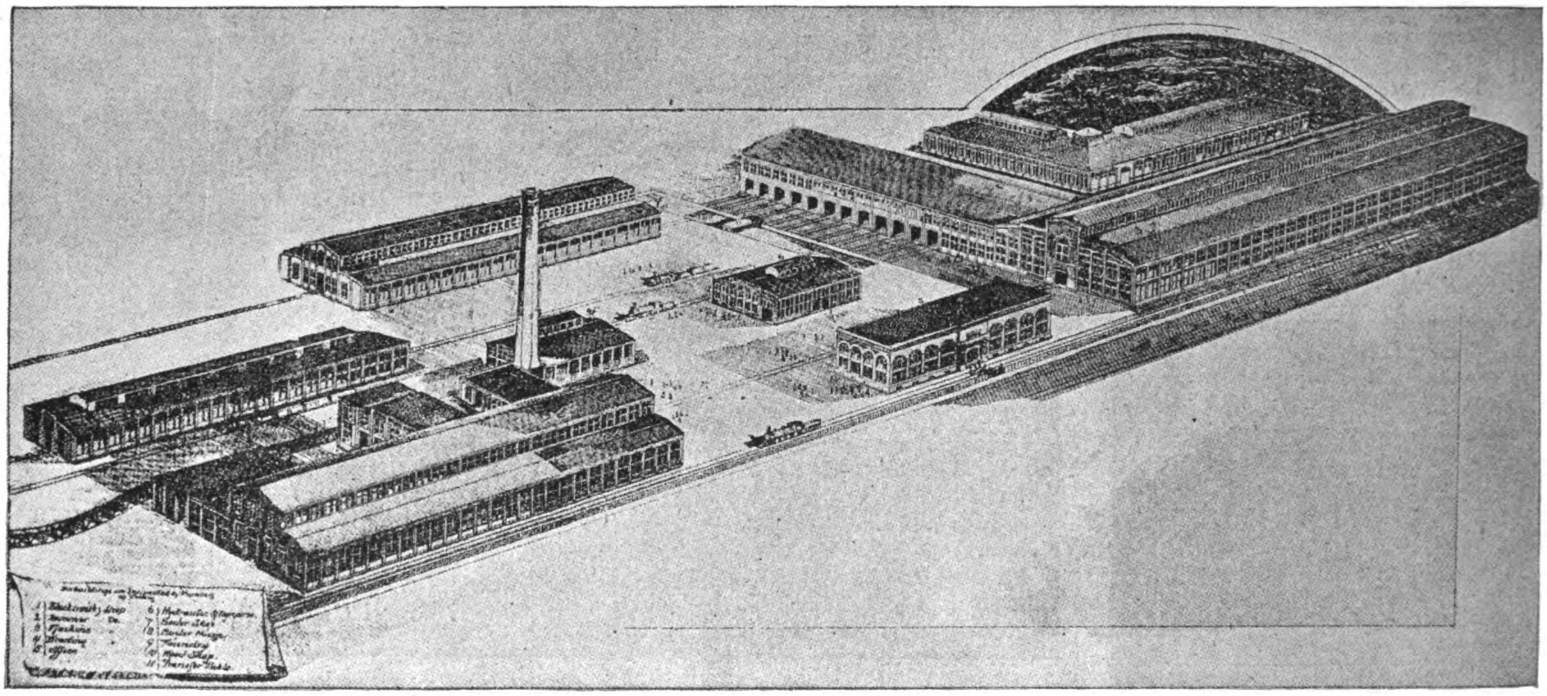
It is too late this time, but hereafter when you get your copy of ELECTRICITY don't break your finger nails or tear the cover of the paper by trying to get the wrapper off in the wrong way. Find a little notch in the wrapper on the right end, pull the string, and you have no trouble.

The Siemens & Halske Co.

Increased Capital—Ready to Extend Their Lines of Manufacture.

The Siemens & Halske Electric Company of America have completed the arrangements which have been under way for several months, and are now finally settled at the old Grant Locomotive Works, Chicago, the purchase of that property having been completed.

The capital stock has been increased from $1,000,000 to $2,000,000, of which $700,000 is preferred and $1,300,000 is common stock. The greater part of the new issue was taken by C. T. Yerkes and his associates. The new issue was oversubscribed by $500,000. In payment for the property the Grant Locomotive Works receive $500,000 in the common stock of the company and 200,000 in the preferred. There is at the present time a mortgage of $217,000 against the property, which, according to the agreement entered into, is to be paid off, the property going to the purchasing corporation free from all indebtedness.



THE SIEMENS & HALSKE ELECTRIC COMPANY'S CHICAGO WORKS.

Sixty two acres of land are comprised in the site of the Grant Locomotive Works, the plant itself having cost $900 000 when erected in 1892. A view of the works is presented herewith, showing their large extent. A better idea of their magnitude can perhaps be had from the following figures: Machine shop, 110x370 feet; erecting shop, 80x285; blacksmith shop, 80x25 ; hammer shop, 80x125; boiler shop, 100x250; wood shop, 70x250; paint shop, 70x170; pattern shop, 60x130; foundry, 80x260; core room, 50x60; cupola, 60x80; boiler room, 50x70; dynamo room, 50x60; office building, 45x130; making a total of 195,260 square feet.

The Siemens & Halske Electric Company of America have not had altogether smooth sailing since their beginning here in 1892, and it is considerable of a personal triumph for Messrs. O. W. Meysenburg and A. W. Wright that in spite of all accidents and unfavorable general conditions they have within three years placed the enterprise in the front rank. The apparatus was well known on this side to technical men, but it was due to the push and energy and business capacity of these gentlemen that the public generally were made aware almost at once of its high character, and that the business took at once so prominent a place. It will be remembered that the plant built in 1892 was completely destroyed by fire in August, 1894. At that time many of the leading railroads and office buildings throughout the country had Siemens & Halske machines in use, and many orders were on the books, some for the largest types of machines. Within six weeks after the fire the company had re-located itself in its present quarters, and had begun to ship apparatus.

At the time of the fire they had several new lines just ready for the market besides Types I. (direct connected) and L. H. (belted). The fire has delayed them seriously, but they are now all ready to proceed with street car motors and other apparatus. Models have been prepared for all these motors, and ELECTRICITY expects to see them on the market by September or earlier.

This news is significant in many ways. Mr. Yerkes is known as one of the most successful railway men in the country. He has controlling interests in many of the systems in our largest cities, and will certainly be a strong man in this enterprise. He has been associated with Messrs. Meysenburg and Wright in many enterprises in the past.

The fact that the president of the Siemens & Halske Electric Company of America is also president of the Wells & French Company, the well-known car builders, will practically enable the Siemens & Halske Company to furnish to customers not only the electric car equipments, but complete cars, including car-body, truck and electrical equipment, all manufactured by themselves or their allied companies.

While the Wall Street bankers are dickering and trading, as pompously as the three tailors of Tooley street, supposing that all they have to do is to agree and then proceed to run the electrical trade of this country to suit themselves, it is cheering news to hear that other capitalists of equal or greater strength ignore them, and proceed in the way of building up a legitimate competing business.

Every additional concern like the Siemens & Halske Electric Company of America is a splendid addition to the strength of the independent forces, and must exert a wholesome influence on the trade as a whole.

Combinations to control will soon be out of fashion.

Obituary.

Henry C. Parmly, senior member of the real estate firm of Parmly Brothers and a member of the Board of Directors of the Standard Electric Company from its inception, died on Thursday of last week. Mr. Parmly was born in Painesville, Ohio, in 1836. In 1860 he went to Paris, and there formed a partnership with his cousin, George W. Parmly, a physician widely known in Europe, and the young firm gradually built up a large practice in medicine and dentistry. Returning to this country in 1873, he was married to Miss Hattie Sumner, daughter of R. B. Sumner, of New Orleans, whom he met while in Europe, and shortly thereafter located in Chicago. Engaging in the real estate business success attended his efforts, and at the time of his death he owned valuable properties in the heart of Chicago. Though of a quiet, retiring disposition, he was a charming companion, a loyal friend, an upright man, a good and progressive citizen.

Chicago Edison Company.

At the recent annual meeting of the Chicago Edison Company the following statement was presented:

Gross income from electric current and merchandise sales		$1,437,042.53
Operating, repairs, renewals and general expenses		953,377.77
Net income from all sources		$483,664.76
CHARGES AGAINST INCOME.		
Interest on bonds and debentures	$155,128.00	
Dividends paid	319,038 21	
		$471,166.21
Balance carried to surplus account		9,498.55
Total		$483,664.76

The old directors were re elected as follows: A. F. Seeberger, John B. Drake, Lambert Tree, E. L. Brewster, R. C. Clowry, Byron L. Smith, Robert T. Lincoln, J. W. Doane, F. S. Gorton, A. A. Sprague, E. M. Phelps, Edson Keith, Samuel Insull.

A. I. E. E.—NIAGARA MEETING.

Since the preliminary programmes of the Niagara Falls meeting of the American Institute of Electrical Engineers were distributed to the members, the Convention rate of one and one-third fare on the certificate plan has been granted by the Central Traffic Association and the Boston Passenger Committee. This, together with the concession of the Trunk Line Association, covers practically all the territory east of the Mississippi River and north of Richmond and St. Louis, conditional upon an attendance of 100 who have traveled by rail to the meeting. Those who expect to attend the meeting, whether members or not, are requested to send their names to R. W. Pope, Secretary, 26 Cortlandt street, New York.

West Shore Railway Arrangements.

For the above meeting the West Shore Railroad has named a rate of a fare and one-third ($10.67) for the round trip from New York City on the certificate p'an; that is, the passenger pays the full rate going, and on stating to the ticket agent that he is a delegate to the above Convention he is furnished with a certificate which, when properly signed and presented to the ticket agent at Niagara Falls, entitles the holder to a ticket from Niagara Falls to New York at the rate of $2.67.

Schedule of train service between New York and Niagara Falls is as follows :

GOING.

Leave New York.		Arrive
Franklin St.	West 42d St.	Niagara Falls.
9:00 a. m.	9:15 a. m.	12:33 a. m.
5:45 p. m.	6:00 p. m.	7:03 a. m.
7:30 p. m.	7:45 p. m.	8:45 a. m.
8:00 p. m.	8:15 p. m.	1:50 p. m.

RETURNING.

Leave	Arrive New York.	
Niagara Falls.	West 42d St.	Franklin St.
8:20 a. m.	10:45 p. m.	11:00 p. m.
5:00 p. m.	7:50 a. m.	8:05 a. m.
8:10 p. m.	10:10 a. m.	10:25 a. m.

ELECTIONS.

The Westinghouse Machine Company.

The annual meeting of the stockholders of the Westinghouse Machine Company was held at Pittsburg on June 10, with a large representation of stock. President Westinghouse was prevented by press of other business from being present. The old officers were re-elected, as follows : President, George Westinghouse, Jr.; vice-president, E. E. Keller, secretary-treasurer, David Jackman. The annual report of the company was favorable, and it was stated that there were numerous orders on the books. The foundation for the new machine shop to be built at the Westinghouse Electric Works at Brinton is almost completed. It is said that between 600 and 700 men will be given employment in the new shops. The other departments of the company are running to their full capacity, and in a number of the departments the employees started on overtime on Tuesday, last week. This is the first time that the men have been working overtime since the works were put in operation.

Phœnix Carbon Company.

The annual meeting of the stockholders of the Phœnix Carbon Manufacturing Company was held on June 11, and the following named gentlemen were duly elected members of the Board of Directors for the ensuing year : Messrs. S. M. Dodd, S. B. Pike, Thos. H. West, J. C. Van Blarcom and James Campbell. The new board met after their election and elected as officers : S. M. Dodd, president ; S. B. Pike, vice-president ; H. L. Page, secretary and treasurer, and S. G. Booker, superintendent. Mr. S. M. Dodd is president of both the Edison Illuminating Company and the Missouri Electric Light and Power Company, and S. B. Pike the secretary and treasurer of both the Edison Illuminating Company and Missouri Electric Light and Power Company of St. Louis; Mr. Thos. H. West is the president of the St. Louis Trust Company; J. C. Van Blarcom is cashier of the National Bank of Commerce in St. Louis, and James Campbell is a well known broker. Mr. S. G. Booker needs no introduction to our readers.

Manhattan Elevated Gossip.

The report from Pittsburg that the Manhattan Railway people have signed a contract with the Westinghouse Company for complete electrical equipment is incorrrect. Those best posted don't expect any such contract to be signed at once.

General News.

What is Going on in the Electrical World.

Goliad, Tex.—Preparations for an electric light plant are under way here.

Stoneham, Mass.—An electric road will soon be constructed from Winchester to Stoneham.

Riverside, Cal.—Bonds are to be issued to supply this city with a first class lighting system.

Wickliffe, Ky.—An electric light plant will be put in here as soon as arrangements can be made.

Madisonville, Ky.—The city council are making investigations as to the cost of putting in an electric light plant.

Winthrop, Mass—A new electric light company is soon to be formed for the purpose of lighting Revere and Winthrop.

Delavan, Wis.—The Delavan Light and Fuel Company are making plans and estimates for an electric light plant for this place.

Worthington, Minn.—At the election held here a few days ago the people voted in favor of a bond issue of $15,000 for an electric light plant.

Waupeca, Wis.—A central plant to furnish heat, light and water will be put in at the Veterans' Home in Waupeca to cost about $10 000.

Windom, Minn.—At the special election held recently a large majority voted in favor of issuing bonds for an electric light plant and waterworks.

Oakland, Cal.—The city electrician is preparing a report on the probable cost of lighting the city hall by electricity as compared with gas.

Milford, Ill.—A company is being organized here to build an electric railway to Onarga or Gilman and possibly to Cissna Park and Boswell, Ind.

Lansing, Mich.—The bill making an appropriation for an electric light plant at the State University, failed to receive the Governor's signature.

La Crosse, Wis.—The La Crosse Electric Street Railway Company have just commenced construction of a four mile extension of their lines to Trotting Park.

Quebec, Can.—At the last meeting of the city council Mr. B emer's application for a franchise for an electric street railway in this city was granted.

Niagara Falls.—The Niagara Falls and Lewiston Railroad Company has been granted a franchise to lay tracks on Third street for their electric road.

Versailles, Ky.—The city council has determined to purchase an arc electric plant for lighting the streets of Versailles, to be owned and operated by the city.

Chicopee, Mass.—The city property committee have decided to petition the council for leave to advertise for bids and specifications for an electric light plant.

Youngstown, O.—The contracts have been let for the construction of an electric railroad from Brier Hill to Niles, and call for the work to be finished sixty days from June 1.

East Orange, N. J.—A canvass is being made in East Orange by John P. Conkling with a view to determining the sentiment of the people in reference to electric lighting.

Chicago.—The Lake Side Elevated Railroad is to be equipped with electricity as a motive power. The West Chicago Street Railroad Company is to furnish the necessary power.

Warren, O.—The North Trumbull Rapid Transit Company has been formed to construct and operate a passenger and freight electric railroad from Farmdale to Mesopotamia, 20 miles.

Oshkosh, Wis.—The Central Wisconsin Electric Railway Company has filed its acceptance of the terms, conditions and obligations governing the extension of franchise granted the company by the common council of Oshkosh.

Laurel, Md.—The Laurel electric light plant has been purchased by a local company, of which Dr. De W. Snowden is president, and has been reorganized under the name of the Electric Company of Prince George's County.

Brookfield, Mass.—One half of the necessary $200,000 of stock of the Southbridge, Sturbridge and Brookfield electric railroad is reported to be subscribed, and the various towns along the proposed line have guaranteed franchises.

Westport, Mo.—An ordinance has been introduced in council granting the Kansas City Electric Railway Company the right to construct and operate an electric light plant in this city and also furnish the city with heating and motive power.

Medina, N. Y.—Charles A. Gorman and John Maher have been appointed a committee to ascertain the cost of the "best system of electric fire alarm that shall come within the reach of the small sum of money appropriated by the village for the purpose."

Monroe, Mich.—A new company has asked the council for a franchise for an electric street railway. Nothing came of a previous grant of a franchise, and the council will need to be assured that the road will be built before granting another franchise.

Niagara Falls.—W. M. Kyle, of Toron'o, has been in the city talking up the project of an international electric railway belt line. Mr. Kyle represents a large number of Canadian capitalists, and is confident that his railroad scheme will ere long be a reality.

Tiffin, O.—Mesch Frost and associates have bought the uncompleted Tiffin and Fostoria electric railway at receiver's sale for $19,784, and state that they will have it completed inside of six weeks. No bids were offered for the Tiffin electric and horse car lines.

Fort Worth, Tex.—The Dallas and Oak Cliff Rapid Transit Electric Railway is to be extended to Fort Worth. The line will be operated by electricity and two power houses will be needed. The purchasers of the Dallas line at its late sale are the parties who have the enterprise in hand.

Lockport, N. Y.—Charles A. Johnson, of New York, president of the Lock City Electric Railroad Company, advocates the building of an electric railroad to connect Buffalo and Olcott, via Williamsville, Swansville and Lockport. He is willing to put up two-thirds of the money to build the line to Olcott.

Louisville, Ky.—A movement is on foot to build an electric railroad from Louisville to Fairfield. W. F. Carrithers, F. O. Carrithers, Lafe DeWitt, J. G. Queen, W. P. Stalliger and J. C. Wright, all living along the proposed route, were appointed a committee at a meeting held here to put the matter before the public.

Webb City, Mo.—The Fitch Electric Railway will be completed from Webb City to Carthage, Mo., by July 15. This will give Carthage electric connections with Joplin. The line now running from Webb City to Joplin will be extended to Galena, Kan. This will make twenty-six miles altogether.

Owensboro, Ky.—This city has been contemplating the building of an electric light plant, but the recent decision depriving cities of the bank tax will make it necessary that the proposed undertaking be laid over unless bonds are issued. The city council has advertised for bids for lighting the city.

East Liverpool, O.—Pittsburg and Eastern capitalists have under consideration the building of an electric road between this place and Salem, via Lisbon; the length of the line proposed is about 35 miles. A. R. Mackell, of East Liverpool, accompanied a party of capitalists over the proposed route a few days ago, and considers the project a feasible one.

Augusta, Ga.—Roby Robinson, Robert F. Shedden and J. H. Gilbert have filed a petition for a charter for the Southern Electric Development Company. The capital stock is named at $10,000 and the privilege of increasing it to $500,000 is asked for. The company is formed for the purpose of dealing in and manufacturing electrical appliances.

Catonsville, Md.—It is understood that arrangements have been completed whereby the Catonsville Short Line Railroad, a branch of the Baltimore and Potomac Railroad, will pass under the control of the Edmonson Avenue, Catonsville and Ellicott City Electric Railway Company which constitutes a portion of the Baltimore and Washington Boulevard Electric Line.

St. Louis, Mo.—The Hausman system, a series of electric roads, forming an almost complete network among the county towns, promises to be built soon. The right of way will be over property deeded to the company, and therefore cars can be run at high speed. Heavy motors will be used, as the projectors are determined to compete with the steam railroad.

Little Falls, N. Y.—The electric railroad project which proposes to connect this place with Richfield Springs is receiving encouragement. The local people interested are Messrs. Tylee & Viele, Victor Adams, Homer Snyder and others. Senator Bates of Massachusetts is the leading capitalist connected with the enterprise.

Boston.—The Gas and Electric Light Commissioners have just approved an issue of $25,000 new stock by the Rawson Light and Power Company, which is a reorganization of the Leicester Electric Company. A similar issue of new stock by the Nantucket Electric Company, a reorganization of the Nantucket Electric Light Company, was also approved.

Cincinnati, O.—It is proposed by the Supervising Architect, Wm. Martin Aiken, to enlarge the capacity of the electric light plant in the Federal Building here so that gas can be dispensed with entirely. The gas bill for the building reaches nearly $5,000 per annum and a first-class electric plant at a cost of between $15,000 and $20,000 would soon pay for itself.

Richmond, Va.—The common council has passed the ordinance granting a franchise to the Richmond Conduit Company for an underground trolley railway from Chimborazo Park to the Boulevard on Broad street.—The Manchester Street Railway Company has applied for permission to change the motive power on one of its lines to electricity.

Brookhaven, Miss.—An improvement company has been organized here with a capital stock of $200,000 by the following well-known business men of Brookhaven: W. H. Seavy, J. W. McGrath, Louis Cohen, A. E. Morelon, E. Bowsky and F. F. Gecker. Their object is to establish a cotton compress, cotton warehouse, canning factory and electric light plant.

Marion, O.—The Marion Water Company has been organized to establish water, gas and electric light works in this city. The capital stock is $250,000. The directors are Charles J. Chapman, Cullen C. Chapman, Chester H. Pease, Robert Chapman, Newman Earl of New York, E. E. Pratt of Boston and C. E. Burke of Cleveland, O. C. C. Chapman is president and C. J. Chapman treasurer.

Birmingham, Ala.—The *Age-Herald* says the Birmingham Railway and Electric Company has the biggest electric car south of the Ohio River. It is named "Picnic," and will be mounted on four motors. It will seat 100 people. It is painted in red and gold, and is by long odds the handsomest car ever run in Birmingham. It is designed to work the picnic travel and will be chartered to private trolley parties. The railway company have arranged to give sacred concerts at Avondale Park every Sunday afternoon.

Dover, N. H.—The directors of the Wells Beach and Ogunquit Electric Railroad Company have perfected their organization as follows: William H. Eaton, of Wells Beach, president; Charles W. Tibbetts, of Dover, vice-president; Thomas G. Jameson of Somersworth, treasurer, Walter D. Davis, of Wells Beach, clerk; William H. Eaton, Charles W. Tibbetts, Josiah Chase, Oscar J. Hubbard and William F. Cousins, executive committee.

Saratoga, N. Y.—The board of street commissioners has granted to Dennis B. Hill, of Greenwich, Washington County, a franchise for erecting poles in the streets of the village and wiring them for electric lighting and also for lighting public buildings and commercial lighting. It is reported that Mr. Hill is connected with the United Gas and Electric Light Company, which has secured the contract for lighting the village from August 15 next.

Staten Island, N. Y.—The trustees of the village of Edgewater have granted to the Staten Island Electric Railroad Company the right to change the motive power upon the old Belt Line Company's route from horses to electricity. The Staten Island Electric Company has already laid some of its track in New Brighton, and work upon the power plant, which is being erected at the foot of Jersey street, New Brighton, is progressing rapidly.

Troy, N. Y.—Work on the Troy and Sandlake Railroad has begun. The Westinghouse Electric and Manufacturing Company of Pittsburg was given the contract for the motors for the cars and the generators for the power station. The motors will be forty horse power each and there will be two on each car. The style of car has not been decided upon, but they will be heavier and longer than those of the Troy City Railroad.

Stafford Springs, Conn.—The Rockville, Stafford and Southbridge electric railroad has been organized and the following officers elected: President, William B Ferguson of Malden, Mass.; treasurer, Charles C Davison of Lewiston, Me.; secretary, R. S. Hicks of Stafford Springs; directors, the above and Charles E. Baua of Plymouth, Mass., A. L. Patten of Lewiston, Me., and F. E. Low of Greenfield, Mass. The stock has been taken up and it is proposed to build a road at once from the Springs to Staffordville.

Burlington, N. J.—A second test by the Pennsylvania Railroad Company of the Westinghouse electric system on the Burlington and Mt. Holly branch has been made since our last report, and a speed of forty-two miles an hour attained. With two standard cars attached thirty miles an hour was reached. There was no flashing on the trolley wires at the highest rate of speed attained. The second motor car, to be fitted with larger motors, is designed to attain sixty miles an hour, and experiments so far indicate that no difficulty will be experienced in running at this high rate of speed.

San Francisco, Cal.—The *Call* says: "The San Francisco Gas Light Company has discovered that the electric light is affecting its revenue, and that if it wishes to keep in the front ranks of progress it will have to add an electric light plant to the one used for furnishing gas to the citizens. For some time past the officers of the company have been engaged in studying the electric light problem, and in an informal way they have decided that they ought to have a plant to furnish the new light. Without estimates they came to the conclusion that such a plant as they require would cost about $2,000,000."

Philadelphia.—The new trolley line to Haddington has been opened to travel. The trial trip assumed the character of an ovation, some of the principal citizens participating; men, women and children turned out, waved flags and pocket handkerchiefs and cheered heartily the advent of the trolley into the hitherto inaccessible portions of West Philadelphia. Magistrate Peter J. Hughes, who was the projector of the new line, was a conspicous figure on the trip and he was the recipient of numerous floral offerings from admiring friends along the route of the new railway.

Albany, N. Y.—The State Railroad Commission will consider the following applications June 25: of the Raquette Lake Railroad Company for a certificate under section 59 of the railroad law, authorizing it to construct a road in the Adirondacks; of the Rome City Street Railway Company to change its motive power to electricity.—The board of trustees of public buildings has approved the contract made with the Municipal Gas Company of Albany for the gas and electric lighting of the capitol and executive mansion at $30,000 a year for three years. The cost of gas and electric lighting last year was $39,688.82. The present contract requires that 3,800 incandescent lights of 16 C. P. each and 54 arc lights, each of 2,000 C. P. shall be furnished, with all repairs, supplies and maintenance.

Buffalo, N. Y.—Jacob Busch and Thomas Murphy have applied to the common council for the right to handle electric power. They have undertaken to form a company with a subscription list of $1,000,000. Of this they say $100,000 has been subscribed, and if the franchise is granted they have assurances that if it is necessary $5,000,000 will be subscribed for the purpose of this enterprise. The petitioners ask the right, privilege and franchise to erect poles, lay conduits and string wires in any and all of the streets, alleys and squares of the city of Buffalo, for the purpose of supplying light, heat and power. They want the privilege of obtaining power from any company, firm, person or persons engaged in transmitting electricity in Buffalo, Niagara Falls or elsewhere and to be allowed to connect wires for the purposes of such electrical transmission. The petition sets forth the purpose of the new company to be to go to Niagara Falls if necessary and bring power to Buffalo.

Washington, D. C.—It is reported that arrangements have been completed for building the long delayed boulevard road between this city and Baltimore.—The Washington and Great Falls Electric Company has secured permission to issue $500,000 in bonds to build its road. The line is about 6½ miles long and the trolley system will be used. Stilson Hutchins is president of the road.—A number of gentlemen who are interested in the development of the power at Niagara propose visiting Great Falls, on the Potomac, to make investigations as to the facilities afforded at that point for manufacturing enterprises. The power obtainable is sufficient to operate a large number of works through the agency of electricity.—P. A. B Widener, Wm. L. Elkins and Thomas Dolan have disposed of all their interests in the Washington City street railways to the Maryland and Columbia Electric Railway Company, which is to build an electric road between Baltimore and Washington. The gentlemen named are also heavily interested in the latter company, and they sold out their Washington interests to enable the new company to secure proper terminals in that city.

Baltimore.—The *American* says: "The narrow-gauge tracks of the Baltimore and Lehigh Railroad and the York Southern, which is that part of the system lying within the State of Pennsylvania, will shortly be converted into a standard gauge road, and not unlikely into an electric line as well, using the heavy and powerful trolley instead of the steam locomotive. Mr. Blackwell, the electrician, who went over the road a few days ago with an inspection party, will make his report to the executive committee at the earliest possible moment. The question of electrifying the road will then be taken up, and if it be found that the line can be operated to advantage by the new method, the change will be made without delay, and will go into effect when the work of broad-gauging the road shall have been completed."—One of the electric locomotives for the Belt Line Railroad has arrived here from Schenectady. It is proposed after completing all arrangements for regularly running the electric locomotives through the tunnel to have a formal opening, to which President Cleveland, the diplomatic corps and other distinguished persons are to be invited.

Telephone and Telegraph.

The city council of Lincoln, Neb., has granted to George D. Sheibley a franchise for an underground telephone service. Six hundred subscribers have been secured. The Kurtz system will be installed.

The Citizens' Mutual Telephone Company, Decatur, Ill., organized three years ago by W. J. Kurtz, of Vandalia, Ill., has sold its plant to a syndicate for $9,448.

A fifty-year telephone franchise has been granted to W. J. Kurtz, of Vandalia, Ill.

The La Crosse Telephone Company, La Crosse, Wis., has contracted with Miller & Dolan, of that place, for the setting of 1,000 poles, work to be completed by July 10th. Wire stringing will commence at once. The company has purchased all the necessary material except telephones, and is in the market for 500 instruments and switchboard.

At Boston on the 12th inst. the Bell Telephone directors declared a regular dividend of 3 per cent. and an extra one of 1½ per cent., payable July 15 to stock of record June 29. They also called a stockholders' meeting for June 24, to act on a recommendation to issue $1,000,000 additional stock. The outstanding capital is now $20,500,000. The new stock must be offered to shareholders at a price to be fixed by the Commissioner of Corporations, and any unsubscribed balance must be sold by auction.

The long-distance telephone line between Columbus and Rome, Ga., will be completed in a week or ten days.

J. A. Clason and others have organized the Eureka Telephone Company at Neosho, Wis.

A local telephone exchange has been established at Lisbon, Minn. Connection will be made with nearby places.

The Standard Telephone Company will soon begin work at St. Paul and other Minnesota towns.

The work of constructing a telephone line connecting Carbondale, Ind., and Murphysboro, has begun.

The Standard Telephone Company has just completed a telephone system in Tomahawk, Wis. The company uses the French Milde system.

M. B. Rice, superintendent of the Telephone and Construction Company of Tallahassee, Fla., has applied to the city council of Jacksonville, Fla., for permission to establish a telephone exchange in Jacksonville, to compete with the present exchange.

The new Capital Telephone and Telegraph Company of Sacramento, Cal., has ordered 700 telephones from a New York telephone company.

A factory to manufacture telephones for the Pana Company has been located at Elwood, Ind., which will be the headquarters of the company.

A telephone line is being constructed from Clifford to Columbus, Ind., tapping Hartsville, Newberne, Hope, St. Louis Crossing, Flatrock, Petersburg and Nortouberg.

George W. Cross, the Baltimore agent of the Standard Telephone Company, has put solicitors at work securing subscribers in that city for a telephone system, which it is proposed to operate in opposition to the present Bell system, and at much lower rates for both local and long distance service.

The Wisconsin Telephone Company finds it rather distasteful to reduce its rates at Milwaukee, but promises—if the citizens are good enough to give it increased patronage—to do so about the 1st of July. One of the directors intimates as much in this statement made to a representative of the *Sentinel*: "However, the rates will be reduced, and the question with the directors only is, whether the reduced rates would stimulate the use of the telephone sufficiently so as to make up for the loss which the directors feel certain will result from the reduction." A lively competing company at Milwaukee is the stimulant the directors are most in need of, and the citizens too.

In accordance with the ordinance of councils of Philadelphia, the Automatic Telephone Company has filed a bond with the city for $87,000. Among the names on the bond is that of the Integrity Title Insurance Trust Company. The Automatic Company was recently granted a franchise to operate in Philadelphia.

At a meeting of the New York Board of Trade on the 12th inst. the report of the Telephone Committee, reciting the diligent but fruitless efforts at Albany for cheaper telephone service, was submitted. The report intimates that improper means were used to influence votes, and suggests unity in measures to defeat the renomination of all Senators and Assemblymen who were against the Telephone bills.

The Postal Telegraph Company has petitioned for a right of way through Madison County, Ind., the proposed line from Richmond to Chicago passing through Anderson, Frankton and Elwood.

E. C. Hein has obtained a franchise for a telephone exchange at Statesville, N. C.

Residents of Lake Odessa, Clarkville, Sunfield, Mulliken and Freeport, Mich., have organized a stock company and put in a telephone line connecting the five villages.

An ordinance has been submitted to the board of aldermen at Louisville, Ky., authorizing the American Telephone and Telegraph Company of Kentucky to use the public streets of Louisville for the purpose of placing poles and electrical conductors thereon and subways for electrical conductors under the same.

The California Telephone and Construction Company of San Jose, Cal., has secured contracts for about all of the independent exchange work in that section. This company is installing an exchange system at Sacramento and is making preparations to extend the service to all parts of the State. Three year contracts are being made with subscribers. In Sacramento and San Jose nearly all of the Bell Company's subscribers have decided to take the service of the new company. The Bell Company has commenced to reduce rates outside of San Francisco and is about to cut rates there to meet competition.

The Southern Telephone and Construction Company and the Telephone and Electric Specialty Co. have been succeeded by the Florida Telephone and Construction Company, recently incorporated at Tallahassee, Fla. The officers of the new company are as follows: Jas. D. Randall, president; W. A. Rawls, vice-president; J. W. Saxon, treasurer; M. B. Rice, secretary. The company will have offices in Tallahassee, Fla., and Memphis, Tenn., and will engage in telephone construction work for both exchange and interior purposes.

COMMERCIAL PARAGRAPHS.

"Interesting Facts" is the title of a booklet that is being distributed by the New York and Ohio Company, Warren, O., manufacturers of the "Packard" Lamp. The title is no misnomer, for the pamphlet tells in an interesting way many facts about incandescent lamps in general and the "Packard" in particular. The performance of the "Packard" Lamp is shown by curves of candle power and efficiency and by curves of comparison. The book tells what a high efficiency lamp really is, as well as other things lamp users need to know.

A part of the latest catalogue and price list of carbon products issued by the Crouse-Tremaine Carbon Company, Fostoria, O., is devoted to the subject of Cored Carbons, in which the following announcement is made: "We are happy to say that we have succeeded in producing a cored carbon fully equal to the best foreign make, which we are selling at a price lower than the importers can afford to make." Cored carbons are made by this company for both high and low potential arc lighting.

The "fin de siecle" catalogue of general electrical supplies issued by the E. S. Greeley Company, 5 and 7 Dey street, New York, is one of the most elaborate works in this line that have been produced. The book embodies 560 closely compiled pages and 2,000 illustrations.

The most recent catalogue issued by the Emerson Electric Manufacturing Company, St. Louis, is devoted to the "Meston" alternating current motors. The text and illustrations make quite plain all the good points of this company's products.

The Sulzer-Vogt Machine Company, Louisville, Ky., long time manufacturers of hydraulic elevators, have added an electric department and are now producing a complete line of electric elevators. A supplementary catalogue, recently issued, is devoted to this department.

The Brady Manufacturing Company, Brooklyn, N. Y., has issued a circular calling attention to its facilities for manufacturing special tools and fixtures and interchangeable metal parts of every conceivable design, and for every possible purpose.

A Promising Industry.

(Fom the Minneapolis Journal.)

The Indianapolis Electric Company, manufacturers of long-distance telephones, annunciators, batteries, magnets, bells, switches, transmitters and receivers, are greatly encouraged over the volume of their business which is increasing daily. Their long-distance telephone is now in use on the Belt road, the Union tracks, by the Indianapolis Natural Gas Company between Indianapolis and Elwood, and a number of the coal operators in Clay County are using this telephone. The Big Four has adopted it on portions of its system. On Saturday the establishment was four hundred behind in orders for telephone instruments.

The Law Battery Company.

The Law Battery Company, manufacturers of batteries, electro-therapeutical apparatus, carbons, battery materials and a line of electrical specialties, have recently erected a new factory at Cranford, N. J. The building is 50 by 100 feet, and is fitted throughout with new and improved machinery. With increased manufacturing facilities the company is now able to meet all requirements and to fill all orders promptly.

A forty-eight page catalogue has just been issued describing in detail all the products of this company. The New York office of the company has been removed to 39 Cortlandt street.

"Economy Guarantees of Engines."

The above is the title of a neat little pamphlet issued by the Westinghouse Machine Company, Pittsburg, manufacturers of the well-known Westinghouse engines.

This company takes pardonable pride in the fact that its business has been conducted upon lines of open statements of facts that the customer might be fully and correctly informed.

The faith of the manufacturers in their product is forcibly shown by the following proposition which is offered to all intending purchasers:

"Any purchaser, so desiring, is welcome to have his engine tested by his own expert at our shops before shipment and may accept or reject the engine on that test before incurring the expense of installation."

Street Lighting.

Nations may be ungrateful, but the chief officials in our Western cities are not so constituted, judging from a letter received by the Standard Electric Company, Chicago, from which we extract the following: "The (Standard arc) dynamo we bought of you has been in constant use in all-night service since November, 1893, and has not cost one cent for repairs. I find it more economical to operate —in the amount of power required—than any other dynamo we use.

A Breeze From the City of Wind.

There is always a refreshing air about the printed matter that comes from the advertising department of the Central Electric Company, Chicago. It is therefore to be expected that a circular devoted to fan motors would be a breezy production. Circular No. 20, just issued, enjoys that distinction while it serves the useful purpose of telling to what good uses the Lundell Fan Motor can be put.

BUSINESS HINTS.

Public Buildings, Theaters, Residences, &c., Proposed or in Course of Construction.

[The following summary is prepared weekly for ELECTRICITY for the information of advertisers and readers who are dealers in apparatus and articles required in the electrical equipment of public and private buildings.]

Allegheny, Pa.—Thomas McKee, son of H. Sellers McKee, will erect a dwelling on Ridge ave. at a cost of $60,000; handsome interior finishing.

Austin, Tex.—Geo. W. Littlefield has purchased the Driskall Hotel, and will enlarge it and add an opera house.

Baltimore.—Thomas Gordon, proprietor of the Rose House, has purchased a site on North Eutaw st., and will erect a hotel, restaurant and roof garden combined. ....Frank E. Ewell is building one of the finest residences in this city, in Eutaw Place: it will be lighted by electricity throughout, Architect J. E. Laferty.

Brockton, Mass.—Dr S. J. Gruver, John W. Hall, C. D. Bridgeman, F. B. Gardner and Embert Howard are the construction committee of the new First Congregational Church, Main and Pleasant sts.

Brooklyn, N. Y.—A music hall is to be erected at Alabama and East New York aves., Architects J. B. McElfetrick & Sons, 1193 Broadway, New York.....Memorial Hospital for Women and Children has obtained leave to borrow $70,000 to complete its new buildings, Prospect Place and St. Mark's ave.

Buffalo, N. Y.—Hotel to be built on the grounds of the International Assembly at Crystal Beach: President, W. H. Main.....Rung Bros., furniture dealers, will build five story brick apartment house, south side of Glenwood ave., east of Main st., Architect A. E. Koehn.

Boston, Mass.—Wm. A. Miller will erect a six story block at Elliott and Pleasant sts., according to plans drawn by Architect Patrick A. Tracy; electric elevators; heated throughout by steam.

Charleston, W. Va.—Hon. W. A. McCorkle will receive bids for a four story hotel. Electric lights, steam heating, street, passenger and freight elevators, steam power.

Hartford, Conn.—Hartford is to have an $80,000 theater.

Lebanon Springs, N. Y.—Lebanon Springs Company incorporated to conduct a hotel and mineral water business in Lebanon Springs, Columbia County; capital stock, $300,000. Directors: John H. Fife and F. H. Herron, of New York City, and Issac Smith, of Brooklyn.

Little Falls, N. Y.—The project of building a new city hall is being discussed.

Medway, Mass.—The building erecting by W. B. Hodge is to be fitted up with electric lights.

New York City.—H. O. Havemeyer has definitely decided the style and size of his new buildings to be erected at Prince and Ann sts. The structure for the latter corner is to be a tower-shape structure of 25 stories, fire-proof throughout and contain latest modern office building equipments, elevators, electric lighting and steam heating....Plans are being prepared by Architect George B. Post, 33 East 17th st., for two fire-proof buildings, twelve stories in height, at the northeast cor. of Prince st and Broadway; power plants and machinery will be placed in the basements; the buildings will be steam heated and lighted by electricity....The six story mercantile building to be erected by Andrew H. Smith, at 20 East 42d st., will be lighted by electricity. ....The mercantile building to be erected for the estate of J. C. Ayer, cor. Leonard st. and Broadway, at a cost of $150,000, will be lighted by electricity, Architect Robert Manicke, 33 East 17th st ....Plans have been filed for a $70,000 addition to the Imperial Hotel, Broadway and 32d st....A seven story warehouse and laboratory will be erected southwest cor. of University and Clinton Places, for A. & S. Hirsch, Architect Alfred Zucher, 33 Union Square West....Plans have been filed for a 4-story building to be erected as an annex to the Roosevelt Hospital, 59th st., to cost $150,000.....The Five Points House of Industry, 155 Worth st., will be enlarged by the erection of a fire-proof building to accommodate five hundred children, to cost $100,000. W. F. Barnard, Sup't..... 2 four story brownstone dwellings, 34-36 West 72d st., Architects Thom & Wilson, 1267 Broadway; 5 five story dwellings, north side of 85th st., west of Boulevard, also 4 similar houses, south side of 86th st., east of West End ave., Architect C. H. P. Gilbert, 18 Broadway; 2 five story flats north side of 87th st., west of Amsterdam ave., by James Buckley; five story brick tenement, southwest cor. of Stanton & Willett sts. by Fay & Stacom; sixteen story brick office building, 63-65 Wall st., Architects Clinton & Russell; five story office and flat, northeast cor. of 92d st. and 3d ave., by George Ringler & Co.; six story brick store and offices, at 20-22 East 42d st., by Andrew H. Smith, 15 East 38th st.

Newark, N. J.—J. H. Bonnell & Sons will erect a business building at 196-198 Market st., seven stories, heated by steam, lighted by electricity. Architect Thos. Cressy.

Niagara Falls.—Theatre to be erected on the site of the Park Theatre Architects Leon H. Lamport & Son, Rochester, N. Y.

North Tonawanda, N. Y.—Edward Evans has announced that he will shortly begin the erection of a new opera house in North Tonawanda, seating capacity 1,200.

Philadelphia, Pa.—J. Clark Moore, Jr., will erect 9 four story houses, with Pompeiian brick fronts, on Spruce st., west of 40th....Architects Rankin & Kellogg have finished the plans for the 2d Regiment Armory to be erected on Broad st.....Architect Thomas Bennett is preparing plans for a nine story office building to be erected in the center of the city....Architect J. B. Colesberry is receiving estimates for a handsome residence to be built at Melrose for Mrs. Wm. H. Lorimer; it will have electric lighting and every modern improvement....Work will soon begin on a handsome house for Benjamin P. Opedyke, on northwest side of Drexel ave., near 49th st....It is expected that the contract for the erection of the proposed Augusta apartment house, at 6th and Spruce sts., will be let soon, Architect Willie G. Hale.

Richmond, Va.—Edgerton Rogers has completed plans for a projected theater and hotel building.

Rochester, N. Y.—Sidney B. Roby will erect a five story manufacturing building at West Main and Elizabeth sts. Architects Charles S. and Harvey Ellis.

Roxbury, Mass.—Architect C. F. Clark has prepared plans for a $100,000 apartment house on Humboldt ave., for E. D. Bell. The structure will accommodate eighteen families.

Savannah, Ga.—Architect Frank Cox has announced that the erection of a new theater at this place will be commenced at once.

Syracuse, N. Y.—Architects Benson & Brockway, 55 Broadway, New York City, have prepared plans for a new building to be erected for the Medical College and Syracuse University. The structure will be four stories, the basement to contain dynamos, elevator machinery, boiler room, machine shop, cold storage room, etc.

Pittsburg, Pa.—A company of Pittsburg capitalists are said to have secured ground on Forbes st. and will erect a hotel to cost $800,000.....G. D. Simen has plans under way for a twelve story store and office building to be erected on Grant st....James McNally will erect an eight story business block on Penn ave., Architect P. D. Evans.

Wheeling, W. Va.—The Exchange Bank will erect a bank building.

Windsor, Ont., Can.—St. Andrew's Presbyterian Society will build a brick and stone Sunday-school and church at Victoria and Park ave., to cost $25,000, electric work, etc. Architect Wm. C. Rohns, 1113 Chamber of Commerce, Detroit, Mich.

INCORPORATIONS.

The Chicago Electric Light Enlarging Company, Chicago, has certified to an increase in capital stock from $5,000 to $15,000.

The Allegheny Power Company, Pittsburg, Pa.—to supply light, heat and power by means of electricity. Capital stock, $1,000. Promoters: H. W. Mitchell, Pittsburg; Wm. H. Dodds, Chas. F. Patterson, Allegheny, Pa.

The South Shore Street Railway Company, Erie, Pa.—to build an electric street railway in North East, Pa. Capital stock, $100,000. Promoters: L. J. Chase, Buffalo, N. Y.; E. M. Ketcham, Frank McLaughlin, North East, Pa.

The Chatham Electric Light, Heat and Power Company of Chatham, Columbia County, N. Y. Capital stock, $10,000. Directors: John F. Farrell, of Albany, and H. M. Francis and J. O. Carr, of Schenectady.

The Erie and Eastern Street Railway Company, Erie, Pa.—to build an electric street railway in the city of Erie. Capital stock, $25,000. Promoters: Harry L. Moore, F. F Curtze, C. M Conrad, Erie.

The Erie, Reed Park and Lakeside Street Railway Company, Erie, Pa.—to build an electric street railway in Erie. Capital stock, $50,000. Promoters; Chas. M. Reed, F. F. Curtze, Harry L. Moore, Erie.

The Franklin Company, Pittsburg, Pa.—to supply light, heat and power by means of electricity. Capital stock, $1,000. Promoters: H. W. Mitchell, Chas. F. Patterson, Pittsburg; Wm. H. Dodds, Allegheny.

The Springfield, Clifton, Cedarville and Jamestown Electric Railway Company, Xenia, O.—to build and operate an electric railway from Springfield through towns named to Jamestown. Capital stock, $100,000. Promoters: John B. Stevenson, G. A. McKay, A. C. Carpenter, R. R. Knowles, R. F. Kerr, T. L. Magruder, of Xenia.

The Greenville Light Company, Greenville, Ohio—to manufacture and supply light, heat and electricity for public and private use. Capital stock, $5,000 Promoters John P. Martin, Chas. Darlington, E. M. Milton, M. A. Broadstone, of Xenia, Ohio.

The Carthage Electric Telephone Company, Carthage, Mo.—to erect and maintain telephone lines. Capital stock, $5,000. Promoters: Theo. J. Clark, E. C. Clark, Geo. W. Wheeler, E. R. Wheeler, Carthage.

The Hillsboro Street Railway Company, Hillsboro, Tex.—to operate street railway in Hillsboro. Capital stock, $15,000. Promoters: R. J. Ware, H. W. Carter, S. E. Carter, all of Hillsboro.

The Pressley Single Track Electric Railway Company, San Francisco, Cal.—to purchase, own, use and sell United States patents for electro-magnetic safety railways; grant to others the right to use and buy inventions. Capital stock, $[illegible]00,000. Promoters: L. C. Pressley, J. C. Rhoads, J. O. Jephson, C. S. Wheaton, W. F. Oecling, San Francisco.

The Hammond and Blue Island Railway Company of Indiana (incorporated in Ind.), Chicago, Ill. Capital stock, $80,000. Promoters: Edw. S. Whitney, Fred'k B. Fuller, James T. Maher, Ralph Martin.

The Cairo and Catskill Telephone Company—to connect Cairo, Catskill and other near-by places. Capital, $500. Directors: F. G. Walter, A. V. Decker, H. S. Duncan, J. Leroy Jacobs, Selden H. Hines, John K. Palen and Solon W. Stevens, of Cairo, N. Y.

The Trumansburg Electric Lighting Company of Trumansburg, Tompkins County, N. Y Capital stock, $10,000. Directors: C. C. Sears, A. S. Mosher, James H. Smith and O. G. Noble, of Trumansburg.

A charter has been issued by the State Department at Harrisburg, Pa., to the Buffalo and St. Marys Railroad Company, capitalized at $300,000, to build a line from St. Marys, Elk County, to Clermont, McKean County, Pa., a distance of thirty miles. President, Andrew Kaul, St. Marys. Directors: B. Frank Hall, B. E. Wollendorf, John Kaul, G P. Simons, J. M. Schaefer, St. Marys, Pa.; J. K. P. Hall, Ridgway.

The Central American Development Company, San Francisco, Cal.—to build steam and street railroads, electric cables, etc. Capital stock, $1,000,000. Promoters: C. T. Thomas, A. Ballin, San Francisco; Frank A. Woodworth, Santa Barbara, Cal.; M. Cassin, Salvador, C. A.

The San Jose Lighting Company, San Jose, Cal.—to construct and operate works, plants and systems for the manufacture of gas and electricity for light, heat, power; build pipes, mains, flumes, lines, etc., for transmission of electricity. Capital stock, $250,000. Promoters: Chas. F. Wilcox, Jos. R. Patton, Wm. H. Sumner, San Jose.

The Little Falls Street Railway, Little Falls, N. Y.—to build and operate an electric surface road. Capital stock, $75,000. Promoters: W. H. Tylee, Worcester, Mass.; C. L. B. Tylee, J. L. Miller, F. H. Viele, Corning, N. Y.

The Freemansburg Electric Company, Freemansburg, N.Y.—to manufacture and use electricity. Capital stock, $10,000. Promoters: C. C. Sears, J. H. Smith, O. C. Noble, of Freemansburg: C. S. Wixom, Covert, N. Y.

The Buffalo, North Main Street and Tonawanda Company, Buffalo, N. Y.—to operate the Buffalo, North Main Street and Tonawanda Electric Railroad Company. Capital stock, $75,000. Promoters: S. W. Petrie, T. H. Feeney, J. H. Pardee, Buffalo; J. F. Farrell, Albany, N. Y.

The Bridgton and Harrison Electric Company, Bridgton, Maine—to make, generate and distribute electricity for heat, light and power. Capital stock, $10,000. Promoters: Geo. P. Locke, Norway, Me.; Chas. E. Geason, Chas. A. Scribner, Bridgton.

The Penn Electric Light, Heat and Power Company, Reading, Pa.—to manufacture and supply light, heat and power by means of electricity. Capital stock, $100,000. Promoters: John P. Bechtel, Chas. N. Frame, Milton H. Schnader, Reading.

The Automatic Circuit Breaker Company, Newaygo, Mich.—to manufacture and sell electrical machinery, etc. Capital stock, $10,000. Promoters; Chas. C. Kri zer, A. C. Runnels, Nancy Runnels, Newaygo.

ELECTRICAL PATENT RECORD.

Letters Patent Issued June 11, 1895

ELECTRIC RAILROADS AND APPLIANCES.

540,653. Supply System for Electric Railways. Oscar A. Enholm, New York, N. Y., assignor, by mesne assignments, to the Electro-Magnetic Traction Company, Washington, D. C. Filed Nov. 3, 1891.

540,664. Electric Railway. Sebastian Hoeninger, Milwaukee, Wis. Filed Aug. 15, 1894.

540,883. Trolley. William E. Steinbach, Philadelphia, Pa. Filed April 6, 1895.

540,900. Conduit Electric Railway. David Brooks, Jr., Philadelphia, Pa. Filed June 9, 1892. Renewed Dec. 7, 1894.

540,901. Conduit-Railway Conductor. David Brooks, Jr., Philadelphia, Pa. Filed Feb. 27, 1892. Renewed Dec. 8, 1894.

541,020. Conduit Electric Railway. Daniel W. Smith, St. Louis, Mo., assignor, by direct and mesne assignments, of two-thirds to Alfred Bevis and Charles H. Longstreth, same place. Filed Sept. 10, 1894.

541,044. Trolley Wheel and Yoke. William H. Fritz, Dayton, Ohio, assignor of two-thirds to Orlando P. McCabe and George R. Decker, same place. Filed March 12, 1895.

ELECTRIC LIGHTS AND APPLIANCES.

540,800. Electric-Arc Lamp. Samuel P. Parmly, Chicago, Ill. Filed Oct. 26, 1891.

DYNAMO ELECTRIC MACHINERY.

540,668. Regulation of Alternating Generators. Rudolph M. Hunter, Philadelphia, Pa. Filed June 21, 1894.

BATTERIES, ETC.

540,620. Electric Circuit. William W. Alexander, Kansas City, Mo., assignor to the Gill-Alexander Electric Manufacturing Company, same place. Filed March 24, 1890.

TELEPHONE AND TELEGRAPH APPARATUS.

540,761. Telephone. Walter W. Scott, Buffalo, N. Y. Filed March 4, 1895.

540,772. Photo-Telegraph. Charles Willoughby, San Francisco, Cal. Filed Nov. 3, 1894.

540,781. Telephone-Transmitter. Daniel Drawbaugh, Eberly's Mill, Pa., assignor to the Drawbaugh Telephone and Telegraph Company, New York, N. Y. Filed Feb. 16, 1895.

540,799. Cross-Bar for Telegraph-Poles. James B. Oliver, Shield's Station, Pa. Filed Aug. 10, 1894.

540,899. Telegraphic Apparatus. Louis Boudet and Pierre Lacombe, Lumel, France. Filed Oct. 20, 1894.

540,959. Telephone-Transmitter. Daniel Drawbaugh, Eberly's Mill, assignor to G. Milton Bair, Hanover, and Calvin W. Ream, Reading, Pa. Filed Feb. 23, 1895.

540,960. Carbon-Holder for Telephones. Daniel Drawbaugh, Eberly's Mill, assignor to G. Milton Bair, Hanover, and Calvin W. Ream, Reading, Pa. Filed Feb. 21, 1895.

540,961 Telephone-Electrode. Daniel Drawbaugh, Eberly's Mill, assignor to G. Milton Bair, Hanover, and Calvin W. Ream, Reading, Pa. Filed Feb. 21, 1895.

540,969. Telephone. Stephen D. Field, Stockbridge, assignor to the American Bell Telephone Company, Boston, Mass. Filed Dec. 5, 1894.

540,974. Multiplex Telegraphy. Daniel B. Grandy, St. Louis, Mo. Filed Dec. 17, 1894.

541,036. Telephone-Transmitter. Charles Clamond, Paris, France, assignor to the Clamond Telephone Company, Philadelphia, Pa. Filed March 20, 1895.

541,037. Telephone-Transmitter. Charles Clamond, Paris, France, assignor to the Clamond Telephone Company, Philadelphia, Pa. Filed March 20, 1895.

SIGNALS AND SIGNALING APPARATUS.

540,642. Automatic Electric Railway-Signal. William Daves, Jersey City, assignor of one-half to William H. Peddle, Roselle, N. J. Filed Feb. 14, 1895.

540,859. Electric Railroad Signal. Burton H. Gedge, Anderson, Ind. Filed May 20, 1892.

MISCELLANEOUS.

540,685. Electric Brake. William B. Porter, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed March 9, 1895.

540,687. Covering for Electric Wires. Franklin S. Randall, Philadelphia, Pa., assignor of one-half to Howard A. Engle, W. Howard Holden and Dillwyn P. Roberts, same place. Filed Jan. 2, 1894.

540,949. Electrical Push-Button. Edwin A. Clark, Cleveland, Ohio. Filed Jan. 24, 1895.

ELECTRICITY.

Vol. VIII.
NEW YORK, JUNE 26, 1895.
No. 24

ELECTRICITY

Published every Wednesday by the

ELECTRICITY NEWSPAPER CO.

B. E. GREENE, Pres't. L. J. MONTGOMERY, Sec'y.

PUBLICATION OFFICE:
6 Park Place - New York

EDITORS: NELSON W. PERRY.
BURTON E. GREENE.
R. H. WILLOUGHBY.

BUSINESS MANAGER, - - JOHN L. GANS.

SUBSCRIPTION RATES:

United States,	$2.50
In Clubs of Five or More,	$2.00
Foreign Countries,	$4.50
Single Copies,	10 Cents

ADVERTISING RATES:

As Electricity reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.

Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

Entered at the N. Y. Post Office as Mail Matter of the Second-Class.

TRADE SUPPLIED BY
THE AMERICAN NEWS COMPANY,
THE WESTERN NEWS COMPANY,
And their Agencies in all Principal Cities.

There are still left in this trade a large number of men who have entered into it for their life work. They may be disheartened, but they have not given up. It is for them that we write. To them we present our argument, and to them we must all look for the re-establishment of business principles, the reinforcement of the doctrines of common sense.

It is for these men to consider just why wrong has temporarily triumphed over right, why it was possible for the tricksters and adventurers to bring the industry to its present condition.

And when these questions receive careful thought the only answer possible is that the electrical press has not done its duty.

If the "Electrical Engineer," the "Electrical World," the "Electrical Review" and the "Western Electrician" had faithfully done their duty by the trade they claim to represent, whose best interests they claim to guard, the present situation would never have confronted us.—"ELECTRICITY," June 5, 1895.

EDITORIAL NOTES.

Cowardice, Not Ignorance.

At intervals during the past three years Electricity has been at some pains to show in just what particulars the electrical press of this country has failed to be what it should have been in its relations to the trade and to the public. The inevitable results of years of servility and sycophancy on the part of these papers are now so plainly evident that we have recently felt called upon to again call attention to this phase of the situation at considerable length. The case against them has been clearly presented and the charges have been specific.

The *Electrical Review* is so far the only one of our contemporaries which has seen fit to make any attempt to defend itself or to cast discredit upon the statements made by us. The weakness of the *Review's* attempted reply and the silence of the others are simply a confession of judgment. They plead guilty to the charge of conducting their papers solely with the view of extracting as large an amount of money as possible out of the legitimate concerns without giving them any equivalent whatever in the way of protection against the usurpers who have all but succeeded in ruining the entire business.

There are to-day thousands of men in this trade who looked with a measure of skepticism upon Electricity's campaign in the beginning, but who, with the progress of events, the verifications of our charges, have come to be full believers in the justice of our attack upon dishonest methods and upon the men chiefly responsible for those methods. These men see, just as we see, that if the electrical press had done its duty the trade could never have been forced into its present condition. These men are waiting for a reply from the *Electrical World* or the *Electrical Engineer* to our strictures. In the absence of such reply they will not fail to give adequate expression to their contempt for the cowardly policy which has controlled these papers.

We shall take this question up next week in a slightly different manner, and shall then begin the publication of a series of articles, with a vast amount of official data, giving specific instances of the general financiering methods which have been the cause of fleecing thousands of innocent investors, and which have brought the entire range of electrical securities into disrepute. The general plan of these articles may be understood in advance by a reference to the exposé of the Tacoma swindle two weeks ago.

Meantime we would like to have an answer from any or all of our contemporaries to the following question:

If the electrical trade has been conducted upon correct lines, if a radical reform is not demanded, why is it that concerns engaged in it in the early days, with opportunities for making money never before offered in any line of business save perhaps mining and drilling for oil, are all either in the graveyard or in the hospital for incurables?

The case resolves itself into one of two alternatives. Either the lines upon which the business has been conducted were fundamentally wrong, or else the entire industry is a short-lived bubble, the apparatus and devices sold have not been commercially practical, the entire business of electric lighting and power transmission is unstable and short lived and must give way to its competitors. Is the latter true? Perish the thought.

The trade has not been right. It has been conducted upon an entirely wrong basis. The responsibility for allowing the wrong to assume temporary control rested even in 1880 upon the electrical press—the responsibility for the past fifteen years of dishonor and disgrace.

Of course we are aware that the plan of editorial work followed by our contemporaries is different from that in practice in this office. We believe in the notion of getting out among the people, meeting every week just as many of the leaders in the business as is possible and hearing their views, which are then properly dissected and presented for the edification of the multitude, whereas the papers above mentioned evidently believe that editorial work should be done within the four walls of an office, and that the editor should depend upon his own inner consciousness, or Divine grace, to know what is going on and to treat the burning questions of the day with becoming wisdom.

Nevertheless, the excuses of our contemporaries that they are ignorant of the wrongs which have been perpetrated upon the industry, and consequently could not speak, are utterly invalid.

THEY DID KNOW. THEY COULD NOT HAVE BEEN IGNORANT.

The excuses which they advance for not doing their duty by those who have made them what they are have sprung from cowardice and deceit, and are offered in the belief that the standard of intelligence in the trade is so low that they will not be called to book for their cowardice.

Not one of our contemporaries but was familiar with the general trend of affairs since 1879; not one of them but was aware that the situation brought about by the G. E. Company's formation was but the climax of a policy of injustice to competitors and of robbery of investors which had characterized the large companies from their inception; not one of them but knew absolutely that the success of the G. E. Company meant the wiping out of every other concern in the trade, the driving into other fields of hundreds of individuals who had just as good (or better) right to make money out of the electrical business as any man in the combined companies.

Yet, did they speak one word of condemnation of the campaign of extinction and extortion? The record says no.

We propose to *prove* to those who have any lingering doubts upon the subject that ELECTRICITY has been RIGHT, and that the papers mentioned above are WRONG; that they have utterly failed to execute the trust reposed in them; that through cowardice, flunkeyism and mistaken motives of self-interest they have supplied aid to the enemy, and assisted in producing a condition of affairs in this trade never seen in the history of any other legitimate industry, a condition which could not have existed if they had done their duty by the concerns which have supported them since their birth. For even on the narrow view that a trade paper must protect the majority of its advertising customers these papers are clearly open to condemnation. The G. E. interests never gave them over 5 per cent. of their total support. The independent element made them, fostered them, kept them, and has for three years been spat upon by each and every one of them.

ELECTRICITY has been right; our contemporaries have been wrong. We hurl defiance at our critics. We have already seen many of them pass into bankruptcy because of their inability to believe the truth. We shall survive them all. We will be here enjoying the fruits of our honest labors after the trade has been purged of its dishonor, after some of our contemporaries have gone to that graveyard which awaits every paper that persistently fails to do its duty. We shall be here after all those concerns who fail to see their duty in the premises have joined their predecessors.

Can any man with a grain of common sense find any excuse for this breach of trust on the part of the papers mentioned? Would it have been conceivable in any other group of trade papers in the world?

They had been with the industry almost from its birth. They were not ignorant. They had seen the Edison and United States companies organized and conducted upon an utterly false basis. They had seen the efforts to bamboozle the public into supposing that ridiculous patents controlled the business—into the belief that the art itself was born after 1878.

They had seen the old companies selling worthless rights to local users all over the country, extracting large sums of money for something which could never be delivered, planning for the certain commercial failure of a large majority of the stations established, thus undermining the only foundation upon which a solid industry could rest. They had seen these large sums of money so extorted under false pretences wasted in gross mismanagement, the stockholders of the parent companies assessed again and again, thus ruining the public confidence at both ends of the line. They had seen these companies, after less than ten years of existence, and with the grandest opportunities for solid business success ever known in the history of the world, either confess bankruptcy or resort to further manipulation and combinations to prolong the dishonest practice.

They could not have been ignorant of the career of the Thomson-Houston enterprise. The records were plain. They could not have failed to hear, not once but a hundred times, the story of robbery and injustice practised upon central station men from the beginning. They knew the towns in which exclusive T.-H. rights had been sold, where, in violation of all rules of commercial honor, the same men had sold successively Schuyler, Brush, Excelsior and Ft. Wayne apparatus to other stations, selling the bonds as they established the plants to confiding Boston purchasers. They could not have been ignorant that this T.-H. Company came into the business with no higher idea than those of the highwayman, that their salesmen were instructed to place apparatus with utter disregard of the rights of their own customers, and with equal disregard of the question whether or not the plants would pay. If they found a city or a town with a station already established, making insignificant profits or even losing money, they had no compunctions over starting another one in the same town, unloading the securities upon the public, eventually forming a combination of the two plants, issuing fresh securities, and afterwards starting a third plant, carrying the plan out to exhaustion.

We say the electrical papers could not have been ignorant of these conditions. They knew the record of the men controlling the affairs of these large companies. They knew that nothing could come from them or their policy save dishonor and injury to the industry. They knew that the possibility for good in these men or their methods did not exist. They had been tried and found utterly wanting in everything needed to establish a lasting and creditable industry.

These papers were not ignorant; they were cowardly and culpable.

There is no occasion for ELECTRICITY to boast over the results of our efforts to improve the situation of this trade and to prevent the disasters which have overtaken it.

We are justified, however, in pointing out that so far we have been correct in our position, correct in predicting months ahead just what it was coming to. And upon the strength of our record, which is clean, we claim the right to be heard, and urge the careful consideration of our views.

The only journalistic work done in behalf of the independent, honest element has been done by ELECTRICITY. If half as much had been done by each of the other papers the career of the present management of the G. E. Company would have been brought to a close before January 1, 1893, before the trade was bedeviled, profits wiped out, confidence of investors killed, and commercial credits ruined.

Just what is the specific duty of a daily paper is perhaps a fit subject for argument. Among successful and respected newspaper men there are various theories and various policies pursued.

But when we come to the consideration of the duties of a trade paper, especially in a trade such as the electrical trade was in 1880, only one view is permissible as to the duty which confronted every journal embarking in the field. That duty was to keep the adventurers and schemers out, to explode all false notions as to the possibilities of the art, to make clear its limitations, to foster all that was good and condemn all that was bad, to throw cold water upon every scheme in which investors were likely to lose their money, to see to it that the confidence of the public in electrical matters was retained, to prevent at whatever cost the success of every attempt of one company or combination of companies to control the business, to prevent the deals of the speculators, and perhaps first of all to discourage the notion of forcing the demand for the product—putting out unfit apparatus.

Measured by any standard of duty to their trade or to the public, these papers have no right whatever to claim the good-will or support of any honest concern in the manufacturing business.

If the men proposing to put their money into central station enterprises, and who finally did invest, paying large amounts of money for worthless rights, had been informed by the press as to the prospects for success upon the plan then in vogue, would they have lost their money, as thousands have?

In not one single case have the electrical papers ever shown any appreciation of the dangerous methods which have been in practice from the beginning, and which have been carried now almost to the point where legitimate, conservative companies cannot conduct their business.

And it is not only as passive agents that they have assisted the wreckers. They have given active aid up to the full limit of their courage or abilities. They have had no compunctions about illustrating and puffing any and every device or piece of apparatus produced by any company which would advertise. They have wilfully misrepresented the merits and faults of the very things upon which they were supposed to pass as experts, usually printing any statements made by the advertiser as semi-editorial comment when asked to do so. They have descended to the lowest depths in servile puffery, when their duty to the public demanded that they should in a general and dignified way make plain whether or not certain lines of apparatus had the possibilities of commercial success or not. The *Electrical Engineer* has gone so far as to puff an electric hairbrush editorially, and is now throwing open its columns to a contribution to prove that a worthless primary battery is in reality a new and valuable advance in the art.

The record is clear. If the trade is ever to be upon a solid footing, if American electrical journals are ever to be received abroad with the same degree of respect which we accord to our British and Continental contemporaries, it will be because the honest workers in the trade on this side assert themselves and compel the press to change its policy, to stand up firmly for the right, even at some apparent financial loss.

The *Electrical World*, the *Electrical Engineer*, the *Western Electrician* and the *Electrical Review* have all been conducted from the start upon the notion that the *chief aim* of a trade paper is to print advertisements and get pay for them. It should be nothing of the kind. The controlling motive should be to benefit the trade on the lines laid down in the first part of this article. The pursuit of advertising patronage should be only an incident in the general plan.

* * *

IN the absence of any easier padding, the *Electrical Review* printed last week the full text of the Berliner decision. Inasmuch as that paper was not competent to analyze the decision and present a summary of what it meant, we suppose this was the best thing it could do. It was at least more interesting than the reading notice cuts upon which our contemporary usualy relies to fill up its space.

The Elevator Trust. The exposé in our issue of June 12 of the Elevator Trust and its despicable business methods came to many like a thunderbolt out of a clear sky, so unprepared were the general public to believe that what appeared on the surface as the keenest competition among reputable business firms was a combination working under the cover of a false name to drive out of the business by disreputable means other manufacturers in the same line whom they could not bulldoze or cheat out of honestly obtained contracts.

Among those most astounded were the architects, who for years have supposed that the contracts which they had been awarding for what appeared to be competitive bids were in fact awarded to one or the other member of a Trust which apportioned the contracts out according to the territory in which the job was to be erected. Among the better class of architects there is nothing so distinctly abhorred as combinations of this kind, and our publication of the facts was a revelation to these which will not be forgotten.

To the general public, who are less interested in these things, the Trust feature, while equally a surprise, attracted less attention than the methods employed by the Trust. If it were not susceptible of the amplest proof, it would be incredible that firms so well known as the Otis Bros. & Co., the Crane Company, the Whittier, and Stokes & Parish would be guilty of such unbusinesslike methods. There is ample proof, however, and in this issue we give another chapter scarcely less startling than that given two weeks ago.

But it is the method of all trusts and combinations which seek to control a whole industry. The same bulldozing and threatening methods have been employed by all, and it is these disreputable methods that have been the curse of the electrical industry from the start.

When a judge of a prominent court finds it necessary to characterize the testimony of one of the Trust's most valued agents as George K. Reynolds's testimony has been characterized, it is high time that honorable business men should hold themselves aloof from those profiting by or seeking to profit by the work of such agents.

It is scarcely to be believed that one of these companies is any worse than the others, but in the evidence already adduced the Otis Company and Mr. Norton P. Otis seem to be placed in the most unfavorable light. Honorable business men do not conduct their business in the way the Otis Company are shown to be conducting theirs, and honorable business men will not do business with those who are known to stoop to such methods as they employ. We believe therefore that it is only necessary to make the methods of the Trust known to destroy the power of that unholy alliance. We believe that honorable business men when they become familiar with the methods employed by these firms will hold themselves aloof from them in all their future transactions. They will spurn them as they would the leper. They will not lose by this, however. The independent manufacturers of elevators are succeeding, notwithstanding this powerful combination, by sheer merit. They have been wonderfully handicapped in the race but are succeeding nevertheless. We propose to help them in this fight, and believe that we have helped them, for it is only necessary that the methods of the Trust should be known that they should be despised.

To those who prefer the triumph of straight business methods over the spurious kind practised by the discredited Elevator Trust, it is encouraging to know that notwithstanding the vicious attacks made upon competitors all along the line, these competitors flourish and grow stronger every month. Among those companies not before referred to in this article we may mention the following:

The Keystone Electric Company, Erie, Pa., manufacturers of special motors for electric elevators, have made and sold a large number of these motors. They have recently contracted to furnish the Smith-Hill Elevator Company, Quincy Ill., 100 for this season's trade. They do not intend to infringe anyone's valid patents, neither do they intend to be driven out of a field which they have a right to live in.

The Smith-Hill Elevator Company have been devoting their entire attention to the construction of electric elevators, and have for more than two years been doing a successful and profitable business.

The Graves Elevator Company, Rochester, N. Y., is another of the companies which the Trust has been unable to control or ruin. The combination exerted extraordinary efforts to entrap the Graves Company but did not succeed. This Graves Company is still on the outside and doing more business than ever, and doing it in an honest, straightforward way.

Morse, Williams & Co., Philadelphia, and the Moore & Wyman Elevator and Machine Works, South Boston, Mass., are two other anti-Trust elevator manufacturers. Morse, Williams & Co. have branch offices in New York and other large cities and are thoroughly prosperous. The Moore & Wyman Company have sold many of the elevators now in use throughout New England. Several good contracts have been closed which the Trust companies tried hard to get.

Honest, straightforward methods must always win ultimately, and we are pleased to know that in the electric elevator business they have already won.

* * *

Henry W. Frye. In the death of Henry W. Frye electrical journalism has suffered an irreparable loss and those of us who knew him personally and had been most intimately associated with him in his work, as was the case with the writer, will feel his loss most keenly and personally.

Mr. Frye was in all respects a rare man. Well equipped for his chosen profession, he pursued it conscientiously and patiently, and although his retiring disposition and innate modesty prevented his being as widely known as his merits entitled him to be, his work spoke for him in no uncertain terms. Among the somewhat limited circle of those who knew him intimately he was most dearly loved and admired. Among those he will be mourned as a brother.

Never of rugged strength, still there was a force about him which, if properly husbanded, might have carried him to a ripe and honored age. He was, however, a martyr to duty and, forgetful of self, immolated himself upon that altar upon which it is an honor to die, but upon which it would have been a greater honor to have lived. We believe it may be truly said that electrical journalism is better for Mr. Frye's having lived. We know that it has sustained a severe loss in the death of this thoroughly lovable man.

"ELECTRICITY" LEADS.

ELECTRICITY is giving to its readers every week the benefit of more original thought than any other journal in the field. It is away ahead of all competitors not only as a newspaper but as an authority on scientific questions. Last week we presented no less than ten pages of original matter upon topics of vital interest to everyone in the trade. No other paper approached this amount. One of our contemporaries had only one column, and another three columns. We give better value to subscribers than any one of those claiming antedeluvian birth. We lead now, and shall continue to do so.

Under the Searchlight.

Views and Opinions on Timely Topics.

IF the electrical trade has been conducted upon correct lines, if a radical reform is not demanded, will our critics kindly tell us why the concerns engaged in it in the early days, with opportunities for making money never before offered in any line of business save perhaps mining and drilling for oil, are all either in the graveyard or in the hospital? The case resolves itself into one of two alternatives. Either the lines upon which the business has been conducted were fundamentally wrong, or else the entire industry is a short-lived bubble, the apparatus and devices sold have not been commercially practical, the whole business of electric lighting and power transmission is unstable and short lived and must give way to its competitors. Is the latter true? Perish the thought. The art has been a greater blessing to the human race than any other since the dawn of the Christian era save the art of printing. That it was possible to make and sell stable and commercially practical apparatus is proved by the large number of lighting plants put in as early as 1880-82 and still running successfuly.

The proposition upon which we base our campaign cannot be dodged. The industry is all right. Some of the men who have been in control are all wrong, however.

* * *

ASTONISHING MISSTATEMENTS.

According to the *Electrical Engineer* (London), Mr. Sydney F. Walker, in a recent article on the transmission of power, said:

> The increase of the efficiency of electrical power transmission and the growing familiarity with higher and higher voltages are bringing the natural sources of power more and more within the limits of practical usefulness. Already the dream of generations of engineers, the utilization of the energy of the falls of Niagara, is an accomplished fact, in part at least, the city of Buffalo, some seventeen miles away, being lighted by electricity generated by the energy of the falling water, and some of its factories having their machinery driven by the same source. It is but the development of this, certainly a large development but one that may possibly take place within the lives of some of the present generation, for us to be utilizing the energy of Niagara in the same way in this country.

The *Engineer* prints this without a word of comment, in its regular news columns, and becomes really responsible for the spreading of gross misstatements of fact. Mr. Walker's comments on other subjects have been frequently reprinted in these columns, and he has been supposed by American editors to be a man of considerable ability. We fear, however, that we will always have to ask him, when he makes a statement hereafter, how he knows.

If the *Engineer* indulged in these lapses very often it would soon sink to the level of its American namesake, which is a pretty low one where *facts* are concerned.

It ought not to be necessary to tell our English friends that there is yet no line built between Niagara Falls and Buffalo, and that it is as likely as not never to be built.

The Niagara enterprise is a great one and we are proud of it, but it does not yet *prove anything* as regards transmission.

It may or may not be a success, but so far no wheels have been turned by Niagara current.

* * *

Henry Bier's Misfortunes.

At New Orleans Judge Moise has allowed Henry Bier, the millionaire broker who was convicted last month of perjury in the City Railroad franchise case, to be removed from the parish prison to his home on Esplanade avenue, on the ground that he was very sick and would die if confined longer in the prison. Bier was a man of great pride, and seems to have felt keenly the humiliation of his conviction. His physician reports that death may come at any moment.

* * *

It is Absolutely Determined.

(From the St. Paul Globe.)

That ELECTRICITY is to be the great working power of the future is already sufficiently determined.

* * *

A RECENT $10 bill received at this office bore the pathetic legend, written in ink, doubtless at parting, "Never bet on a horse race. M. L." We do not know the writer, but his advice is sound. Across the chasm, shake in spirit, M. L., and never bet at all.

* * *

Smart Writing.

(From London Electricity.)

Our fighting contemporary, ELECTRICITY, devotes nearly six columns of editorial matter to a further condemnation of the General Electric Company (U. S. A.). This tirade begins, "The right will win," and closes, "This is the key-note of the entire conflict—THE RIGHT AGAINST THE WRONG." For a summing up of the position and the features which have led up to it, this commentary is of value; it is worth reading if only as a good example of smart writing on a financial subject in a technical paper. . . . A third editorial deals with the "Load Line," only this load line is that of the sales of the G. E. Company, and not of supply from a central station. What it is like is shown on a page a little further on—it is a big drop. ELECTRICITY foretells the future in the words, "Descensus averni facile est," and brings the curve down to zero. The page looks very gruesome, for under the title we find a presentment of a Coffin—it must be remembered that Mr. C. A. Coffin is a leading spirit in the G. E. enterprise.

* * *

THE following appeared without comment in the *Electrical Review* last week:

THE VALUE OF BEING QUOTED.

To be constantly quoted is certainly a sure sign of successful news paper work. It means that the best judge of a newspaper, the exchange editor, is passing his favorable opinion.—*The Fourth Estate.*

This is sound logic, and ELECTRICITY's scrap book proves that it has been quoted more in three years than all other American electrical papers combined.

* * *

Must Have Been Battery Motor Outfits.

(From New York Sun.)

A fire started in the steamship Massachusetts, of the Atlantic Transport line, at the foot of West Twenty-ninth street, about noon yesterday. The outbreak was in the meat storage room in the rear hold, and was caused by the friction of two large electric fans which are used to keep the meat cool.

* * *

Making Light of a Grave Subject.

Many of our daily contemporaries are cracking jokes at the idea of trolley funeral trains now in use at Harrisburg, San Francisco and other places. This is clearly wrong. If electricity can kill 'em why should it not at least help to bury 'em.

* * *

The Paper That Tells the Truth Has Every Advantage.

(Col. H. G. Prout in New York Independent.)

ELECTRICITY has many advantages.

* * *

It is Also the Power of the Present and of Eternity.

(From Interview with F. K. Hain in Pittsburg Times.)

ELECTRICITY is the power of the future.

Believes in the Paper.

To the Editor of ELECTRICITY.

I am a great believer in your paper, and think that it goes into the hands of people who are apt to purchase electrical goods.

X.

Boston, Mass.

Another Massachusetts patron of ELECTRICITY writes:

Allow me to congratulate you on your last editorial, wherein you stated that the various journals in years gone by had not done their duty in bringing out the various humbugs connected with the electrical business.

Independent Telephone Companies Prefer to Fight.

UNITED ACTION AGAINST THE BELL COMPANY ASSURED.

Harmonious Meeting of the National Association at Pittsburg.

(Special Dispatch to ELECTRICITY.)

PITTSBURG, Pa., June 25, 1895.

The morning and afternoon sessions of the Independent Telephone Companies at the Hotel Duquesne were devoted yesterday to an informal discussion of the situation. Expressions of opinion were invited from representatives present as to their views upon the scope and objects for which the organization should be constituted. These expressions differed somewhat in detail, but in the main it was agreed that it would be best to specifically define the purposes of the organization, the chief of which shall be to offer complete and full protection to all users of telephones manufactured by the members of the Association.

Those attending were: James E. Keelyn and Stanley S. Stout, Western Telephone Construction Co., Chicago; R. S. Johnson, Viaduct Manufacturing Co., Baltimore; P. C. Burns, American Electric Telephone Co., Kokomo, Ind.; H. T. Johnson, Manhattan Electrical Supply Co., New York; A. F. Stanley, Deveau & Co., New York; Frederick Harrington, Union Electric Co., Cleveland; A. H. Chadbourne, U. S. Telephone Construction Co., Philadelphia; E. S. Wallace, Columbia Telephone Co., New York; J. G. Ihmsen and B. Hubbell, Keystone Telephone Co., Pittsburg; L. Levy, Anthony Co., Cincinnati; Chas. W. Price, *Electrical Review*; B. E. Greene and J. L. Gans, ELECTRICITY, New York.

Letters were received from many other companies assuring their support of whatever action the Association may take.

The delegates were guests of Solar Carbon Manufacturing Co., of Pittsburg, as a coaching party to the Country Club, East End. The Keystone Telephone Co. entertained the delegates at lunch. Discussion was continued in an informal manner.

Permanent officers will be chosen to-day.

There was a unanimous expression of opinion in the lobby that the Berliner patent as it stands now can surely be defeated by a well-conducted defence of the first infringement case.

A Georgia Water Power Plant.

A new cotton mill recently erected at Athens, Ga., is to be operated by electric power to be delivered at the mill at $22.50 per horse power per annum of 365 days, twenty-four hours per day. The Athens Electric Railway Company will furnish the power. This company is developing 700 horse power at a water power three miles distant.

The Boston *Advertiser* states that Chief Engineer Carson of the Boston Transit Commission, who has just returned from Europe, has brought home photographs of an experimental electric railway with suspended cars which has been operated successfully at Deutz, Germany, opposite Cologne. Fifty persons can be carried at once, and the suspended car is operated by an electric motor, derailment being prevented by friction plates. The wheels are secured to the motor, and the car is fastened to the motor by means of a center pin. Springs make the car easy riding, each truck having four wheels, and each car is supplied with two motors. Brakes are also provided, which grasp the rail both at the top and bottom. The supply of electricity is so regulated that if one car gets stalled the car following it is not supplied with any more motive power until its predecessor is started on its journey again, thus reducing the possibility of collision. The brakes work automatically.

The Attempted Elevator Monopoly.

In our issue for June 12th considerable space was devoted to the Elevator Trust and its devious methods of attempting to maintain a monopoly of a business which cannot legally or otherwise be bottled up.

Since the appearance of that article, more information has come to hand which makes the crime, for such it is, of this Trust the blacker.

First, in regard to the nature of the organization of which we have said so much. It seems that the four or five companies which are involved came to an agreement by which all of their patents were pooled and taken over by the National Company—the Trust—an organization composed of the members of these several companies. The charter of the National Company does not permit it to manufacture, sell or install elevators of any kind, but simply to license and sue on the patents which it holds in trust. As soon as the National Company was organized the territory of the United States was apportioned out among the Otis Company of New York, the Crane Company of Chicago, the Whittier Company of Boston, and the Stokes & Parrish Company of Philadelphia, each of these companies being licensed to use the patents of all the others in the territory which had been set apart as its own especial preserve. The bids, as before stated, for any given contract were made out for all of the companies by the same party, and hence there was no competition among their own members. It was further agreed, however, that should any company in the Trust invade the territory assigned to another, and effect a sale therein, that company should pay over to the National Company a certain sum of money which should go into the general treasury and constitute a fund to defray the expenses of litigation. The result of this arrangement has been to make an alleged infringement of any one of the individual companies' patents a common cause for all. The cost of the litigation was equally borne by all; the experts of each of the separate companies became the experts for the National Company, and the apparent anomaly was presented of alleged business rivals stoutly maintaining the defence of interests that to the public eye were from a business standpoint irreconcilable. The moral effect of this has been great, almost incalculable, and there is little wonder that the smaller concerns—not in the Trust—feared to measure strength in the courts with this iniquitous Trust.

If the alleged infringement were on a patent originally controlled by the Otis Company, for instance, the title of the action would be National Company and Otis Brothers & Company vs. ——. If it happened to be the patent of the Crane Company; the title would be National Company and Crane Company vs. ——, and so on through the list, but all of the members of the Trust assisted in the litigation to the utmost extent of their ability and all of them benefited by it equally.

The pooling of interests for mutual protection is in itself not a crime, but may be made a crime if legitimate methods of protection are exceeded, and this is just what this Trust has repeatedly done. It is perfectly evident that should an outsider attempt by bidding against them to get a contract, the combined statements of the agents of the Trust antagonistic to the quality of the new candidate's wares would be likely to prejudice the purchaser against those wares. This has been repeatedly resorted to. Still another method to which we have already referred is the threatening of customers of outside manufacturers with suits for infringement should they become purchasers, or being purchasers if they did not discard the apparatus and replace it by elevators made by members of the Trust. Actual suits have been avoided in some cases, but in others the suits have been piled on as numerously as possible, in the hope of bankrupting the offending company and thus acquiring its title and business. Noteworthy instances of this kind are found in the case of the Standard Elevator Company of Chicago and of Morse & Williams of Philadelphia. Since both of these cases were essentially the same, and the chief testimony was also the same, the two may be considered here as one. The testimony of William H. Wells, Jr., is of exceeding interest in this connection. Mr. Wells had been connected with the Standard Elevating Company of Chicago.

Cross-examined by Mr. Chapin.

Cross Q.—You are not very friendly with the complainants (National Company and Otis Brothers & Company), are you?

A. by Mr. Wells.—I feel very friendly towards them, because they have sued me on very similar alleged infringements of patents several times within the past few years, and in each case we have won the suits so far as they have come to a final hearing, and have won them on precisely the same kind of evidence and defence as I have given in this case, so that I feel very friendly towards them, but I doubt very much their deep good feeling to me.

Cross Q. 48.—You are a defendant in a suit now at issue in which the complainants in this suit, the National Company and the Crane Elevator Company, are complainants, are you not?

A.—I have been a defendant in *four* or more suits brought by the National Company and the Crane Elevator Company, and three at least of these suits have either been won on the final hearing by me or have been dismissed by the complainants, who paid all costs. I think that there is one case still pending on which an application for a preliminary injunction was made, which injunction was refused by the Appellate Court. I do not think the final decision has yet been rendered in that case.

Cross Q. 49.—You have, I suppose, the same friendly feeling toward the Crane Company as toward these complainants, resulting from the fact that they have sued you on a number of occasions, have you not?

A.—I have about the same feeling for the National Company, the Crane Company and the Otis Company and all of the members of the companies, because they are all part of one big elevator trust, and the same men are practically the controlling and largest stockholders in each. My friendly feeling for them is not based so much on their having started the various suits which they have against the smaller elevator builders of the country—myself among the number—as it is in the fact that they are losing their suits about as fast as they come to a hearing, and in this way are destroying a mistaken impression which existed throughout the country that they are possessed of a valuable set of patents, the result of this being that smaller concerns will soon have an opportunity to do their legitimate business instead of being obliged to occupy their time and expend their money in defending trumped-up suits brought by a wealthy corporation or elevator trust known as the National Company.

These are very strong words from Mr. Wells, but they are none too strong and went uncontradicted. The policy pursued by the Trust against the Standard Company was to multiply suits for infringement, requiring the defendant in each case to give bond pending a hearing and thus to tie up their capital and cripple their business. The evident intention was when this was accomplished to buy them out and thus end competition from that quarter. The Trust had gotten the Standard Company's business in just about the condition desired when to their surprise others with ample capital captured the prize about which they had so long been weaving their web. The company has been reorganized, and under a new name and ample capital bids fair to break the strength of the monopoly in the Windy City.

In our issue for June 12th we published, somewhat *in extenso*, the remarkable fake statements against the Sprague Elevator by Mr. George K. Reynolds, the engineer of the Crane Company. To show the contemptible and dishonest methods resorted to by the Trust to down the opposition, it may be well to show Mr. Reynolds up in his true light. It seems that he is employed to do, and is willing to do, a great deal of the dirtiest work that the Trust has to do to accomplish its ends. Reynolds poses as the engineer of the Crane Company, but as indicated before, he is available in all suits brought by the National Company. In regard to his character, it is so notoriously bad that Judge Alvey of the Court of Appeals of the District of Columbia, in the suit of Wells et al. v. Reynolds et al., decided in last September, uses the following severe language in referring to his testimony:

"The right here so plainly recognized in the Standard Company to use the device in its elevators certainly did not exist if the claim of Reynolds now asserted be true. He was either recognizing what he knew at the time to be the right of the matter or he was attempting to deceive and mislead both his employers and the public.

"The strong inference from the conduct to which we have referred is that Reynolds *knew* that he had no rightful claim as original inventor of the device, and hence he made no claim until moved thereto by subsequent events."

The circumstances which called forth these remarks from the Court were the following:

Wells and Reynolds were both connected with the Standard Company, and Wells obtained a patent on elevators which the Standard Company acquired. Reynolds while an agent of this company always admitted that Wells's patent was good—in fact, the question does not appear to have arisen in Reynolds's mind during this period as to Wells being fully entitled to the patent as the first inventor. Subsequently, however, Reynolds left the Standard Company and took employment with the Crane Company. He then applied for a patent on essentially the same idea as that involved in Wells's patent—swore that he was the first inventor and claimed an interference. This was so palpably a fraud as to call forth the above quoted remarks from the Court. It was an endeavor on Reynolds's part to cheat the Standard Company out of its rights for the benefit of the Crane Company and the Trust, who had acquired an interest in Reynolds's alleged invention. This is but one instance of the dirty work which Reynolds has been called upon to do for the Trust. The statement quoted in a former issue in regard to the Sprague elevators was another.

Returning now to the methods employed by the Otis Company to drive the A. B. See Company out of business, it was stated in our issue of June 12 that for years the Otis Company had been threatening intending or actual purchasers of the See apparatus with suits for infringement. In this way they doubtless frightened many from purchasing who otherwise would have become purchasers. Finally they did bring suit - not against the See Company as they would have done had they taken the action in *bona fides*, but against a contractor who had erected an elevator purchased of the See Company, in the Oakdale apartment house, No 38 West 35th street. The allegation made in this suit was that the said electric elevator infringed a patent granted to S. S. Wheeler now owned by the Otis Company. This suit was brought two years ago and did not then specify wherein the A. B. See Company infringed, nor have they been able to find out since then.

Recently depositions have been taken in the case, and among those who appeared to give testimony in behalf of the Otis Company was Prof. Charles R. Cross, professor of Physics in the Massachusetts Institute of Technology. Prof. Cross's testimony is a good example of the class of expert testimony which we so strongly condemned in a recent editorial. Prof. Cross is undoubtedly one of the worst offenders in this line before the public, and so notorious has he become in this class of work that among the better class of electrical experts no confidence whatever is placed in anything he says when on the witness stand.

The cross-examination of this witness by Mr. Gifford lasted for eight hours, filled 107 pages of the record and had solely for its object to find out wherein the See elevator infringed the Wheeler patent. Prof. Cross's object was apparently to mystify the Court by bringing in technicalities which were entirely unnecessary and by directly evading the issue. The result of the examination was a total failure, in that it does not show wherein infringement exists, but probably a success as calculated to befog and involve that which nominally it was intended to elucidate.

The patent in suit contains six claims, the first of which is as follows:

"The combination of a normally constant source of electric energy, its circuit, an elevator or support for raising and lowering matter, an electric motor in said circuit for hoisting said elevator which motor may be caused to act at the will of the operator to raise the elevator, connecting mechanism between the motor and elevator *whereby the armature of the motor is mechanically driven when the elevator descends, thereby working the motor as a dynamic generator of electricity*, and the means or manner, substantially such as described, for utilizing the current thus generated."

Every one of the six claims contains the clause italicized above, and it is therefore an essential element in the combination claimed.

We have examined the elevator at the Oakdale which is claimed to infringe this patent. We find that it is a shunt motor driving a winding drum by means of a worm gear. There is a constant source of electricity, a circuit, an elevator or support for raising and lowering matter, and the motor for hoisting said elevator may be caused to act at the will of the operator. It happens that the motor employed is a shunt motor, which is self-regulating. But shunt motors were used and known to be self-regulating long before the date of this patent, viz., Aug. 18, 1885. It so happens that if the armature of a shunt motor be driven fast enough by a properly geared descending load it will give back energy to the circuit. This was well known long before the date of Wheeler's patent. There is therefore absolutely nothing new or patentable in the specifications upon which this suit is brought. Wheeler shows a number of methods of gearing by which it is possible to recover a portion of the energy of the descending car. The methods shown are either spur gearing or by belt. In the case under discussion neither of these methods is employed. The gear is a worm gear as stated before. The worm in this case is a single thread screw 6 inches in diameter and 1⅜" pitch. While it would be possible for the descending car to drive the armature by the methods shown in the patent it would be impossible for it to do it in this case, and as a matter of fact it does not. It was never contemplated that it should, and it couldn't if it had been, and even if the Wheeler patent were a valid one, which we think it would be difficult to maintain, there is still no infringement, because one of the essential features of the combination claimed is conspicuously absent.

This is one of the absurdest claims that we have ever seen or heard soberly made, and the Otis Company and their attorneys have made themselves the laughing-stock of every one familiar with the case by making it. The truth is, neither of them ever intended it to come to trial. It is too absurd to be made public. They never yet have been able to tell the defendant what he infringed, and Prof. Cross in his eight hours of examination was unable to do so. They intended to use this suit, and have used it as a club by which to frighten off customers from an honest rival. Now that they have been challenged to show their hand, it is shown to have been but a dishonorable bluff. Their only hope is to mystify the Court by bringing in issues not pertinent to the case, and to assist them in this they have paid Prof. Charles R. Cross to do some of the dirty work. Such a case as this can have no standing in court, and we believe and hope that if it ever comes to trial it will be dismissed at once with a reprimand from the Court such as will prevent a continuation of a practice which is a disgrace to a civilized community.

EXPERIMENTS ON THE RELATION OF HYSTERESIS TO TEMPERATURE.*

BY FRANK A. LAWS AND HENRY E. WARREN.

This paper gives an account of some experiments to determine the effect of temperatures much above the normal on the dissipation of energy by hysteresis in a specimen of steel.

At the time of the beginning of this research, in February, 1894, there were no complete studies of this subject known to us. A casual reference is to be found in the Proceedings of the American Institute of Electrical Engineers, Vol. VII, p. 325, 1890, by Prof. Harris J. Ryan. The tests there referred to were made on a cast-iron ring. The maximum temperature employed was 360°. The details of the measurements are not given. A short paper by Dr. Wilhelm Kuntz appeared in the *Electrotechnische Zeitschrift*, Vol. XIII, May 6, 1892. In this Dr. Kuntz showed that the hysteresis loss decreased with rise of temperature. A second paper by the same author appeared in the *Electrotechnische Zeitschrift*, Vol. XV, April 5, 1894. The magnetometer method was used by Dr. Kuntz in this work. In this paper tests of several ferrous materials are given, as well as some on a specimen of nickel.

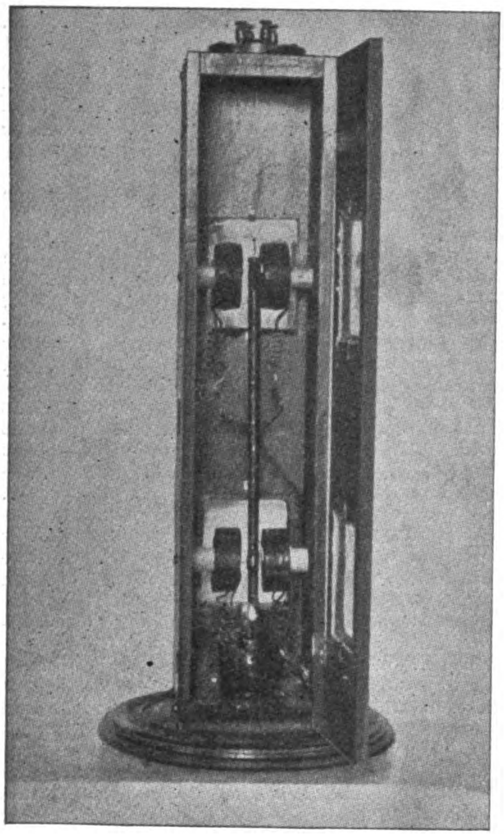

FIG. 1.

At the outset of this research it was decided that alternating currents should be used, and that the losses should be determined by a wattmeter, thus reducing the time required for observations to a minimum. The instrument which we designed and used is shown in Fig. 1. We have decided to call the arrangement a watt-balance. Mr. A. E. Kennelly has given in the *Electrical Engineer*, December 21, 1892, a description of a "Differential Wattmeter." This instrument gives the difference of the mean values of two definite integrals representing the primary and secondary energy in a transformer—that is, the losses. The watt-balance measures the ratio of the mean values of two definite integrals. It can therefore be used to measure the efficiency of a convertor, giving the result by a single reading.

The watt-balance consists of two electrodynamometer wattmeters, one above the other. The movable coils are rigidly connected in our instrument by a spiral-wound paper tube, and consist of 100 turns of silk-covered german-silver wire, No. 32 B. & S. gauge. The resistance, including leads, is 103 ohms; the diameter of coils, 2 cm. In series with the movable coils are two adjustable resistances, r_1 and r_2, as shown in Fig. 2. The stationary coils are arranged in pairs; each is 2.8 cm. in mean radius and contains 130 turns of No. 12 cotton-covered wire. They are movable along their axes, so that the factor of the instrument may be adjusted. The vertical distance between the two dynamometers is 30 cm. The movable parts are suspended by a silk thread inside a narrow paper tube to prevent disturbance by air currents, and directive force is given by four spiral springs, made of copper wire, 0.005 cm. in diameter. These springs serve as leading-in wires for the movable coils. The instrument is read by a telescope and scale.

In Fig. 2 is shown the scheme of connections for a hysteresis test. At the left the resistances for controlling the currents are shown. By the proper insertion of the connection, *C*, either a direct or an alternating current could be sent through the remainder of the apparatus, which in the main circuit consisted of an electrodynamometer, one pair of stationary coils, the specimen under test, a known resistance, *R*, of german-silver strip immersed in kerosene oil to keep it at a constant temperature, and the second pair of fixed coils. At one terminal of *R* a connection was made by means of a short piece of stout wire and a key, *K*; beyond the key the circuit branched, passing through the adjustable resistances r_1 and r_2, the proper movable coils, and returning one lead to the external terminal of the specimen, and the other to the corresponding terminal of *R*. The resistance r_1 was some hundreds of ohms, seldom falling below 300, and was more frequently in the neighborhood of 1,000; r_2 was kept at a constant value, 976 ohms. The resistances r_1 and r_2 were ordinary plug boxes, and the assumption was made throughout the work that the resistances of circuits r_1 and r_2 were so high in comparison with their inductances that no correction need be applied to the indications of the watt-balance. It may be well to mention that the use of high resistances constructed in the usual way by double winding may lead to serious errors in alternating current measurements on account of the capacity effects.

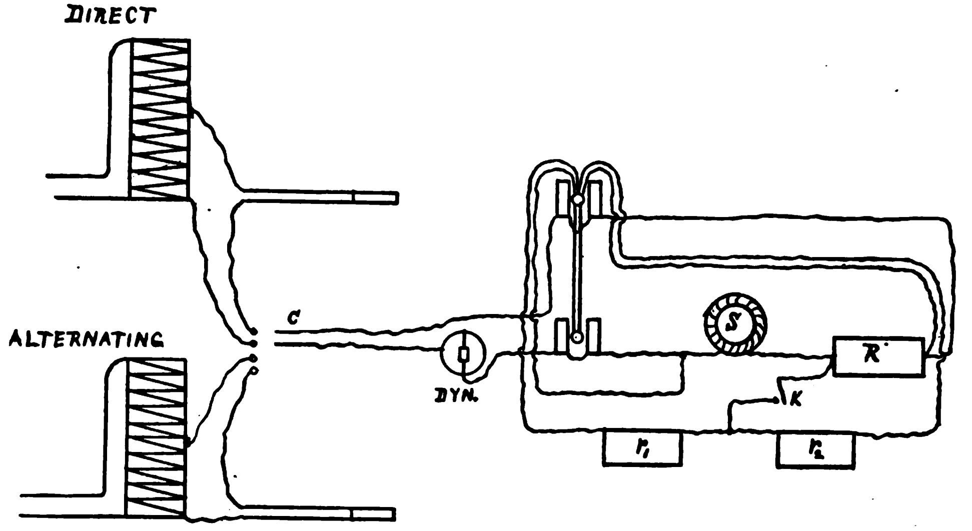

FIG. 2.

If the plug *C* be inserted so that a current flows in the apparatus, and no deflection is observed, then the factors of the upper and lower dynamometers are equal; if the key *K* is depressed, there will in general be a deflection, which may be reduced to zero by adjusting r_1, as a zero reading means that the average value of the products of the currents in the two coils of the upper and lower dynamometers are the same. It is known that the work in *S* bears the same ratio to the work in *R* that the total resistance in circuit r_1 does to the total resistance in circuit r_2. If the current is alternating, the work in *S* is of course divided between hysteresis and heating losses. No allowance has been thought necessary for the work done in the suspended coils. If W_s and W_R represent the work in the specimen and in *R*, then

$$W_s = W_R\left(\frac{r^1 + 103}{r^2 + 103}\right) = \frac{I^2\, R\,(r_1 + 103)}{r_2 + 103},$$

I^2 is given by the electro-dynamometer *DYN*.

To correct for the heating loss in *S* a direct current of any convenient magnitude is sent through the circuit, and a second balance, $r_1{}^1$ obtained,

$$R = 1{,}079 \text{ ohms}, \; r_2 = 976 \text{ ohms};$$

$$\text{so } W_s = \frac{I^2}{1000}\,(r_1 - r_1{}^1).$$

It will be seen that the watt-balance as used in the present case is a wattmeter with an electrodynamic control. The advantage derived from obtaining this control by shunting a portion of the main current is that any manipulation of the circuits does not disturb the equilibrium of the instrument, and that it renders it possible to use the instrument in a null instead of a compensation method.

As the hysteresis loss is a function of the maximum magnetization, denoted by *B*, it was necessary to provide some means by which the maximum might be kept constant and its value determined. The device sketched in Figure 3 was used for this purpose. In addition to the magnetizing coil, the specimen was provided with a winding of 24 turns, which was connected in series with an adjustable resistance of 874 ohms during the tests, and a galvanometer of 126 ohms. Leads were carried to the dynamo room, and terminated in brushes which rested on the edge of an ebonite disk 11 inches in diameter, fastened rigidly to the dynamo shaft; the brushes were carried by a radial arm, the motion of which is controlled by a small magneto-motor driven by three Leclanche cells. The motor was governed by a reversing key in the testing room, about 100 feet away. The alternator used had ten poles, thus making the length of a wave 72°. A piece of brass, 36° or one half a wave long, was set into the edge of the disk, and the whole carefully trued up. When the dynamo was in action the *B* current was closed once during a revolution, and for a time corresponding to one half a wave length. The galvanometer then performs the operation

$$\frac{2}{T}\int_{t^1}^{t^1+\frac{T}{2}} C\,d$$

1,500 times a minute. The value of this integral will be a maximum when it extends over the time between +*B* and −*B*. By the use of the key K^1 the brushes may be shifted, and the reading of the galvanometer brought to its greatest value. With the dynamo running at its normal speed a Leclanche cell, E. M. F. 1.4 volts, was inserted in the circuit; $R\,h$ was 1,374 ohms, and the deflection 21.2 cm.; with brushes short circuited and $R\,h$ equal to 14,874 ohms the deflection was 21.8 cm., the ratio of deflection being .972. If the brushes made perfect contact and there was no self-induction effect, the ratio would be unity, the entire cycle of operation being performed in a time short compared with the period of the galvanometer. During the tests the reading with $B\ h = 1{,}374$ was frequently repeated in order that the brushes might be kept in as uniform condition as possible.

---

* Contributions from the Physical Laboratory of the Massachusetts Ins. of Technology, in Proceedings of the American Academy. Presented by Charles R. Cross, October 10, 1894.

Owing to the manner in which the specimen is constructed, the area included in the B winding is but partially occupied by the iron. In calculating the approximate values of B no allowance has been made for this, as the permeability is high in the cases where B has been determined. If observations were taken at temperatures where the permeability was very low, it would be necessary to apply a correction for this unoccupied area. The values of B were calculated by the formula

$$B = \frac{E^1\ R\ D}{20\ A\ N\ n\ R^1\ D^1}.$$

D is the deflection corresponding to the value of B to be found. R is the resistance in circuit $R\,h$; N, the number of turns on B winding; n, the number of revolutions per second. A is the area of the iron included in the B windings. D^1 is the deflection of the galvanometer where an E. M. F. of magnitude E^1 and a resistance R^1 are inserted in the circuit $R\,h$, the dynamo turning at the normal rate.

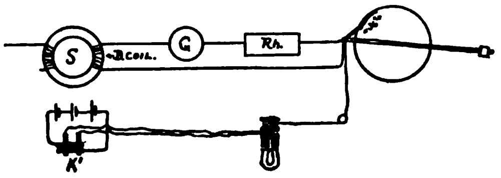

FIG. 3.

The furnace used for heating the specimen was built of fire brick, the external diameter was about 36 inches, height 18 inches. Inside the fire brick was a layer of asbestos wool 2¼ inches thick, kept in place by asbestos board, which was protected by thin sheet iron. The box containing the specimen was made of asbestos board about 1½ inches in thickness, and lined with retort cement. During the tests it was tightly closed. The furnace was heated by three blast jets made of gas pipe, the external tubes were ¾ inch inside diameter, the inner tube ⅜ inch. The supplies of gas and air were regulated by slide valves. The jets were directed into the furnace tangentially and with a slight upward inclination, the effect being to establish a good circulation and keep the interior of the furnace at a uniform temperature.

The specimen upon which the following tests were made was composed of so-called French steel, which showed on analysis the following impurities:

Manganese	0·535 per cent.
Phosphorus	0.013 "
Silicon	0.085 "
Sulphur	0.018 "
Carbon	0.970 "

The mass of iron employed was 628 grams. From this material, which was four one-thousandths of an inch thick, rings of 3 inches' outside and 2 inches' inside diameter were stamped, and the specimen formed by piling them. Each was insulated from its neighbors by a layer of pipeclay, applied as a sort of paint, the clay having been moistened with alcohol. Every tenth layer was insulated with mica. The pile so formed was wrapped with asbestos cloth, and the magnetizing coil of 36 turns of No. 14 copper wire wound on. The wire was insulated by winding it with asbestos twine. Interwound with the magnetizing coil was the B coil of 24 turns. These two windings formed on the outside of the specimen a single layer. The temperatures were determined by a Le Chatelier pyrometer, calibrated by known melting points. The hot junction was placed inside the asbestos wrapping resting against the iron, the leads were brought out through the usual double-cored fire clay tube; this was surrounded by a piece of gas pipe thoroughly wrapped in asbestos cloth, because in using this pyrometer in a case like the present, where the leads pass from the hot junction through a space at a higher temperature at a short distance from the junction, it is necessary to guard against conduction along the leads, and consequent errors in the temperature.

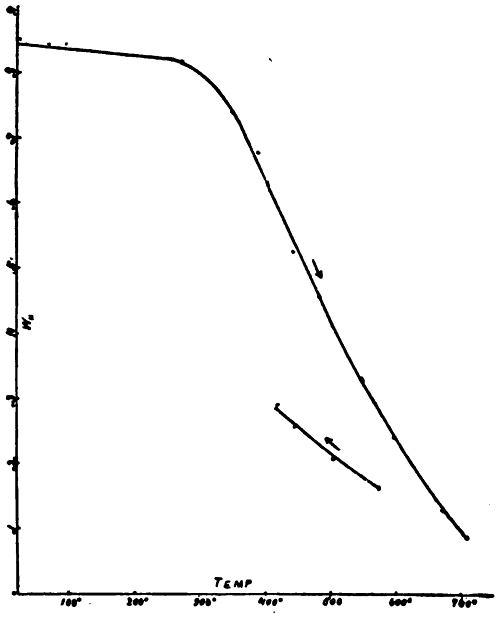

FIG. 4.

The manner of making the tests and the subsequent calculation was as follows. Owing to the construction of the furnace, the specimen being well shielded from the heat of the flames by the internal chamber, the air insulation, and its own asbestos covering, the temperature of the iron rises gradually; consequently the specimen will be at very nearly a uniform temperature. When a reading is desired, the alternating current is turned on, and the B deflection adjusted to its dynamometer reading and time observed; after a few minutes the observations are repeated, the temperature having risen in the mean time. This process is kept up until the iron loses its magnet-maximum value by K^1, and to its correct numerical value by varying the magnetizing current. Watt-balance resistance r_1 is now adjusted, and the pyrometer reading corrected for zero, and ism. Occasionally, a direct current was sent through the apparatus and the watt-balance, dynamometer, and pyrometer readings taken; these allow the value of $r_1{}^1$ in the hysteresis formula to be determined by making a plot, the co-ordinates being watt-balance and pyrometer readings; from the plot the value of $r_1{}^1$, corresponding to any pyrometer reading, may be read off. The electro-dynamometers were calibrated by sending a direct current through them, and measuring the P. D. at the terminals of a known resistance by projection against the E. M. F. of a Clark cell; the values of deflections and currents squared were plotted, giving straight lines. I^2 was determined by reference to these plots. The zero errors of the dynamometers employed were very variable, and were determined after each reading.

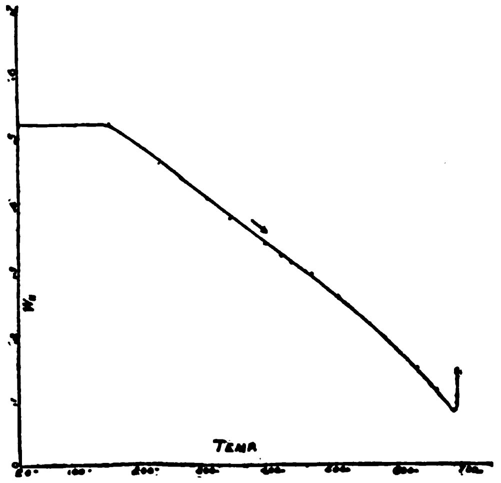

FIG. 5.

The results of the measurements will now be given. They are plotted as referred to at the beginnings of the several tables.

TABLE I.

FIRST HEATING: ASCENDING CURVE.

(See Fig. 4.)

B = 1970. $n = 125$. W_H = Hyteresis loss in specimen.

W_H.	Temp. °	W_H.	Temp. °
.852	28	.678	387

.258	511	.142	692
.228	555	.140	694
.167	593		

Inspection of the plots shows (Figs. 4 and 5) that for this sample of steel a moderate elevation of temperature up to about 270° has but a small influence on the hysteresis loss; that at this point a change takes place, and the diminution of hysteresis, with rise of temperature, is much more rapid, the decrease being such that at 675° the loss is but 13 per cent. of its value at ordinary temperatures. After heating above the inflection point, the specimen shows on cooling a marked decrease of the hysteresis loss from its value at the same temperature on the ascending curve. If the specimen be heated again, a change of direction of the curve takes place, but at a lower temperature. The second plot (Fig. 5) shows an increase of the hysteresis loss after the point of inflection has been reached. As only two heatings were made, we were unable to verify these observations, the results of which became apparent only when they were reduced. In addition to the expeiiment at high temperatures, the following observations were made. A specimen was made up and the loss measured at the ordinary temperatures; a mean of three measurements gave .289 watts as W_H. The specimen was then covered with a mixture of solid carbonic acid and ether; a mean of three measurements showed W_H as .288 watts, showing that there is practically no change of hysteresis for a diminution of temperature to about —80°.

Between the ascending and descending observations of the second heating, readings were taken for the purpose of finding whether the temperature at which the iron becomes markedly magnetic on cooling is the same as that at which the sudden diminution of the magnetic properties occurs on heating. Simultaneous readings of the *B* galvanometer and pyrometer were taken, the current remaining constant; no adjustment for maximum was made. The readings, together with some from the descending curve of the first heating, are given below, and, after being corrected for zero, are plotted in Figure 6.

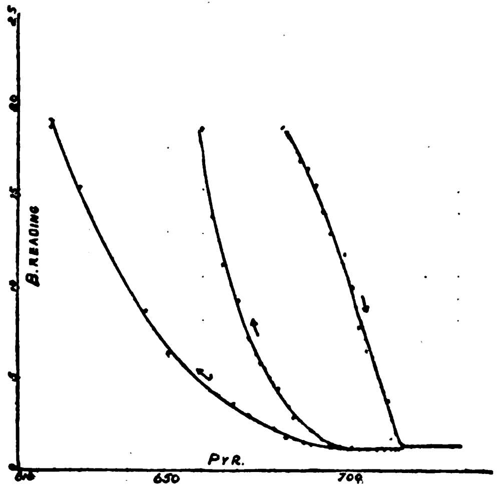

FIG. 6.

TABLE III.

First Heating.		Second Heating.

		38.7	7.01
		38.65	6.98
		38.55	6.95
		38.25	6.93
		37.85	6.90
		37.1	6.85
		36.5	6.84
		34.1	6.76
		32.7	6.73
		30.7	6.70

Fig. 6 shows that the two points do not coincide, that on the descending scale being about 12° lower than that on the ascending curve. The difference of form of the curves is noticeable, showing that the regaining of magnetic properties on cooling is more gradual than their loss on heating; the sudden exaltation of magnetic properties occurs at the same temperature in the first and second coolings.

At the time of this writing the research has not been fully completed. We are, however, now engaged on further experiments, and hope to present additional data in the near future.

An Apparatus for Measuring Difference of Phase Between Alternating Currents.*

BY LOUIS DERR, M. A., S. B.

Most of the methods hitherto employed for the measurement of difference of phase between alternating currents (*vide La Lumière Electrique*, March 10 and 17, 1894,) assume that the currents measured are truly sinusoidal in character, or demand exceptional conditions of steadiness. The method here described is applicable to the measurement of periodic currents of any form whatever, and can be used under any ordinary conditions.

The apparatus is a modification of that employed by Dr. J. Puluj for a similar purpose, and described at length in the *Elektrotechnische Zeitschrift* for December 1, 1893. Dr. Puluj's apparatus consists in brief of a pair of electromagnets, each carrying a flat steel spring at the free end of its core, a small mirror being mounted on the spring. A beam of light is reflected from one mirror upon the other, and thence to a screen. If alternating currents are sent through the magnet coils, the springs will be set vibrating, and the spot of light on the screen will be lengthened into a line if the springs are parallel; and if the springs be turned so that the vibrations are perpendicular to each other, the line becomes an ellipse whose dimensions afford a measure of the difference of phase between the currents in the coils.

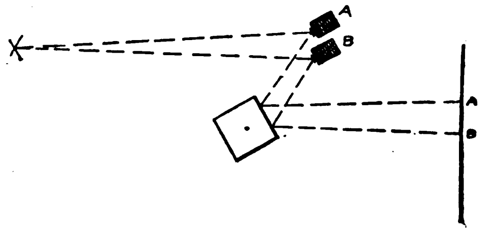

FIG. 1.

It is evident that to maintain an ellipse sufficiently stable to permit measurements of precision requires great steadiness in the currents, a condition not always obtainable. The springs give best results when their period of free vibration is that of the current or its octave, and slight changes of the current period will throw them out of tune, instantly affecting the amplitude of vibration, as the inertia of the moving parts is very small. Belt slip at the generator, irregular load or changes of steam pressure make precise measurements very difficult.

To obtain results without the steadiness demanded by the above method, the following modification was devised by the writer and successfuly used by Messrs. L. R. Nash and J. C. Nowell, of the class of 1894, in their thesis. The two electromagnets were placed side by side, and the beams reflected from their mirrors received upon a prismatic mirror and thence sent to the screen. This is shown in plan in Figure 1. In this case the spots of light which appear on the screen when the mirrors are at rest are elongated into two vertical lines when currents are sent through the magnets, and these lines are drawn out into curves which flash across the screen when the prismatic mirror is rotated. As the motion of the springs is harmonic, these curves are sine curves, and thus bear no necessary resemblance to the original wave form. Figures 2 and 3 show some of these curves, whose wave length is, however, much less than that employed in measurements.

The theory of measurements is as follows: If the spots of light on the screen are in the same vertical line when the prismatic mirror is at rest, the curves produced by revolving it will have the same time origin, and will be parallel if they are in the same phase. Any time lag of one behind the other will be shown by a lateral shifting of the lagging curve ahead of the other, and if a variable inductance is inserted in the circuit of *B*, the *B*-curve will be seen to move farther and farther ahead of the *A*-curve as the inductance is increased. The difference of phase is thus evident to the eye, and to obtain a direct measure of it requires only a knowledge of the angle through which one curve must be shifted to bring it into parallelism with the other. This is readily expressible in degrees by finding the angle through which *B* must be turned to bring *E* and *F* (Figure 4) into the same vertical, and then finding the angle through which *B* must be further turned to bring *G* and *E* into the same vertical, the first adjustment giving the portion of a wave length by which the two curves are separated, and the second the value of the whole wave length. Calling these quantities *c* and *d* respectively, the phase difference of the curves on the screen is, in degrees, $360^{c}/_{a}$.

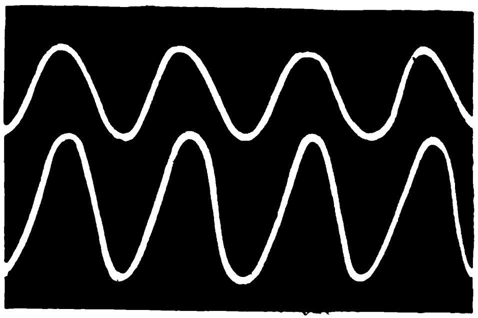

FIG. 2.

One consideration is to be noted here, that as the vibrating springs execute a complete vibration for every reversal of the current, their vibration frequency is just twice that of the current, and hence the phase difference of the curves on the screen is twice that of the currents measured. The desired value is thus $180^{c}/_{a}$

As *c* and *d* are too small to be directly measured with precision, a multiplying device is necessary. Mirror *B* is turned by a gear wheel meshing with a small pinion which carries a long pointer moving over a divided scale. With this device a wave length on the screen is covered by a displacement of 13 centimeters of the end of the pointer.

The procedure is as follows: With the prismatic mirror at rest, send the currents to be studied through *A* and *B* respectively. Turn *B* until the lines on the screen are in the same vertical, and take the pointer reading *m*. Start the revolving mirror, and when the curves are sufficiently elongated to permit convenient comparison turn the pointer until the curves are parallel, and take the reading *n* of the pointer. Turn the pointer still further until the *B*-curve has moved through an entire wave length and is again parallel to the *A*-curve, and record the new reading *p* of the pointer. Then the phase difference in degrees between the currents is

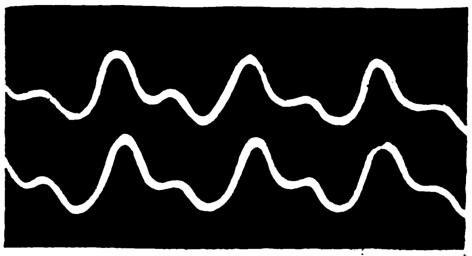

FIG. 3.

$$180\frac{m-n}{n-p}.$$

The result of these measurements plainly depend on the accuracy of bringing the curves into parallelism. This adjustment can be satisfactorily made by moving *A* vertically until the curves are brought close together. As used in the following transformer measurements, the mirrors were of silvered glass and the outlines of the curves consequently indistinct from multiple reflection. This makes the adjustment less precise than might be expected if metallic mirrors were used, and partially accounts for the relatively large deviation attached to the results below.

---

* From "Technology Quarterly," Vol. VII, No. 3, October, 1894.

Small Experimental Transformers.	Lag in Degrees.	Average Deviation.
Transformer with 4 secondaries, idle circuits open.	173.75	± 0.38
Transformer with 4 secondaries, idle circuit closed.	177.0	....
Ring transformer, overwound with iron wire....	172.29	± 0.82
Ring transformer, closed secondary......................	176.50	± 0.50
Two telephone induction coils in series................	332.11	± 0.84
Giving for each coil.........	166.06	± 0.42

The following measurement affords a comparison of calculated with known values. The apparatus was applied to the measurement of the lag between the branches of a three-phase circuit. Perfect symmetry in the dynamo windings would give 120° in each branch, and in any case the sum of the three lags should be 360°. The values actually obtained are 119.22, 120.44, and 119.44. The sum of these is 359.00, the average deviation (0.92) in this case being not far from the real error.

Among the advantages of the method described above are: (a) Since the wave form does not enter the calculation, any source of periodic current may be employed, whether sinusoidal or not; (b) slight changes in the electromotive force do not impair the measurements, for their effect is only to vary the amplitude of the curves, a quantity of small consequence; (c) constancy in the speed of the revolving mirror is unnecessary, since irregularity affects both curves alike and does not alter their parallelism; (d) the approximate value of the lag can be seen at once, as well as the quadrant in which it lies; (e) the curves need not fall successively in the same positions on the screen, as no measurements are made there, hence the speed of the revolving mirror need bear no definite ratio to that of the springs; (f) the apparatus is simple and easily constructed.

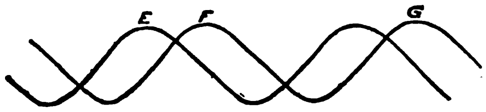

FIG. 4.

Fig. 3 shows the form of the curves produced when the free vibration of the springs is the octave of the current frequency. These curves were obtained from the three-phase circuit before mentioned.

New York Electrical Society.

The following are the officers elected at the Annual Meeting of the New York Electrical Society held on the 18th inst.:

President—John W. Lieb, Jr.; vice-presidents, Herbert Laws Webb, Edward Caldwell, Francis Forbes, Nelson W. Perry, Prof. L. H. Laudy, Prof. Morris Loeb; secretary—George H. Guy; treasurer—H. A. Sinclair.

There have been five deaths and eight resignations during the year; 33 members have been elected, and the net increase in membership is 20. The number of members now on the books of the society is 370.

Although last year the average attendance showed a marked improvement on the preceding year, during the season just concluded the society has had most gratifying evidence that its lectures have been on the whole even more thoroughly appreciated than ever. The range of subjects has been wide and in almost every instance the society has been fortunate in an able and exhaustive treatment of the theme selected. Some of the best lectures promised are still on the programme for next season, and will in all probability be delivered at an early date.

Frank E. Grover's 3,000-Volt Shock.

The resuscitation of a man who had sustained a shock of 3,000 volts of electricity has given the press and the electrical experts new ground for speculation as to the killing power of electricity. It is stated that on the evening of the 20th inst. Frank E. Grover, foreman of the Rochester Gas and Electric Company, while standing near the dynamo in the power house of the company, was thrown suddenly to the floor, and as he fell uttered a cry which was heard by the other station men present who rushed to his assistance. He was to all appearances dead, but the men determined, after sending for a physician, to try the D'Arsonval method of resuscitation, which they were more or less familiar with. They proceeded at once to produce artificial respiration by raising and lowering the arms in regular succession, at the same time pressing and releasing his chest. This was continued for nearly an hour before the arrival of the physician, Dr. Charles W. Wilbur, who had been summoned. Although Dr. Wilbur, after the usual tests, considered the man dead, he ordered the treatment continued, and shortly afterward, to the surprise of all, the patient began to show signs of life. A few minutes later natural respiration set in and the man was soon sufficiently restored to be taken to his home where his recovery was rapid. There seems to be some doubt about Grover's having received the full force of 3,000 volts, but the electricians at the station are confident that he was struck by quite or nearly that amount of current. Grover cannot account for the accident. He said to a reporter next day after the occurrence: "I don't think that I leaned against the dynamo, as I have been an electrician too many years to do so foolhardy a thing. I must have moved my arm in such a manner that it swept the brushes, thus coming in direct contact with the current."

Obituary.

News has just reached this city of the death at Folsom, New Mexico, of Henry W. Frye, formerly editor of the *Electrical World*. Mr. Frye was compelled to give up active work on the paper last winter by a severe attack of pneumonia from the effects of which he never recovered. About the first of January, on the advice of his physician, he sought relief in an entire change of climate, going first to Clayton and then to Folsom, New Mexico, where the invigorating and dry climate gave promise of restored health. His improvement was in fact marked and rapid for a while, but this proved to be but one of the familiar symptoms of the insidious disease, and a change for the worse recently set in resulting in his death on June 20.

His sister had been with him throughout his stay in the West and was at his bedside at his death. Alarmed at the recent sudden change for the worse she sent for her mother, who was on her way to join her son when she was met by the sad news of his death.

ELECTRICITY extends its most heartfelt sympathy to the bereaved mother and sister, and mourns with them a personal loss.

Too Heavy for Horses.

It is announced that the Budapester-Strassenbahn-Gesellschaft, which now works its lines by horses, is proposing to work its lines by electricity, and the Hungarian Board of Trade has given its provisional consent.

This new application of electricity to the driving of Budapesterstrassenbahngesellschaft is noted with pride and satisfaction.

LEGAL NOTES.

Judge Nelson, of the U. S. Court, has filed a decree in the suit of H. B. Moore, receiver of the Great Western Electric Company, insolvents, vs. E. C. Fowle et al., to gain possession of the electric works at West Duluth. He decides that Moore may have possession, but that Fowle cannot be mulcted for damages. Fowle, after his appointment as receiver by the federal court in Chicago, took no steps towards assuming charge in Duluth until Moore had been appointed receiver. The decision of Judge Nelson is satisfactory to the stockholders and people of Duluth as the management of the works is again in local hands. There will now probably be a big fight on the various conflicting claims against the company.

An action was on trial last week before Judge Bookstaver and a jury in the Common Pleas, brought by W. Preston Hix against the Edison Electric Light Company to recover $45,670 on a promoter's contract, whereby it is alleged the defendant agreed to pay Hix 15 per cent. of the capital stock issue of the Edison Electric Light Company of Philadelphia and 5 per cent. on any increase of its capital stock. The Philadelphia company was organized with a stock of $1,000,000, of which 35 per cent. went to the other company. Hix received $150,0 0 as his share of the original stock, and is now suing for his share of three separate increases in the stock of the Philadelphia Company of $2[illegible]0,000, $273,000 and $277,000 in the fall of 1892 and winter of 1898. The defence is a general denial. J. C. Tomlinson is for the plaintiff, and Eaton & Lewis with Joseph H. Choate of council for the defendant. The case not being finished on Thursday evening an adjournment was taken until Monday.

General News.

What is Going on in the Electrical World.

Fredericksburg, Va.—It is proposed to build a line of electric road from Milford to Bowling Green, in Caroline county.

New Britain, Conn.—The Central Railway and Electric Company's line to Berlin Center is completed and ready for public traffic.

Canton, Ill.—Gas is to be displaced by electricity in lighting Canton. The town has contracted for 115 powerful arc lights.

Goldsboro, N. C.—A company of Northern capitalists has been formed to build a railway from Goldsboro to Swansboro.

Chattanooga, Tenn.—The Chattanooga Electric Light Company has been awarded the contract for lighting this city for seven years.

Milwaukee, Wis.—The Clybourne street railway line is to be equipped with electricity, and the Sixth street line is likely to follow.

Lansingburgh, N. Y.—A special election will be held here July 1 to determine whether $13,000 shall be raised for lighting the streets with electricity.

St. Joseph, Mo.—An ordinance has been introduced in the city council granting an electric street railway franchise to W. A. Kellond and W. T. Van Brunt.

Butte, Mont.—The Butte Electric Light Company has decided to consolidate the Butte and Silver Bow plants in one hereafter, in the interest of economy.

Portsmouth, N. H.—The board of aldermen has granted permission to the Portsmouth Horse Railroad Company to use electricity as a motive power on their lines.

Charlevoix, Mich.—The council has contracted with Charles Gabriel, of Saginaw, to put in electric lights on a 10-year franchise. Work will begin immediately.

Cortland, N. Y.—The Cortland and Homer Traction Company have secured the right of way over their entire branch connections, and will begin work on them at once.

Atchison, Kan.—The lease of the equipment of the Atchison Railway, Electric Light and Power Company to B. P. Waggener and C. S. Hetherington has been filed.

Portland, Conn.—All the stock in the proposed electric street railway has been subscribed. Charles F. Parks, of Boston, is largely interested in the new company.

Toledo, O.—The Consolidated Street Railway Company intends as soon as a proper site is obtained, to erect a magnificent new power house at a cost of over a million dollars.

Syracuse, N. Y.—Franchises have been granted by all the towns on the route of the South Bay Electric Road and work on the line may be commenced this summer.

Erie, Pa.—It is reported that a company has been formed to build an electric street railway from Erie to North East. Frank L. McLaughlin, of North East, is interested.

Rockville, Conn.—The surveyors for the Hartford, Manchester and Rockville Electric Railway have the route for the road staked out from Manchester to this city.

Scotland Neck, N. C.—The stockholders of the new electric light company have appointed Mr. A. McDowell a committee to correspond with the various concerns that furnish plants.

Bath, N. Y.—It is reported that an electric road is to be built between Bath and Hammondsport. Some Buffalo capitalists have been looking over the ground with that purpose in view.

New Orleans.—John F. Buckley has invented a hydraulic elevator to be operated by an electric motor which it is claimed has all the virtues of the old hydraulic but none of its defects.

Dover, Del.—The town council has passed a resolution granting the Hilford-Dover Electric Railroad Company the privilege of laying tracks and erecting poles on the streets of Dover.

Charleston, S. C.—F. W. Wagener & Co. expect to extend their electric light plant by adding a 100 horse-power engine and a 100 horse-power boiler and additional electric machinery.

Hamilton, N. Y.—The contract for lighting this village by electricity has been let to the Western Electric Company, and it is expected that the system will be in operation by August 1.

McKeesport, Pa.—The trolley line between Pittsburg and McKeesport has been formally opened to traffic. The line is 10¼ miles long, and the trolley cars make the trip in about 45 minutes.

Newburg, N. Y.—A syndicate, including the Newburg Electric Light and Power Company, has purchased the controlling interest in the stock of the Edison Electric Illuminating Company of this city.

Baltimore.—Mayor Latrobe has signed the ordinance for the creation of an electric commission, whose duty it shall be to report upon a plan of subways for placing all wires in the city underground.

Woburn, Mass.—The car houses of the East Middlesex Street Railway Company were destroyed by fire on the 15th. Thirty-five street cars were burned, and the total loss is estimated at about $40,000.

Boston, Mass.—A few days ago a trial was given the new electric branch of the New York, New Haven and Hartford Railroad at Nantasket Beach. The results were highly satisfactory to those who witnessed the test.

Mt. Clemens, Mich.—The Mt. Clemens Street Railway and the Lakeside Company have effected a consolidation. This means an electric system all over the city and to the lake in place of the present horse car service.

Alton, Ill.—President J. F. Porter of the Alton Electric Street Railway has purchased all the old lines of street railway here and will improve their equipment and operate the combined systems under one management.

Youngstown, O.—A 20-year franchise has been granted by the city to the Youngstown Park and Falls Electric Street Railway, in which Pittsburg parties are stockholders, and the construction of the line will be commenced immediately.

Seattle, Wash.—The Consolidated Street Railway Company's power house was burned on the 2 th inst. Twenty-five cars were destroyed. The electric plant, said to have been the most complete in the Northwest, is in ruins.

Ridgewood, Ill.—David Chirrin of this place is the inventor of an electric camera. It can be attached to the telephone or any other electric instrument or circuit, its object being to reproduce a photograph of the persons speaking to each other.

Belleville, Mich.—It is stated that capital is being rapidly subscribed at Chicago for the scheme of building a dam in the Huron River near this place, the power to be used in the manufacture of electricity to be transmitted to Detroit and elsewhere.

Pekin, Ill.—The Pekin Electric Light and Power Company has agreed to absorption by the Pekin Gas Company, and both companies will be merged under one management. The chances are that a new electric light company will be started in Pekin.

Allentown, Pa.—The Old Colony Trust Company of Boston has filed a bill in equity to foreclose a mortgage of $200,000 against the Allentown and Bethlehem Transit Company and allied corporations. The appointment of a receiver is asked for in the bill.

Sheboygan, Wis.—The common council has passed the bill granting the Electric Lighting Company the contract for lighting the city for ten years at $95 per lamp over the veto of the mayor. The building of the electric street railway will be commenced at once.

Vicksburg, Miss.—Proposals will be received at the Mayor's office until 7:30 P. M., July 15, for the lighting of the city of Vicksburg with 81 arc electric lights, 1,200 C. P., and 34 incandescent electric lights, 50 C. P., for periods of three years and of five years.

Chautauqua, N. Y.—The matter of building an electric railroad from Chautauqua to Mayville by way of Duquesne Lawn Resort is being pushed by a number of Mayville citizens. Among those interested are Postmaster Burns, W. F. Fisher, Judge Van Duzen, George W. Hewes and others.

Greenwich, N. Y.—Plans for an electric railway between Greenwich and Schuylerville are progressing, and active steps are being taken in Greenwich for commencing and rapidly pushing the work. Engineer Reeves Smith, of Troy, will complete the survey at once.

St. Louis, Mo.—E. J. Thurman and W. D. Waters of St. Louis, and J. B. Clayton of Fenton, Mo., have been granted a charter to construct and operate a double track electric railway from St. Louis to Morse Mill, a distance of thirty-five miles. Capital stock $500,000.

Montreal, Can.—An electric railway is planned to run through many of the country parishes of this province. Directors: Gen. Rielley, United States Consul, Ottawa; James Fowler, United States Consul at Charlton Place, and Thomas Henry, Canadian Agent of the Northern Pacific.

Niagara Falls.—The plans for the Niagara Falls, Wesley Park and Clifton electric railroad call for about eight miles of single track with necessary switches, turnouts, etc. The company comprises ex-Mayor Manning of Toronto, Messrs. Blake, Lash and Cassels of that city, and several New York capitalists.—The general meeting of the American Institute of Electrical Engineers which was begun here yesterday attracted members from all over the country. During the convention it is proposed to visit, among other objects of engineering interest in the vicinity, the new works of the Niagara Falls Power Co., which has "put the Falls in harness," and the Park and River Railway on the Canadian side, also the great central station of the Buffalo Electric Power Co.

Reading, Mass.—The project of organizing a new company and building an electric railroad from Reading to Lowell, it is stated, will soon materialize. Col. C. F. Woodward, president of the Wakefield and Stoneham Street Railway Company, is said to be interested in the new enterprise and has practically completed all the preliminary arrangements.

Stockton, Cal.—The survey for an electric railroad between Stockton and Lodi is finished and the work of grading for the roadbed has begun. The enterprise is being pushed by ex-Congressman James A. Louttit, Harry C. Bunn of Chicago and Mr. Hartzell, who was at one time connected with the San Mateo Electric Railway.

Atlanta, Ga.—The *Constitution* states that "George E. Wood, electrician of the Fort Wayne Electric Corporation, has been in Atlanta for several days putting in the celebrated low speed dynamos for the Georgia Electric Light Company. He is a brother of the justly celebrated James J. Wood, who invented this wonderful piece of electric machinery."

Philadelphia.—At a meeting of the directors of the Electric Traction Company it was decided to increase the capitalization to the full amount authorized, $8,750,000, by the issue of 22,604 additional shares of a par value of $50 each. The money thus obtained, amounting to a little more than $1,100,000, will be used to pay for prospective extensions of the company's system.

Cincinnati, O.—A special meeting of the stockholders of the Cincinnati, Hamilton and Dayton Railroad is called for July 8, at Cincinnati, the object being to vote upon the question of consolidating all the properties now included in the system. This will unite the Cincinnati, Hamilton and Dayton, the Cincinnati, Dayton and Ironton, and the Cincinnati, Dayton and Chicago.

Pittsfield, Mass.—It is understood here that the electric railway which has been started from Troy to Sandlake will eventually be continued to Pittsfield, Sandlake being about half way between the two cities. The whole distance from Troy to Pittsfield by road is only 33 miles, and an electric line would strike several towns which have no good railroad facilities now.

Canastota, N. Y.—William H. Patten and other capitalists of this village have acquired an interest in the Marvin Electric Drill Company of Syracuse, and have arranged to have the factories of the company removed to Canastota. The company will manufacture electric percussion drills and dynamos for their operation under the patents of H. N. Marvin, formerly of Syracuse, and now of this village.

Stevens Point, Wis.—Negotiations have been in progress for some time looking to the consolidation of the Clark Water Power property and the Electric Lighting Company. If the deal is consummated, a new electric power house will be built at the dam to furnish power for the lighting plant and for the prospective city railway. The new company may see fit to establish several manufacturing plants in that immediate neighborhood.

Topeka, Kan.—The Brush electric light plant of Topeka has been sold to Cleveland parties, one of whom is Mr. Hazard, a banker. A former shareholder stated to a reporter: "Cleveland, O., is the home of the Brush light, and plants similar to the one in Topeka were being purchased by the same parties in many other cities, possibly with the intent of getting all of the Brush electric light plants under one management."

Mason City, Iowa.—T. S. Roberts, a local capitalist, has purchased a controlling interest in the Mason City Electric Light plant, and there has been a reorganization. M. I. Clark was elected president, T. S. Roberts secretary and treasurer, and W. P. Fitch manager. They expect at once to put in an electric street car line connecting all the depots of the city, and it is contemplated to soon put in a line connecting Clear Lake and Mason City, a distance of ten miles.

Brooklyn, N. Y.—The board of aldermen have adopted a resolution directing the park commissioners to advertise for proposals for lighting the Ocean Parkway with electricity for a term of three years.—At a special stockholders' meeting of the Edison Electric Illuminating Company of Brooklyn, on the 19th, the capital stock of the company was increased $750,000 to $3,750,000. The directors were authorized to issue additional bonds to the amount of $500,000 for the purpose of purchasing the capital stock of the Citizens' Electric Illuminating Company and for extensions of the combined plants.

Rockdale, Milam Co., Tex.—A number of the leading citizens are taking an active interest in the proposed electric street railway. J. R. Rowland, one of the most substantial merchants, is taking the lead in the matter. R. H. Ames, manager of the electric plant, is also interested. Plans have been drawn up and estimates made on both a regular railway and an electric line. The line is to be extended northwest to Elm Grove, in Williamson county, a distance of twenty miles, and will follow up the valley of the San Gabriel the entire distance.

Chagrin Falls, O.—The Cuyahoga Suburban Railway Company has secured the entire right of way from Randall, where work is progressing on the new electric line to this place, and has applied for the franchise. As soon as this is granted the company will begin work, after increasing its capital stock from $50,000 to $150,000. Solicitors of the line running from Kinsman to this place to connect with the Cuyahoga Suburban Railway line are securing the right of way rapidly. E. M. Yeomans, of New York, now proposes to push the line on through to Meadville, Pa., which will make a continuous railway through unexcelled farming country from Meadville, Pa., to Cleveland.

Buffalo, N. Y.—Buffalo capitalists have a project on foot to build an electric road to Gardenville, to be called the Buffalo and Gardenville Electric Railway. The capital stock is to be $20,000, and efforts are now being made to get the matter in such shape that the building of the road may soon be commenced.—The Niagara Falls Power Company has refused to accept the franchise offered by the city of Buffalo. The company objects to certain restrictions, among them the time limit of 25 years instead of 40, and fixing the price of power within the city.—Governor Morton failed to sign the bill permitting Alonzo C. Mather to erect an experimental bridge and turbines on the Niagara River for the purpose of developing electric power.

Knoxville, Tenn.—Sealed bids will be received by the board of public works at their office in Knoxville, Tenn., until July 11, 1895, at 2 o'clock P. M., for lighting the city with electricity or gas. For 200 arc lights 2,000 candle power each, all night service; or 800 to 1,000 gas lights of 18 to 20 candle power. Either contract to run for the term of five or ten years. All bids must be based upon the form of a contract which may be had upon application. Also, bids will be received for the erection of an electric light plant to be paid for in yearly installments in five or ten years, the city to take charge of and operate the same within thirty days after completion. Certified check for $1,000 must accompany each bid.

Telephone and Telegraph.

The Select Council at Philadelphia has refused to reconsider the Drawbaugh Telephone bill.

Suits are now pending in Philadelphia against a number of telegraph and telephone companies for license fees, amounting in the aggregate to $100,000.

The Richmond and Huntington Telephone Company was organized lately at Richmond, Vt.; capital stock, $15,000; officers: President, A. E. Ellis; secretary, J. C. Sibbins.

The Oberlin Telephone Company, of Oberlin, O., proposes to construct a magnetic telephone line across Ohio. Its capital stock is $19,000. W. H. Pearse, F. L. Fuller, E. S. Johnson and W. B. Dodoritha are the incorporators.

The common council of Battle Creek, Mich., has voted to put in signal and telephone boxes.

There is a fair prospect of a telephone franchise being granted the Mutual Automatic Telephone Company at Syracuse, N. Y.

The Framingham Telephone Company of Framingham Mass., has secured a franchise for that town and will also furnish service at Natick. The corporation is capitalized at $15,000.

The Asbury Park Mutual Telephone Company, of which Washington White is president, has been granted the right to construct a line in Ocean Grove. Work will be begun at once.

Thos. M. Ferguson has been granted a franchise to construct a telephone line at Meridian, Miss.

A number of Rochester, N. Y., capitalists, among them Frederick Cook, Max Brickner, James Fee, Edward Peck and William C. Barry, have applied to the common council of Rochester for a telephone franchise. It is proposed to enter into active competition with the Bell Company at much lower rates than those of the latter company.

Charles E. Johnson will construct a telephone line from Raleigh to Hamlet, N. C., a distance of ninety-six miles.

The Carbondale Telephone Company, now in progress of organization by members of the board of trade of Carbondale, Pa., has petitioned the council for leave to establish a telephone system in that city.

It is stated in a Madison, Wis., despatch that "the Standard Telephone and Electricity Company of Madison have closed a contract with the Western Electric Telephone Company of Britt, Ia., for 10,000 telephones, with Milde non-infringing transmitters. This is said to be the largest order ever placed for telephones in the United States."

The telephone company recently organized at Binghamton have protested against the restrictions imposed in the franchise prepared by the city council.

The Newark Mutual Telephone Company has been incorporated with a capital stock of $300,000. The incorporators are Ernest J. Foord of Jersey City, P. Justus Atkinson of New York City, and Samuel L. Boyd of Brooklyn, N. Y.

The New Harrison Telephone Company perfected its organization at Grand Rapids. Iowa, by electing as officers: President E. B. Fisher; vice-president, C. B. Rood; secretary, Amos S. Muzzleman. The company will at once place $30,000 more bonds on the market and immediately after July 4 will begin building the exchange.

Edward P. Meany, Melville Egleston, James E. Caldwell, Leland Hume and T. Dwight Webb have taken out a charter at Nashville, their purpose being to construct and operate telephone lines and telephone exchanges as the American Telephone and Telegraph Company of Tennessee.

The Columbian Standard Telephone Company, the branch of the Standard Telephone Company for Maryland, the District of Columbia, Virginia and West Virginia, has been formally organized, and will soon begin active operations. The headquarters of the local company will be in Washington, with branch offices in Baltimore and Richmond.

A Racine, Wis., dispatch states that a new telephone company has been established at Western Union Junction, Wis., to operate a line between that place and Somers, Kenosha County, and will eventually extend to the other towns in the two counties. The capital stock is $5,000 and the officers are: President, C. A. Brown; secretary, Frank Lingsweiler; treasurer, Dr. Stonebreaker.

At the Convention of Railway Telegraph Superintendents, held on the 18th inst. at Montreal, Can., several papers interesting to the fraternity were read and discussed. The election of officers resulted as follows: J. B. Leonard, president; J. W. Fortune, vice-president; P. W. Drew, secretary-treasury. Fortress Monroe was chosen as the place at which the Convention will assemble in July, 1896.

A new telephone company, entitled the Commercial Telephone Company, has been incorporated to do business in the county of Alameda, Cal. The directors are E. R. Smith, Albert L. Stetson, J. D. Johnson, John W. Butler and S. P. Lunt. The capital stock is $100,000, $50,000 of which has been actually subscribed. The new company contemplates establishing connections in San Francisco.

Judge A. C. Coxe of the United States Court has granted an order in the case of the American Bell Telephone Company of Boston against the Baxter Overland Telephone and Telegraph Company of Utica, N. Y., which gives the latter the privilege of withdrawing its exhibits from the files of the court, the patents of the plaintiff having expired. This practically amounts to a dissolution of the injunction which has existed against the Baxter Overland Telephone and Telegraph Company for seven years and that company is now making preparations to resume business.

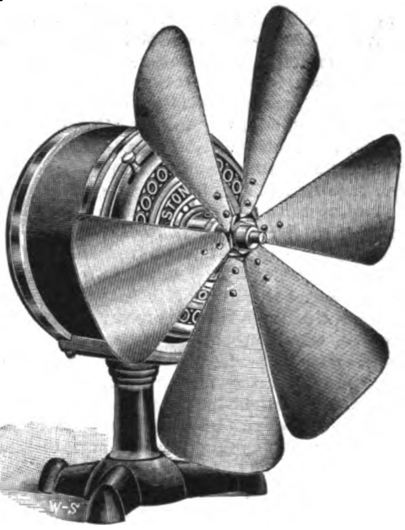
At a meeting of the Board of Managers of the Bell Telephone Company in Philadelphia on the 18th, Messrs. Merrihew, Gill, Tinker, Clark, Westbrook and Plush resigned, and C. J. French and Thomas Sherwin, of Boston, Mass.; Francis B. Reeves and Joseph E. Gillingham, of Philadelphia; J. King Goodrich, of Pittsburg, Pa., and Edward J. Hall, of New York, were elected to fill the vacancies. John E. Hudson, of Boston, was elected president, A. A. Ziegler, of Philadelphia, treasurer, and Samuel B. Huey, of Philadelphia, secretary and solicitor. The retiring members of the old board represented the controlling interest in the stock held by the Western Union Telegraph Company, which has been sold to the American Bell Company of Boston. General Eckert is the only officer of the Western Union Company who continues in the present management.

A novel ceremony was held in the office of the Maryland Trust Company in Baltimore one day last week. It was the counting of the contracts of the Home Telephone Company. This company has 3,400 contracts with the citizens of Baltimore to take its telephone service for three years at $36 and $48 per year. The public counting of contracts was held to show the people of that city that the new company means business. The counting was done by a committee of the leading business men of the city, after which lunch was served. The Home Telephone Company has purchased a franchise which gives it full right to extend its lines through the streets and conduct a telephone business in Baltimore. This franchise was originally from the Maryland Legislature for the Writing Telegraph Company, in which the Abells were interested. This company was formed for the purpose of applying a patent to the reproduction of writing by electricity, but it never did any practical work and the projectors sold the franchise to the Home Telephone Company.

10,000 Meston Fan Motors.

The rapidly revolving blades of 10 000 Meston alternating current fan motors now help to make life more endurable during the heated term in various sections of the country. The Emerson Electric Manufacturing Company, St. Louis, Mo., manufacturers of these motors, report that the sales to date have aggregated the above number and that the second 10,000 has already been started upon.

The accompanying illustration shows the model of 1895, with improvements.



The Meston fan motors are sold on the following guarantee:

"We guarantee our motors to be perfect in every detail of design and construction, and we will be responsible for all repairs not due to carelessness or accident, including brush renewals, if any should be necessary, for three months from date of purchase."

Wagner Fan Motors.

The Wagner Electric Manufacturing Company, St. Louis, report that the demand for their new fan motors has been so great that they are nearly three weeks behind in orders. Several large transformer contracts have been closed recently. The company's factory is running with full force. The prospects for a large fall trade are very bright.

Spread of Electric Street Lighting.

That there is a steady demand for both outdoor arcs and incandescents is shown by the rate at which George Cutter, of Chicago, is supplying his Lamp-supporting Pulleys and his Streethoods The demand for these has kept up steadily month after month.

BUSINESS HINTS.

Public Buildings, Theaters, Residences, &c., Proposed or in Course of Construction.

[The following summary is prepared weekly for ELECTRICITY for the information of advertisers and readers who are dealers in apparatus and articles required in the electrical equipment of public and private buildings.]

Boston, Mass.—A six story building is to be erected at Elliott and Pleasant sts., by Wm. A. Miller.

Buffalo, N. Y.—J. P. White will build a three story brick and terra cotta dwelling, on North st. near Elmwood ave., to cost $35 000....Charles H. Williams will build three story brick dwelling at 6[illegible]2 Delaware ave., to cost $72,000.

Cambridge, Mass.—Hartwell & Richardson, of Boston, have prepared plans for the Cambridge Y. M. C. A. building, to cost $100 000.

Charleston, S. C.—W. T. Keogh will expend $150 000 in remodeling the Academy of Music.

Chicago, Ill.—Alexander Davidson intends building a theater next to the Great Northern Hotel on Quincy st., to be called the Great Northern, cost $1,000,000.

Coney Island, N. Y.—A club house is to be erected at Norton's Point, to be equipped with all modern improvements; Architects Lord & Newett, 123 East 23d st., New York.

Galveston. Tex.—Plans of a Y. M. C. A. building, to cost $50,000, have been prepared by C. W. Bulger, and its construction is to begin at once.

Hornellsville, N. Y.—Hornellsville has just voted $30,000 for a new court house and city hall.

Kingston, N. Y.—The new factory for the Cunningham Manufacturing Company will be erected on a plot between Gage st. and Fonhall ave.; it will be lighted by electricity.

Kissimee, Fla.—W. L. Van Duzor & Co. have effected a sale of a plot of land to Northern capitalists for hotel site. Work on the buildings, etc., will be commenced July 1. The structure will contain 150 rooms, fitted up with all modern improvements, electric lights, etc.

Marco, Fla.—W. P. Neal and W. B. Collier contemplate building a hotel on Marco Island.

Melrose, Mass.—Melrose Athletic Club will erect a handsome club house on site of present structure, cost $20,000; Architect Fred Ellis.

Menominee, Mich.—The new opera house which it is proposed to build here will have a seating capacity of 1,500.

New York City.—An office building, sixteen stories in height, is to be erected on the site adjoining the Field building, at the lower end of Broadway, Architect Richard M. Hunt, 1 Madison ave....Mercantile building, six stories and basement, at 265 Bowery, all modern improvements, Architects Schneider & Herter, 48 Bible House.... Four story building for Association of the Bar, south side of 44th st., east of 6th ave., to cost $350,000, Architect C. L. W. Eidlitz, 100 5th ave....Metropolitan Life Insurance Co. will erect a building on 4th ave. near 23d st., site of the Lyceum Theater....Union League Club will expend $10,000 on improvements to club house....A six story building will be erected by a syndicate at 39-43 West 42d st., opposite Bryant Park....Plans have been filed for a six story Maternity Hospital building to be erected at Amsterdam ave. and 59th st. by Wm. Sloane, 642 5th ave.... A magnificent mansion is to be erected at West 55th st., a plot from St. Luke's Hospital grounds....The block fronting on Riverside Drive, from 74th to 75th st., has been sold to ten individuals under an agreement that each is to build a dwelling of the better class; plans for these houses have been drawn by Architect C. H. P. Gilbert, 18 Broadway, and they call for 10 five story American basement dwellings, to be finished in hard wood, heated by steam and lighted by electricity....Flats, Apartments, etc.: Four story building, 44 West 24th st., Architect A. E. Barlow; five story apartment house, St. Nicholas ave. and 181st st., to contain latest improvements, Architect John C. Burne, 161 West 42d st; 4 four story dwelling houses, south side of 77th st., west of West End ave. by W. E. Thompson; seven story apartment house, northeast cor. 68th st., plans prepared by George Kerster, 110 West 34th st.; 2 five story flats, north side of 119th st., west of Park ave., Architects Neville & Bagge, 215 West 125th st.; the same architects are about to file plans for a five story double flat, north side of 111th st., west of 8th ave.; six story tenement with store, northwest cor. Stanton and Pitt sts., Architect Charles Rentz, 153 4th ave.; 2 five story apartment houses, north side of 126th st., east of Columbus ave.; five story flat, 852 First ave., by Randolph Guggenheimer and Solomon Marx; 2 four story dwellings, south side of 76th st. west of West End ave., Architect Henry F. Cook, 964 Columbus ave.; four story dwelling, south side of 86th st., east of West End ave., Architect C. P. H. Gilbert, 18 Broadway: four story dwelling, 75th st., east of Madison ave., by A. G. Gersten, 56 East 25th st.

Philadelphia, Pa.—Wm. Schollenberger, Jr. will erect a three story factory building at northeast cor. of Mascher and Oxford sts....George B. Davis, merchant, of West Philadelphia, is about to erect a building at 3930-3932 Lancaster ave., lighted by electricity....Allen B. Rorke is to erect a handsome residence for himself at 131 South 18th st. to be four stories....Charles McCaul is receiving estimates on a handsome six story fire proof building, to be erected at northeast cor. of 10th and Sansom sts. Mr. McCaul also contemplates erecting a six story store and factory building on property recently purchased by him, 10th st. south of Market.

Pittsburg, Pa.—James McKay will erect an eight story brick building, 25 x 110, at 1005 Liberty ave., to cost $26,000....A new play house is to supplant the old Harris theater; Harry Davis will probably be the lessee and manager.

Poughkeepsie, N. Y.—The trustees of Vassar College are to build a $25,000 residence for its president and a new $100,000 building for the college.

Syracuse, N. Y.—Thomas Hogan, who owns the site formerly occupied by the United States Hotel, at West Fayette and Franklin sts., is having plans drawn for five story brick block to cover the entire site.

Worcester, Mass.—It is understood that Charles L. Nicolls contemplates the erection of a six story flat building adjoining the Plymouth church property.

INCORPORATIONS.

The Fawkes Electric Manufacturing Company, Denver, Col.—to manufacture, sell and deal in electrical machinery, etc., under patent rights. Capital stock, $600,000. Promoters: Geo. P. Blair, Sydney Williams, John R. Smith all of Denver.

The Marion Water Company, Portland, Maine—to construct and maintain water works, gas works and electric works in Marion, Ohio. Capital stock $250,000. Promoters: Chas. J. Chapman, Cullen C. Chapman, Rob't Chapman, Portland; C. E Burke, Cleveland, O.

The Hammond Lighting Company, Chicago, Ill.—to furnish light, heat and power, by use of steam, gas and electricity; acquire, purchase and operate electric, gas, and steam franchises, etc. Capital stock, $210,000. Promoters: Wm. P. Engel, Chas. F. Griffin, E. Barnhart.

The McKeesport and Port View Passenger Railway Company, McKeesport, Pa.—to construct and operate an electric railway at McKeesport. Capital stock, $18,000. Promoters: R. T. Carothers, T. D. Gardner, J. W. Allig, McKeesport.

The Maywood and Proviso Electric Light and Power Company, Chicago, has increased its capital stock to $60,000.

The Badt Multiphase Electric Railway Company, Chicago. Capital stock, $1,000,000. Incorporators: William A. Aylsworth, James C. Essick and Adolph Gray.

The Hall Electric Power and Reduction Company, Des Moines, Iowa—to buy and sell, to own and operate and to build and equip electric lighting and gas plants and to sell all kinds of electric and gas appliances. Capital stock, $500,000. Incorporators: Thurston Gardner Hall, Truman Miles Hall and Robert H. Laird.

The Washington and Tyler Electric Light and Power Company, Washington, Pa. Capital stock, $10,000. Directors: Arthur Kennedy, Francis J. Torrence, of Allegheny; Thomas R. Hutchinson, of Pittsburg; John N. Murdock and John W. Vester, of Washington.

The Atchison Railway, Light and Power Company, Atchison, Kan.—to build and construct electrical street railway and electric power for light in the city of Atchison. Capital stock, $200,000. Promoters: Jas. W. Orr, R. B. Morris, E. C. Post, R. L. Pease, Atchison.

The Wizard Telephone and General Electrical Manufacturing Company, Council Bluffs, Ia.—to build, equip, maintain and operate telephones, telephone exchanges and lines. Capital stock, $100,000. Promoters: J. C. Willow, J. E. De Lee, Eli Brown, Council Bluffs.

The Springfield Traction Company, Springfield, Mo.—to build and operate street railways. Capital stock, $400 000. Promoters: S. W. Fordyce, Geo. W. Barker, Moses Rumsey, R. C. Kerens, St. Louis, Mo.; C. B. McAfee, J. F. G. Bentley, Springfield.

The Standard Electric Company of Chicago has increased its capital stock to $1,500,000.

The Western Electric Telephone Company, Britt, Hancock County, Iowa—to build, own, manage and lease telephone lines in Iowa. Capital stock, $100,000. Directors: J. F. Cass, of Sumner; Charles Webster, of Waucoma; T. A. Potter, of Corinth; Thomas A. Way, of Britt, and S. A. Way, of Wesley, Iowa.

The Amplified Electric Company, East St. Louis. Capital stock, $1,000 000. Incorporators: Frederick Ulrich, Edwin J. Paule, John T. Dodwell.

The Jacobson-Blosser Electric Company, Portland, Maine—to manufacture and deal in all kinds of tools and machines. Capital stock, $ 00,000. Promoters: J. Lestor McLean and Edward B. Jackson, Boston; Alfred Pinal, Quincy, Mass.

The Portland Suburban Railway Company, Portland, Ore.—to own and operate a city and suburban railway, either and both electric and animal power; own water systems, real estate, etc. Capital stock, $2,500,000. Promoters: James M. Lively, Ezra D. Baker, Portland; L. D. Lively, Athena Ore.

The South American Light, Power and Traction Company, Beatrice, Neb.—to establish plants for and furnish light to municipalities and individuals, from gas and electricity. Capital stock, $1,000,000. Promoters: A. S. Paddock, Robert S. Forbes, Edwin W. De Leon, Samuel H. Guggenheimer.

The Little Rock Traction and Electric Company, Little Rock, Ark.—to own, purchase and construct street railways in the city of Little Rock and furnish the said city with light, etc. Capital stock, $500,000. Promoters: Samuel Carr, R. T. Paine, Jr., Isaac T. Burr, Allston Burr, Arthur Perry and Francis Peabody.

The People's Light, Heat and Power Company, Denver, Col., and Hastings, Neb.—to construct an electric light plant in the town of Hastings, Neb. Capital stock, $ 00,000. Promoters: Wm. H. Brevoort, Chas. F. Lacombe, Samuel S. Campbell, Denver.

The Central California Electric Company, Jersey City, N. J., and New York City, N. Y.—to manufacture and construct plants, machinery, generators, etc., for the manufacture, use, distribution, etc., of electricity. Capital stock, $100,000. Promoters: Warner Van Norden, Wm. de la M. Van Norden, New York; H. T. Bronson, Rye, N. Y.; Edw. C. Boardman, Garden City, N. Y.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JUNE 18, 1895.

ELECTRIC RAILROADS AND APPLIANCES.

541,073. Electric-Car Brake. George B. Damon, Lowell, Mass., assignor of one-half to Gardner W. Pearson, same place. Filed April 30, 1894.
541,0 8. Crossing for Trolley-Wires. John Kroger, Pleasantville, N. J. Filed Nov. 3, 1894.
541,126. Trolley-Wheel. Charles Smith, Belleville, N. J., assignor to the Eastwood Wire Manufacturing Company, same place. Filed March 3 , 1894.
541, 65. Electric Railway. Rudolph M. Hunter, Philadelphia, Pa. Original application filed Jan. 12, 1887. Divided and this application filed Sept. 7, 1889.
541,38 . Underground Closed-Conduit System for Electric Railways. Adolph J. Smith, Milwaukee, Wis. Filed June 6, 18 4.

ELECTRIC LIGHTS AND APPLIANCES.

541,1 1. Device for Conducting Electricity to Lamps, etc. George F. Rose, London, England. Filed Feb. 27, 1895.
541,179. Electric-Arc Lamp. Charles A. Pfluger, Chicago, Ill., assignor to the Standard Electric Company, same place. Filed July 2, 1894.
541,290. Arc Lighting. Samuel W. Rushmore, Brooklyn, N. Y. Filed March 20, 1895.

DYNAMO ELECTRIC MACHINERY.

541,357. Compound-Wound Alternating Generator. John D. Hilliard, Jr., Bluefield, W. Va. Filed June 21, 1894.
541,380. Armature for Electric Motors and Generators. James F. McLaughlin, Philadelphia, Pa. Filed Dec. 5, 1891.

BATTERIES, ETC.

541,081. Storage-Battery and Method of Making Same. Nathan H. Edgerton, West Whiteland, Pa. Filed Feb. 27, 1894.
5 1,3 0. Portable Galvanic-Battery Cell. Frank A. Glasgow, St. Louis, Mo. Filed Sept. 18, 1894.

TELEPHONE AND TELEGRAPH APPARATUS.

541,077. Telephone System. William W. Dean, St. Louis, Mo., assignor to the Bell Telephone Company of Missouri, same place. Filed Feb. 21, 1895.
5 1,148. Current-Strength Indicator. Percival G. Burgess, Boston, Mass., assignor to the American Bell Telephone Company, same place. Filed March 25, 1895.
541,149. Transmitter. John Burry, New York, N. Y. Filed Oct. 23, 1893.
541,152. Distributing-Frame for Telephone-Circuit Conductors. Frank B. Cook, Chicago, Ill., assignor to the American Bell Telephone Company, Boston, Mass. Filed Jan. 9, 1895.
541,225. Repeater. Moses G. Crane, Newton, Mass. Filed Aug. 4, 1894.

MISCELLANEOUS.

541,136. Rheostat or Other Circuit-Controller. Charles Willms, Baltimore, Md. Filed Nov. 6, 1894.
541,137. Calcium-Carbide Process. Thomas L. Willson, New York, N. Y. Filed Jan. 16, 1895.
541,146. Electrolytic Process and Apparatus. Henry Blackman, New York, N. Y. Filed July 2, 1 94.
541,147. Process of and Apparatus for Bleaching. Henry Blackman, New York, N. Y. Filed June 28, 1894. Renewed April 27, 1895.
541,1 4. Electric Switch for Railways. Leonard Wheeler, Sioux City, Iowa. Filed June 8, 1894.
541,2 0. Electric Elevator. Rudolf Eickmeyer, Yonkers, N. Y. Filed Oct. 1, 1890.
541,227. Electric Switch. Chimsonovitz P. Elleson, London, England. Filed July 16, 1894.
541,233. System of Electrical Distribution. Charles K. Huguet, New Orleans, La. Filed Jan. 30, 1895.
541,243. Push-Button. Frederick W. Manger, Brooklyn, N. Y., assignor to Huebel & Manger, same place. Filed Oct. 1, 1894.
541,2 7. Electric Stop-Motion for Engines. Eugene C. Myrick and George C. Doeg, Providence, R. I. Filed May 23, 1893.
511,332. Insulator. James M. Patterson, Springtown, Tex. Filed April 10, 1895.
541,341. Electric Alarm Signal and Indicator for Trolley Railroads. Jacques A. Buisson, New Orleans, La. Filed April 2, 1895.
541,399. Electric Train-Signal. Edward J. Devine, Port Arthur, Canada. Filed Dec. 11, 1894.

ELECTRICITY.

VOL. VIII. NEW YORK, JULY 3, 1895. No. 25

ELECTRICITY

Published every Wednesday by the

ELECTRICITY NEWSPAPER CO.

B. E. GREENE, PRES'T. L. J. MONTGOMERY, SEC'Y.

PUBLICATION OFFICE:

6 Park Place - New York

EDITORS: NELSON W. PERRY.
BURTON E. GREENE.
R. H. WILLOUGHBY.

BUSINESS MANAGER, - - JOHN L. GANS.

SUBSCRIPTION RATES:

UNITED STATES, - - - - -	$2.50
IN CLUBS OF FIVE OR MORE, - - - - -	$2.00
FOREIGN COUNTRIES, - - - - - -	$4.50
SINGLE COPIES, - - - - - -	10 CENTS

ADVERTISING RATES:

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.

Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

ENTERED AT THE N. Y. POST OFFICE AS MAIL MATTER OF THE SECOND-CLASS.

TRADE SUPPLIED BY
THE AMERICAN NEWS COMPANY,
THE WESTERN NEWS COMPANY,
And their Agencies in all Principal Cities.

EDITORIAL NOTES.

The Institute Meeting at Niagara. Last week witnessed what in some respects was the most successful meeting thus far in the history of the American Institute of Electrical Engineers. By way of attendance it exceeded by nearly 100 per cent. the largest previous assemblage. The weather was most auspicious throughout the meeting, and the attractions of the Falls themselves added zest and vigor to the expectant visitors. The papers as a whole were not up to the highest standard, and this is one of the two only regretable features of the meeting. While quite a number of the papers were below the high standard of some previous meetings, there were others of such pre-eminent interest as to have fully justified the trip had there been nothing else to round out the programme. There was, however, an event which will go down to history as one of the prominent landmarks, not only in electrical development, but in that broader one of engineering science, and the Institute may count itself fortunate in being present at the first public turning of the Niagara power plant. This event and the technical details as given by Dr. Sellers and Mr. Stillwell overshadowed every other feature, and will long be remembered by those who were so fortunate as to be present. The Institute will be proud too to include Mr. Stillwell's full report in its Transactions, and in this manner to give it permanent form where it may be studied by electricians the world over.

Another feature of the meeting was exceedingly gratifying, viz., that a greater proportion than ever before of the papers were ready in printed form before the meeting. We have always maintained that this should be required as a condition of acceptance of papers, and are glad that our idea was so nearly attained at Niagara.

One of the most significant features was the discussion following Dr. Emery's paper on the cost of steam power. Both the paper and the discussion were pertinent to the occasion, and substantiated most fully the position which we all along have maintained, viz., that it was *extremely* doubtful if the Niagara Power Company could sell power in Buffalo in competition with locally generated steam power. We believe that most engineers are at heart with us in this belief, and this was evidenced by the fact that in the discussion referred to the question was *not* could it compete in Buffalo, but could it compete in Niagara Falls with locally generated steam power. But whatever our views are as to the commercial practicability of the Buffalo-Niagara transmission scheme, that does not deter us from admiring the perfect engineering feat as such, which is now an accomplished fact. No one is more ready than we to praise the skill and engineering talent that have given the world this most perfect example of applied science. As an engineering triumph, and in its boldness, it is almost unique, and those whose names are intimately associated with it will go down to history in a way that will make their descendants justly proud.

* * *

The Independent Telephone Movement. No one could have attended the recent meeting of independent telephone men at Pittsburg without being absolutely convinced of the genuineness of the movement and its strength. This first meeting was a great educator, and we trust the Association formed there will not lose sight of the important fact that its first mission is to spread intelligence. Other objects should be only incidental. But ELECTRICITY sees no reason for preaching to these gentlemen. The conduct of the whole movement has so far been admirable, and is in striking contrast to the somewhat similar attempts to form various associations or combinations among other elements in the electrical trade. During the first session or two the inexperienced listener would have got the notion that any union was impossible. There seemed to be nothing but the expression of entirely discordant views. Yet this was the essential preliminary of ever getting together on one common ground. After every man "had his say" it was found there was one common platform on which every man in the telephone business, outside of the old company, could stand with two solid feet.

There was little argument as to the qualifications for membership, and it was the almost unanimous sense of the members that every man or concern making and selling any particular part of a telephone system should be eligible upon payment of the regular fee. This is as it should be. There are to-day no less than 175 to 200 such concerns, and while they are competitors in business they have several points of interest in common. It is to be hoped that the broad views which have so far characterized the proceedings will continue in practice.

The American Bell Telephone Company is, of course, here to stay, but it is essentially contrary to the spirit of American progress and independence that a field so vast as that of telephony, with all its possibilities, should remain in the hands of any one, ten, or twenty companies.

The field is almost unlimited, and will not be fully cultivated for years to come. It is worthy of all the thought, brain and energy which can be brought to bear upon it, and its full development would be impossible if dependent upon one company.

The imperative first step to insure success is to convince local capitalists that the telephone exchange business is safe, profitable and permanent, and to show to tens and hundreds of business establishments and house-owners that individual telephone outfits are safe to buy and economical in the service performed. It will be ELECTRICITY's pleasure to spread this information.

* * *

The "Engineer's" Blindness, or What?

In our issue of June 12 we made casual reply to an editorial of the *Electrical Engineer* entitled "Buffalo Blindness." The Buffalo *Express* devotes over a column of its editorial page to a review of these "casual" remarks of ours, and concludes as follows: "*Its* (ELECTRICITY's) *contemporary is in duty bound to defend itself, and unless we mistake its temper, that defence will be a vigorous one.*" The Buffalo *Express* evidently doesn't know the *Electrical Engineer* or it would not expect it to do *anything* vigorously. Not even to such a severe arraignment as that which we published can the *Electrical Engineer* reply vigorously. Here is the reply that our contemporary makes: "Since our recent editorial was written on 'Buffalo Blindness,' referring to the unfortunate position in which Buffalo had placed itself with regard to Niagara power, important changes have taken place in the situation, more than justifying the views we then ventured to express, and which *we still venture to hold*, despite the abuse, scorn, contumely and vulgarity heaped upon our devoted heads." Now, isn't that vigorous?

There is an old saying that there are none so blind as those who will not see. It makes no difference that we point out to our contemporary that *none* of the schemes mentioned as living examples of commercially successful transmission of 20 *miles* or *over* are equal to that distance, it "still ventures to hold" that they are. It makes no difference that the records show that at the Frankfort-Lauffen transmission the power cost five times as much when delivered at Frankfort as it could be generated locally for by steam—our contemporary "still ventures to hold" that it was a commercially successful experiment. It makes no difference that we point out that in the 16-mile transmission to the Tomboy mine the delivered power competes with locally generated steam power with coal at $20 per ton, and that we endeavor to show that such a competition is commercially a different problem from that of transmitting 20 miles and competing with steam generated from coal at $1.50 to $2.00 per ton—our contemporary "still ventures to hold" that it is not.

When we ridicule the *Engineer's* idea that $18 per annual H. P. is *low*, that paper considers it *abuse*. When we dismiss the idea that our friend Huntley or the Buffalo General Electric Company could not furnish arc lights at $50 per annum if given the mechanical power *free*, the *Engineer* considers it *scorn*, and it *is* scorn.

When we analyze one by one the *Engineer's* statements upon which it bases its whole argument, and show that they are each wrong, it considers it *contumely*, and it is right. When we refer to the stockjobbing feature of the Niagara land scheme, we are accused of *vulgarity*, and if truth-telling is vulgarity we plead guilty. But our contemporary says that since its editorial was written "important changes have taken place in the situation." Does it refer to the newspaper yarn, to which it innocently gave publicity, that Tesla had discovered a means of transmitting current from Niagara without loss by means of pipes containing a salt solution? No, it does not mean this; it means that some of those most closely interested in the land sale feature are trying to frighten people away from Buffalo by proposing to give Buffalo the go-by and transmit their power *further*—to the embryo town of Depew.

One thing has indeed happened since the editorial in question, and that seems to corroborate quite fully our suggestions of caution in regard to some features of the Buffalo franchise. There has been a meeting of the Power advisory committee of Buffalo, and before this Mr. Rankine, of the Niagara Company, has explained why his company cannot fix a maximum price for power delivered. It is because "We are not going to sell or distribute any power ourselves even to Niagara Falls, but intend to organize and capitalize a company to conduct our business here, and we want authority to transfer our franchise to them."

At last we have a candid confession that should forever set at rest the advisability of every precaution before the city commits itself to a franchise that is to be bandied about to the highest bidder irrespective of his responsibility.

The above reason is given why the Niagara Company will not agree to a stipulation restricting the sale or transfer of the franchise should it get it, but it is certainly also a *very* good reason why the Niagara Company should *not* get it.

We insist upon it that the only *rational* basis on which the city of Buffalo can consider the granting of a franchise is upon a maximum charge for power delivered, and a knowledge that it is dealing with principals. We very much question whether under the conditions of cheap power, labor and supplies which obtain at Buffalo, and the enormous fixed charges which stand in lieu of coal at Niagara, the delivery of power at Buffalo can be made a commercial success. If it can be, the Niagara Company must convince the capitalists who are to undertake the supply of the fact before they will invest. If these capitalists can be convinced that there can be a profit, then they will be willing to name a minimum price which will yield them that profit. The Niagara people have certainly given no figures as yet to the public which show that power can be delivered at a profit. On the contrary, the figures that they have given show just the reverse as far as they show anything at all.

Should the Niagara-Buffalo transmission scheme prove a commercial failure, as we are convinced it will, it will give the business of electrical transmission of power the blackest eye it has ever had. It will give it a set-back from which it will not recover for twenty years. If the scheme is to be a success, then those who have been projecting it these many years must have some figures upon which success can be based. Why don't they publish these figures? Why don't they state what advantages will accrue to Buffalo by the delivery of the power there? Why don't they state what they will give in return for the franchise which they seek? If they require assistance to enable them to sell power at a figure that will be advantageous to Buffalo, why don't they state what assistance they will need, and at what figure they will sell in case they receive such assistance? The city of Cincinnati spent nearly thirty million dollars in a railroad to tap the Southern railroad system because she saw it would be an advantage to do so. Buffalo might well grant a large subsidy if by so doing she could be assured of adequate returns from Niagara power.

Those who ought to know best say they can't state what advantages they can offer. They ask the city of Buffalo to give them an exclusive franchise—for what? Confessedly, that they may sell it to Tom, Dick or Harry—for what? Apparently that the city of Buffalo, if it is to have electric light and power at all, must buy of them, or those whom they shall authorize to furnish it, upon payment of due tribute. To our minds the whole thing looks very fishy. We would like to think otherwise. Let us have figures and FACTS.

Under the Searchlight.

Views and Opinions on Timely Topics.

A Signal Disappointment.

Shrewd Investors Did Not Heed "Electricity's" Warning.

(New York Sun, July 1.)

Next to Cordage, the most signal disappointment to confiding investors has been the General Electric. As recently as April, 1893, the $30,000,000 common stock of this company was paying dividends of two per cent. quarterly and sold at 108, having previous to that time brought 114. The $4,250,000 preferred stock was not to be had, except on rare occasions, it being closely held at over par as an undoubted seven per cent. security by people who could afford to disregard the fluctuations of the market. The company stopped paying dividends in August, 1893. The common stock is now quoted at about 36, and the preferred stock at about 70. When dividends will be resumed nobody ventures to predict. The peculiar feature of the collapse is that, like that of the West Shore Railway ten years or more ago, it caught many of the shrewdest and most experienced operators in the country, besides a vast number of smaller fry, who were allured into buying the stock by the favorable opinion of it expressed by J. Pierpont Morgan, D. O. Mills, T. Jefferson Coolidge, Frederick L. Ames and H. L. Higginson. These gentlemen showed their faith by their purchases, but those who suffered by following their example very unreasonably insist on holding them accountable for their losses. One, even, was driven insane by his misfortune in this respect, and the wailing of others over theirs is, even to this day, unabated.

No Uncertainty Whatever About Our Staying Qualities.

C. E. Lucky, President. J. C. Duncan, General Manager.
F. J. Milligan, Secretary.
PEOPLE'S TELEPHONE AND TELEGRAPH COMPANY,
KNOXVILLE, TENN., June 25, 1895.

To the Editor of ELECTRICITY.

DEAR SIR: Herewith I hand you a check for $2.50. Please send your paper to my address.

I take it on account of its present independent attitude, but how long this will be I assume it is uncertain.

The *Electrical World* is a paper I have taken during the entire time of its publication, but regret to say, as many others, that this and the *Engineer* are supporters, in my opinion, of the Bell Telephone Company.

It does not, however, injure us in any way in our telephone enterprise, as we have the business here and are going to hold it. Yours truly,

J. C. DUNCAN.

* * *

OUR data in regard to the transactions of the Northwest General Electric Company have been finally completed, and we shall present the first installment of the story in our issue of July 17. The series will be interesting and instructive, and we bespeak for it the careful consideration of all those who desire the purification of this trade.

* * *

THERE is no doubt that there is a strong desire on the part of the G. E. management to move from Schenectady. The officers of this company are very like prima donnas and actresses—they thrive on press notices and pine without them, and in no way apparent at present could so much talk be created as by centralizing all the works at—Depew, for instance. The Vanderbilt-Morgan party have invested a couple of millions in land there. If they gave the G. E. a bonus of a million or two, and moved a few other easily controlled establishments there, they could add 15,000 to the population of Depew almost in a night, and quadruple the value of their real estate. We guess Schenectady, Lynn and Cleveland will lose the G. E. Works.

THE TELEPHONE WORLD.

Independent Telephone Men Combine.

THE TELEPHONE PROTECTIVE ASSOCIATION FORMALLY ORGANIZED.

Enthusiasm and Harmony at Pittsburg.

At the sessions of the Telephone Protective Association of America held at Hotel Duquesne, Pittsburg, on the 25th ult., the work of formulating the constitution was completed and officers and directors elected for the ensuing year.

The constitution is a brief document, but it makes no ambiguous statements touching the purpose and objects of the Association. The objects are thus defined: "Mutual protection from unjust legal and other attacks by owners of alleged telephone and cognate patents tending to impair the lawful business of members of this association; to discourage litigation between members of this association by providing methods of arbitration."

All persons and corporations interested in the objects of the Association shall be eligible to membership upon payment of membership fee of $25 and approval of application by the Executive Committee.

The officers of the Association shall consist of a president, first, second, third, fourth and fifth vice-presidents, secretary and treasurer, who with twelve directors shall constitute the Board of Directors, all of whom shall be elected at the annual meeting of the Association.

The duty of the Executive Committee, which consists of the president and the first and second vice-presidents, shall be to manage all legal interests of the Association and provide for the defence of suits against its members and to fill all vacancies in the Board of Directors.

Section 9 defines the course of procedure in defence of suits as follows:

> "Whenever the Association shall receive information of the bringing of a suit for infringement of any telephone patents, it shall at once examine into the case as far as practicable and may call a meeting of the Board of Directors, who shall provide for the means to defray the expenses of such litigation as they shall deem proper under the circumstances.
>
> "The annual dues shall be $25, to be paid on the 1st of July each year. Members in arrears for three months shall not be entitled to any privileges of membership.
>
> "The president may call a meeting of the Board of Directors at any time, and upon the request of any two vice-presidents shall call a meeting to be held at Hotel Duquesne, Pittsburg, within ten days after such request is made. The annual meeting will be held at Niagara Falls September 1."

The following officers were elected:

President—J. E. Keelyn, Western Telephone Construction Company, Chicago.

First Vice-President—J. R. Johnson, Viaduct Manufacturing Company, Baltimore, Md.

Second Vice-President—S. J. Turnbridge, Utica Fire Alarm Telegraph Company, Utica, N. Y.

Third Vice-President—E. S. Wallace, Columbia Telephone Company, New York.

Fourth Vice-President—J. G. Ihmsen, Keystone Telephone Company, Pittsburg.

Fifth Vice-President—Lipman Levy, The Anthony Company, Cincinnati, O.

Secretary—Paul W. Bossart, Minneapolis, Minn.

Treasurer—P. C. Burns, American Electric Telephone Co., Kokomo, Ind.

Directors—Arthur F. Boardman, National Telephone Manufacturing Co., Boston, Mass.; E. A. Katlin, Mason Telephone Co., Richmond, Va.; P. L. Spooner, Standard Telephone and Electric Co., Madison Wis.; E. B. Seeley, E. B. Seeley & Co., Philadelphia, Pa.; Thos. McCubray, Tucker Electrical Construction Co., New York; —— Kuhn, Clamond Telephone Co., Philadelphia, Pa.; Jas. D. Randall, Florida Telephone and Construction Co., Memphis, Tenn.; Frederic Harrington, Union Electric Co., Cleveland, O.

Executive Committee—J. E. Keelyn, Chicago, Ill.; J. R. Johnson, Baltimore, Md.; S. J. Turnbridge, Utica, N. Y.

Four more members, making twelve in all, are to be added to the directors named above. These were selected at the Pittsburg meeting, but were not to be formally added to the list until it can be ascertained whether or not the parties selected desire to serve.

James K. Hammill, of Newark, Ohio, secretary of the Ohio Telephone Exchange Co., was present at the Pittsburg meeting with a proposition for a joint meeting of the Protective Association and the independent telephone exchange companies to be held at some central point some time in July. This idea was given birth at a meeting of the Ohio Telephone Exchange Co., held at Columbus, June 7th, when it was resolved to call a meeting of all the independent companies throughout the United States for the purpose of organizing a National Association. In the formal call issued by President James M. Thomas and Secretary James K. Hammill, the purpose of this association was defined as follows: "To combine the interests of all the independent telephone companies throughout the United States for the betterment of the telephone service, long distance telephone lines, and for the mutual protection of the users of telephones, etc."

Mr. Hammill stated at the Pittsburg meeting that the invitation also included the manufacturers of telephones and telephone appliances, and more, they were asked to make an exhibition of their apparatus at the proposed convention in a suitable hall to be provided for that purpose. In addition, it was requested that the manufacturers contribute $25 each to the National Association for the purpose of defraying the expenses of this meeting.

Mr. Hammill's proposition was duly considered and the conclusion was reached that all the purposes and objects sought by the proposed National Association of exchange companies could best be attained through membership in the Protective Telephone Association. Invitation was therefore extended to all such companies to become members.

NOTES.

The choice of Mr. P. C. Burns, of the American Electric Telephone Company, Kokomo, Ind., as treasurer was a wise one. Mr. Burns is one of the old-timers in telephony, and his election will inspire confidence that in the important matter of finances the Association's interests will be well guarded.

Judge Wallace, now of New York though formerly of Ohio, happened in Pittsburg just in time to be of great service to the other members in formulating a plan of action acceptable to everyone.

Mr. S. S. Stout, who spent thirteen years of his life in the Patent Office, is in a position to give valuable assistance on points of patent law and historical data bearing upon the business.

Mr. J. R. Johnston, of the Viaduct Company, who has undoubtedly given as much thought to the knotty problems connected with the work of the Association as anyone, is an enthusiastic believer in the full success of the plan.

It was a general subject of regret that the National Company of Boston was unable to send a representative, but at the next meeting Mr. Leatherbee can no doubt be counted on to take an active part.

A general popular misapprehension is that this Association and the opposition movement generally is made up of newcomers in the business. This is far from the truth, nearly every man engaged in the movement has been familiar with the business from the beginning. They are not handicapped by lack of knowledge. They know telephony thoroughly both in its technicalities and commercial applications. They know what patent claims are valid and those that are not. They do not propose to be organized trespassers or infringers of good patents. They know that superior telephone service can be given outside of the Bell and allied patents, and have already demonstrated that fact.

A conspicuous feature of the meeting was the absence of abuse or even criticism of the Bell people. The general sentiment was that the past was dead, and every man should turn his face squarely to the future in confidence and security that a wide and fertile field is open.

Mr. J. E. Keelyn is well equipped to supply the Association with good information as to the history of the art, and it is to be regretted that he was not able, for lack of time, at the Country Club dinner, to show, as he intended, prior use of the telephone by the Aztecs.

TELEPHONE PROGRESS IN OHIO.

The independent telephone exchange development in Ohio continues steadily. The Ohio Telephone Exchange Company, that State organization of the new telephone exchange companies, was formed but two months ago, and has already a membership of twenty-five companies located at the following towns and cities in that State: Columbus, Cambridgeboro, Circleville, Lancaster, St. Mary's, Zanesville, Findlay, Delaware, Van Wert, Lima, Wapakonita, Norwalk, Plain City, Fostoria, Tiffin, Upper Sandusky, Bellefontaine, Middletown, Marysville, Mount Vernon, Chillicothe, Newark, Defiance and Mansfield.

Of the above named places the following have exchanges now in actual operation: Findlay, Norwalk, Marysville, Mount Vernon, Chillicothe, Newark and Defiance. At Mansfield the plant is being constructed, and will shortly be ready for operation. The Newark exchange has 300 instruments connected and is giving highly satisfactory service.

President Eckert of the Western Union Telegraph Company denies the statement that his company had fallen out with the Bell Telephone Company and was about to compete with it for long distance telephone business. There was no thought by the Western Union management, he said, of going into an independent telephone business or of buying control of the Bell Company in New York, that is, the Metropolitan Telephone and Telegraph Company.

The board of public affairs at Little Rock, Ark., has reported an ordinance granting a franchise to the Little Rock Telephone Company.

Defense of Hart and McDonald.

United Electric Securities Co. Defeated at New Orleans.

The case of the United Electric Securities Co , asking for the appointment of a receiver for the Louisiana Light Co., came up at New Orleans on June 24.

The main points in the affidavits for plaintiff have already been printed in ELECTRICITY.

Excepting the affidavit of M. J. Hart, which is almost identical with that of Mr. R. T. McDonald, the following are the chief affidavits offered in reply:

Mr. McDonald's testimony was to the effect that the Louisiana Electric Light Company was organized in 1889, and succeeded the corporation known as the Louisiana Electric Light and Power Company. The organization was brought about by the Fort Wayne Electric Company. The Louisiana Electric Light and Power Company had become involved in debt beyond its means to pay its liabilities, amounting to between $325,000 and $400,000, a large part of which it owed to the Fort Wayne Company. There was a general understanding that the corporation should be reorganized with a capital stock of $500,000, and that $700,000 in bonds should be issued on the same. The debts of the old corporation were to be assumed and paid. The stockholders, at their option, were to be given stock in the new company, upon which dividends of 6 per cent. were to be guaranteed by the Fort Wayne Company. All property rights of the old company were to be transferred by the instrumentality of liquidators to the new company, and the Fort Wayne corporation was to take $425,000 of the stock to be issued and a sufficient number of bonds at 90 cents on the dollar to pay the debts of the said old company, and should afterwards, from time to time, take the remainder of the said bonds at the same price, as the money should be needed for the extension of the plant and the equipments, except those which should be taken by the stockholders of the old company in exchange for their stock, and convey to said new company the exclusive right to the use of electrical inventions covered by the patents owned by the Fort Wayne Company in New Orleans, which agreement was carried out by the incorporation of the Louisiana Electric Light Company and the issue and delivery of the stock and bonds according to the understanding aforesaid. It was pursuant to this arrangement that the $425,000 of the stock of the Louisiana Electric Light Company was issued to the Fort Wayne Company; $54,000 was issued to the stockholders of the Louisiana Electric Light and Power Company and the remainder, $21,000, still remains unissued. Of the bonds, approximately —— were taken under the arrangement by the stockholders of the said company and the remainder were taken under the same arrangement by the Fort Wayne Company. At this time half of the $425,000 of stock was turned over to the Thomson-Houston Company in the course of business dealings. The same stock subsequently passed into the hands of the United Electric Securities Company, of Portland, Me. *Affiant believes the Thomson-Houston Company owns nearly all the stock in the United Electric Securities Company.* The delivery from the said Fort Wayne Company was with the understanding that the stock was not to be transferred upon the books of the company, but should continue to stand in the name of the Fort Wayne Company.

The organization of the Louisiana Electric Light Company was promoted by the Fort Wayne Company for the purpose of securing the large debt due it by the Electric Light and Power Company, and continuing in the city of New Orleans a company which would be able to carry on the electric light and power business. These arrangements were all carried out in full; the debts of the company were paid, and the stockholders who presented their stock for exchange received therefor either stock or bonds as had been agreed. There has been no issue since except to the New Orleans Traction Company, and it was fully aware of the conditions under which the issue was made.

The United Securities Company knew that the stock issued to them was a part of the $425,000 and that it had been issued for patents and considerations aforesaid.

At that time the Thomson-Houston Company owned a controlling interest in the Fort Wayne Company and the transaction by which the Fort Wayne Company reorganized the old Louisiana Electric Light and Power Company was approved by the said Thomson-Houston Company. *If it was illegal, the stock complainant owns is a part of it, and is likewise illegal, and gives him no right as a stockholder in the Louisiana Electric Light Company.*

Concerning the tower company, Mr. McDonald's testimony shows that Mr. M. J. Hart secured a franchise from the city in 1887 to erect iron towers upon which the wires were to be strung. When the Louisiana Electric Light and Power Company was organized, it was understood that the towers and tower business was to be transferred to it. The work of constructing the towers was carried on by the Star Iron Tower Company, of Indiana, a corporation owned and controlled by the Fort Wayne Electric Company, and largely with money advanced by the Fort Wayne Company. The costs of the foundations, etc., were paid by M. J. Hart. All this was done with the understanding that the business was to be turned over to the Louisiana Electric Light Company as soon as it was in condition to pay the money advanced. The understanding was consummated in 1894, when the Louisiana Electric Light Company agreed to take an assignment of $480,000 par value of the stock of the New Orleans Tower Company, the whole authorized capital of the tower company being $500,000, and to pay the claim of the Star Iron Tower Company for twenty towers, amounting to $103,900, to pay affiant $25,000 and M. J. Hart $26,100 for money advanced in foundations and other expenses. On account of the agitation then going on to remove the electric wires from the street it seemed feasible and practicable to put them on towers, as conduits for underground wires were difficult to put in on account of the water in the soil under the city.

With reference to the $50,000 voted to the Fort Wayne Company by the directory of the Louisiana Electric Light and Power Company, Mr. McDonald testifies that the Edison Electric Company, of New York, was a creditor and had brought suit against the Louisiana Electric Light Company for patents, all of which promised to be disastrous. The Edison Electric Illuminating Company, of New Orleans, had the exclusive right to the use of the incandescent lights, and to prevent disastrous litigation the Edison Company, of New Orleans, was purchased by the Fort Wayne Company, the sum of $363,000 being expended in cash; $65,000 of outstanding debenture bonds were assumed, and a floating debt of $20,000 also assumed in the purchase. As the Edison Company could have closed up the Louisiana Light Company and stopped its incandescent business, the Fort Wayne Company was actuated to make the purchase aforesaid. The sum of $50,000 paid to the Fort Wayne Company was a small amount, as $150,000 was demanded by the stockholders of the Fort Wayne Company, they feeling that even this sum was no more than should be paid on account of the benefits accruing to the Louisiana Company from the purchase of the Edison Company.

In purchasing the Edison Company's stock it was the intention that the Louisiana Light Company should acquire the same. It agreed to take the $200,000 of the stock of the Edison Company. The United Electric Securities Company afterwards purchased $200,000 of the bonds of the Edison Company. Fifty thousand dollars of said bonds were afterwards sold by the Fort Wayne Company to the Thomson-Houston Company, and by them to the United Electric Securities Company.

Affiant says that there has never been a time when the Louisiana Company has not been indebted to the Fort Wayne Company. Its plant has been maintained and value imparted to its securities by the Fort Wayne Company. Affiant has considered the interests of the two companies identical; that the only way the Louisiana Company could prosper and keep up its plant was to increase its business, and the only way the Fort Wayne Company could protect its large interests at stake in the Louisiana Company was to render it such support as would enable it to protect its credit and meet the conditions of successful business. During the panic of 1893 the affiant carried the Louisiana Company along by his individual exertions, pledging his personal credit to the sum of $400,000.

With the exception of the contract with the traction company, the Louisiana Light Company has met the expectations of the directors.

Concerning the charges in the bill of complaint that the affairs of the company have been conducted unlawfully, and that there has been a maladministration of the same, the affiant declares that he has managed its concerns to the best of his ability, and that he has given time and labor to promote its interests without receiving a cent of compensation, all his traveling expenses, etc., being paid by the Fort Wayne Company.

Oscar T. Crosby, an electrical expert and former manager of the Edison Company, testified as to the machinery of the Louisiana Company. He avers that the towers were durable and strong, and capable of being used to great advantage for stringing wires, and also gave evidence of the profits of the electrical business with the percentages charged for the use of patents by different concerns and other technical matters relative to the conduct of a plant like the one operated by the Louisiana Electric Light Company.

The affidavit of C. A. Coffin, of the General Electric Company, was read, wherein it was set forth that the issue of $425,000 of stock to the Fort Wayne Company was not paid in cash, but in patent rights and for other considerations. They have a real, but not a fixed value. The $50,000 paid by the Louisiana Company to the Fort Wayne corporation for purchasing the Edison stock and saving the Louisiana Company from law suits on the use of incandescent lights was a small immunity, in consideration of the value of the purchase to the business of the Louisiana Company. The iron towers, he declares, would be of great value to the light company in case they should have to remove their wires from the streets, as from the character of the soil in New Orleans he knows that the establishment of conduits would be impracticable.

THE PETITION DENIED.

On June 28 the petition of the United Electric Securities Company and the New Orleans Traction Company for the appointment of a receiver for the Louisiana Electric Light Company was denied by Judge Pardee.

He ordered, however, that the affairs be conducted in statu quo by the present officers, under the supervision and control of the Court, until the annual election for directors in February, 1896.

R. T. McDonald vs. Receiver Grant.

Mr. R. T. McDonald has won in the action he brought against Hugh J. Grant, receiver of the St. Nicholas Bank, to recover certain bonds of the Louisiana Electric Light Company given originally as collateral for a loan from the Madison Square Bank.

In 1893 the Madison Square Bank gave its note to the St. Nicholas Bank, and as collateral one of McDonald's notes for $50,000, and certain bonds of the Louisiana Electric Light Company. When the St. Nicholas Bank failed, McDonald tendered the amount of his note with interest, and asked for the surrender of the bonds. Receiver Grant declined.

The Madison Square Bank, which had also failed, put in a claim to the bonds held by the St. Nicholas Bank, claiming its right to hold them until the entire indebtedness of the three notes was disposed of.

Justice Stover disposes of Receiver Grant's contention with the brief comment that the unsoundness of his argument that he can hold the bonds as collateral for other indebtedness needs no discussion.

The Accumulator Company Wound Up.

The affairs of the Electrical Accumulator Company have been wound up by a master's sale authorized by the Court. The principal assets of the company were 321,117 shares of the Electric Dynamic Company's stock and 18,000 shares of stock of the Electric Storage Battery Company. The Electric Dynamic stock, with a claim of $270,000 against the company, brought $125. Nine hundred shares of Electric Storage Battery stock brought $27.50 a share and the remainder $24 a share.

Personal.

Mr. Henry Sachs (Kaliske) has resigned his position as general manager of the Beacon Vacuum Pump and Electrical Company of Boston. For the present Mr. Sachs's address is 21 Harcourt street. All those who have had the pleasure of doing business with this gentleman since his entry into the electrical field will hope to see him again engaged in active business in this trade.

Max A. Berg, secretary of the Wallace Electric Company, has resigned his position as an officer of that company to take effect July 1. Mr. Berg will take a brief rest, and no doubt will become associated with the electrical industries again in the near future.

A. I. E. E.

TWELFTH GENERAL MEETING.

A Large Attendance at Niagara Falls—The Great Power Plant and Fine Weather Unite to Make This a Memorable Meeting—A Relic of the Past.

[STAFF REPORT OF ELECTRICITY.]

Too often has the pessimistic mind had seeming justification in claiming that the elements, the times and all of those other uncertain factors which go to make up the algebra of human affairs have conspired against the fulfilment of the "best laid schemes o' mice and men," but once in a while the conspiracy seems to be turned against the pessimist and "all nature smiles," and with it the optimist. Such was the case at the Niagara meeting of the Institute, which was held during June 25, 26, 27 and 28.

The one event which by reason of its supreme interest threw all others in the shade was the opening for the first time to public gaze of the great Niagara power plant—the fruition of the best thought and labor, of the best engineering talent of two continents, for going on six years of time. The Institute was fortunate indeed in the opportunity which was afforded to witness the first public exhibition of the turning of the great turbine, shaft and dynamo, which bids fair to mark an epoch in commercial electrical development of equal importance to that of the Frankfort-Lauffen transmission from an experimental aspect.

It was a substantial compliment to the Institute also that the Niagara Power Company should extend this invitation to the first dress rehearsal to that body of men who more than any others are interested in the grand achievement in preparation for which they had been so long engaged. This was indeed the principal loadstone which attracted the crowd to the Falls. The Falls themselves, always attractive and entrancing, were of secondary interest to the professional men on this occasion, for they came not to see this mighty power mocking at man's impotency, but to see the most conspicuous example in all history of the triumph of mind over matter.

To those less scientifically inclined the Falls themselves, the Gorge and the mighty Whirlpool and rapids were a sufficient incentive to take the trip, and when added to these kind Providence also vouchsafed weather that was faultless and superb, the conditions for a successful meeting were all but complete.

Reduced rates on all railroads centering at Buffalo or Niagara and a reduction in the usual hotel schedules had been arranged for, and the combination of the unusual attractions at the Falls and a reduction in the expense usually attending the trip brought out by far the largest attendance that has ever been attained at an Institute meeting. The attendance last year at the Philadelphia meeting reached the at that time high-water mark of 125. At Niagara there were 202 registered on the books of the secretary. In addition to these there were many others who did not register—doubtless enough to bring the attendance up to 250.

The headquarters of the Institute were at the Cataract House—a hostelry well known to old visitors at the Falls—and it was in the large parlor of this hotel that the sessions were held. The arrangements were in general excellent, but there was one miscarriage that marred the aspect of an otherwise perfectly appointed affair. It had been announced in all the electrical papers, on the authority of the special committee of arrangements, that the rates at this hotel had been reduced for the occasion to $3 per day. When the bills came to be paid the charge was $3.50 per day. It seems that a loophole was left in the contract with the hotel of which the proprietors availed themselves to the fullest extent. The agreement was that the rates should be $3.50 per day for three days or $3 for four days—the committee assuming that the time referred to length of the meeting and that those attending for a less period would have the benefit of the reduction. The majority of those attending arrived in time for breakfast on Tuesday and left before dinner on Friday, making three and a half days. The hotel proprietors claimed that the $3 per day rate only included those who stayed four days, and therefore charged those who stayed three and one-half days the $3.50 rate. Figuring this up, bills were presented for $12.25, so that those who did not scrutinize their bills closely paid 25 cents more for three and one-half days than they would have been required to pay had they taken another meal and remained another night.

This practice on the part of the proprietors of the Cataract House reminds one of the days we supposed were past and gone, viz., when everyone who went to Niagara expected to be cheated and came away without being disappointed. It seems that the committee of arrangements relied too much on the honor of those with whom they had to deal. In the future the contract should be made so explicit as to be incapable of evasion. This incident, regrettable as it was, may serve a useful purpose, however, in leading others either to avoid business transactions with those who need watching or else to leave no loophole by which they may ultimately be the losers.

Opening Session.

The opening session was called to order a little after 10 o'clock on Tuesday morning by Dr. Louis Duncan of Baltimore, the newly elected president of the Institute, who after a few preliminary remarks introduced the Mayor of Niagara Falls. The latter in a brief address welcomed the members and guests of the Institute to the "Electric City," as Niagara Falls now calls herself.

The first paper on the programme was one by Walter E. Harrington, of Camden, N. J., on "Properties of Fuse Metals When Subjected to Short Circuits."

This paper elicited considerable discussion, the general purport of which was to show that the treatment of the subject had little practical value because of the omission in the consideration of many factors which might have a controlling influence in practical use. The final conclusion at which the author arrived, "that fuse metals are under no circumstances to be considered in the light or nature of a protection," was vigorously attacked, and it was quite apparent that the author did not have the sympathy of his audience.

Mr. Harrington had gathered together the results of numerous tests on fuse wires of different materials and capacities, and from these constructed an equation which he believed was expressive of a law. One of his critics pointed out that this supposed new law was simply Ohm's law, and that since it did not involve the element of time (an essential in the discussion of all problems involving the generation and dissipation of heat in conductors) it was of no assistance or value.

Mr. Steinmetz followed with a paper on the "Theory of the General Alternating Current Transformer." This was a general statement of the alternating transformer in which was included the static transformer, viz., that form in which the primary and secondary are stationary with regard to each other, and the alternating current motor and dynamo in which the two are movable with regard to each other. Considering these different machines as but variations of a type, he showed how their functions depended upon the ratio $\frac{\text{secondary}}{\text{primary}}$ frequency, or slip.

Representing this by k and the primary frequency of E. M. F. by N, then the secondary frequency would be k N. viz., the E. M. F. induced per secondary turn by the mutual flux would have to the E. M. F. induced per primary turn the ratio k.

Where $k = 0$ it meant a synchronous motion of the secondary.

Where $k < 0$ there was motion above synchronism, viz., the secondary driven by mechanical power.

$k = 1$ represented standstill.

$k > 1$ represented backward motion of the secondary, viz., motion against the mechanical force acting between primary and secondary (thus representing driving by external mechanical power).

A general equation for alternating transformers was ennunciated, and it was shown how by simply assigning different relative values to the various terms involved it became the equation for the alternating current stationary transformer, the alternating current motor or the alternating current generator.

The last paper of the morning session was read by Clarence E. Gifford, of Jamestown, N. Y., on a method of "Location of Grounds in Armatures, Fields, etc."

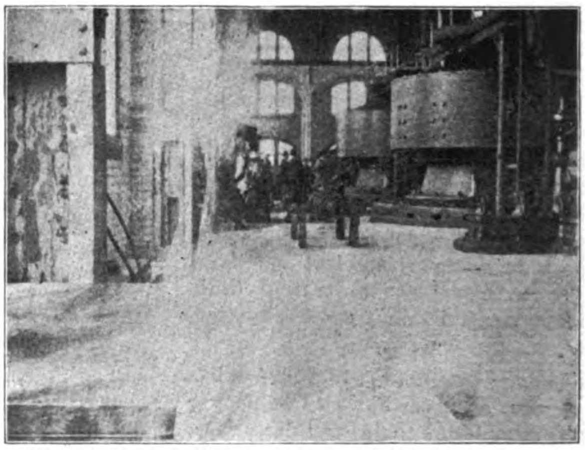
This described a very simple method of detecting grounds, preferably by means of the telephone, or where the noise will not permit of this by means of a dead-beat reflecting galvanometer, a milli-voltmeter or some other form of delicate and rapid working visual indicator, the principle involved being in reality that of the Wheatstone bridge—the two paths around the windings of the armature, if that be the part tested, constituting the bridge. The method is applicable to the detection of a single ground or of more than one either in armature or field. The details of this simple method do not permit of abstracting, and the paper will, therefore, be given in full in a later issue.

Tuesday Afternoon.

Tuesday afternoon had been set aside for the great event of the meeting, viz., a visit to and inspection of the great Niagara power plant and the other developments accessory to the same. Arrangements had been made for carriages at reduced rates, and at about half past 2 o'clock the members and invited guests started on the drive. These works are located about a mile and a half up the river from the crest of the Falls, upon an artificial canal or sluiceway. This latter taps the river above the Rapids and brings the water to the wheelpits over which the power house is erected. It is 1,700 feet in length, 250 feet wide at its junction with the river and has an average depth of 12 feet.

In the old hydraulic plant, which has been in existence since 1861, the water of the river above the Rapids is carried in an open canal 4,400 feet long to a basin near the edge of the cliffs below the Falls, and from this basin the water was drawn for the various mills situated along these cliffs, the necessary fall being obtained most cheaply by carrying the water in pipes down to the wheels located part way down the cliffs, and the waste water was discharged directly into the river from below these wheels. In the present instance, however, it was necessary, should the power house be located at its present position, to create an available fall at this point and to provide a tail-race by which the water, after it had passed the wheels, could be discharged into the river below the Falls. For this purpose a tunnel was started near mean low water mark in the face of the cliff just below the new suspension bridge.

THE NIAGARA POWER HOUSE.



SNAP SHOT OF DYNAMO IN MOTION.

This tunnel extends in a direct line to the wheelpits under the power house, a distance of 7 000 feet. The section of the tunnel is very much that of a horseshoe, having a maximum height of 21 feet and a maximum width of 18 feet 10 inches. The area of a cross section is 386 square feet, and with a fall of 6 feet in 1,000 feet will give the water a maximum velocity of 26½ feet per second, or a little less than 20 miles an hour. The tunnel is lined throughout with brick, that used in the invert or floor being vitrified in order to better withstand the scouring action of the swift current.

To give an idea of the magnitude of this undertaking, it may be stated that over 1,000 men were engaged for more than three years in the construction of this tunnel, which called for the removal of more than 600,000 tons of rock and the use of more than 16,000,000 bricks for lining; 19,000,000 feet of timber, 60,000 cubic yards of stone, 55,000 barrels Portland and 12,000 barrels natural cement, and 26,000 cubic yards sand were used in construction. While these figures are small compared with those that pertain to dozens of our longer railroad tunnels, this is by far the largest undertaking ever attempted for purely power purposes.

At the point directly beneath the power house the vertical distance between the level of the canal and the tunnel level is 178 feet. A vertical shaft or slot of this depth was dug here, and the turbines which drive the great dynamos are located near the bottom. The water is carried from the canal to the wheels in steel pipes 7½ feet in diameter. The wheels, which are turbines, are vertical, 5 feet in diameter, made of bronze, and each capable of delivering to the shaft 5,000 H. P. They were designed by Faesch & Piccard, of Geneva, but built by the I. P. Morris Co. (Cramps) of Philadelphia. They are of the Fourneyron type, each unit consisting of two wheels, the upper one being inverted and the water discharging from the penstock between the two. By this arrangement the downward pressure on the lower wheel is counterbalanced by the upward pressure on the upper wheel. The weight on the steps or bearing of the water column, 136 feet high, is therefore obliterated.

These wheels will each discharge 430 cubic feet of water per second, and with a pressure of 136 feet of fall and making 250 revolutions per minute will, with an efficiency of 75 per cent., give 5,000 H. P.

The guide of each wheel has 36 buckets and the wheel itself 32.

When it is understood that previous to the designing of these wheels the largest turbine ever constructed had less than about 1-6th the capacity of these, it will be realized how bold an undertaking it was on the part of the designers to guarantee the performance under very unusual conditions of such an enormously greater structure.

Further than this, it was necessary that the shaft be carried to the surface, where it was originally intended that it should carry an enormous fly-wheel for the facility of better governing of speed. Both the weight of the shaft and the fly-wheel had to be provided for. In order that the shaft might be sufficiently rigid to withstand the torque required to deliver 5,000 H. P. at a speed of 250 revolutions and at the same time be as light as possible, it has been made in the form of a tube of sheet steel, 3-8th inch in thickness and 38 inches in diameter, except at points where it passes the journal bearings or guides, where it is 11 inches in diameter and solid.

Still the weight is enormous, and if not provided for, the friction due to this weight of the shaft on its lower step or bearing would be sufficient, if not to actually melt it down, to cause a great deal of trouble. The upward pressure of the water against the turbines, therefore, was made to bear this weight, so that the shaft and the weight which it bears on top are practically supported by the column of water which also transmits to it its power.

One of the most difficult of all feats of accomplishment with water wheels is proper governing of speed where the load varies rapidly between wide limits, as it is particularly apt to do in electrical transmissions for certain purposes. The specifications for these wheels required that a governor should be provided that in connection with the fly-wheel would keep the speed constant within two per cent. under ordinary conditions of operation, and not to allow it to vary more than four per cent. should the work done be suddenly increased or diminished by 25 per cent. The governing mechanism was also designed by Faesch & Piccard, and how well it answers the requirements is shown by a test made a few days before the meeting, when at 250 revolutions and an output of 5,300 H. P., 3,000 H. P. was suddenly thrown off entirely. The result was an increase of only 18 revolutions, or only about 7 per cent., with a change of load amounting to over 56 per cent.

These wheels were installed under the personal supervision of Mr. R. Baumann, the official representative of the designers, Faesch & Piccard, of Geneva, Mr. Clemens Herschel, formerly of Holyoke, being the general hydraulic engineer.

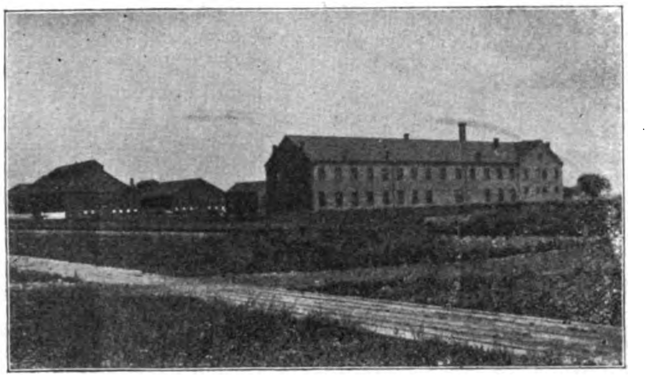
It has been stated that it was originally intended to place a fly-wheel upon the upper end of the shaft. Prof. Forbes, however, designed a type of generator in which the revolving part, which in this case is the fields, constitutes the fly-wheel.

All of the electrical and controlling mechanisms are in the power house, above ground. This handsome building, a view of which, taken by our artist on the day it was opened to the members of the Institute, is presented, was built, after designs by Messrs. McKim, Mead & White, by the contracting firm of James Stewart & Co., of St. Louis and Buffalo. It is a very ornate building of massive limestone without, and for a height of six feet from the floor lined inside with enameled brick. Above this, the interior is lined with ordinary brick coated with white enamel paint. Within this building, lighted by windows on three sides, the engineers were ushered to witness the first public test of this stupendous feat of combined mechanical, electrical and hydraulic engineering, a feat which in magnitude was beyond all precedent, and which for this reason put the very science of engineering to the test. Probably no more appreciative or critical audience of equal size could have been gathered in any part of the world. There were those present who would have detected the slightest flaw in the mechanical construction; there were others to whom any miscalculation in regard to the hydraulic part would at once have been apparent, and still others who would have criticised the electrical features had they been in anyway out of tune; but the moving structure itself would have been its own severest critic, for had any detail been out of harmony with the whole, whether it were mechanical, electrical or hydraulic, there would have been discord.

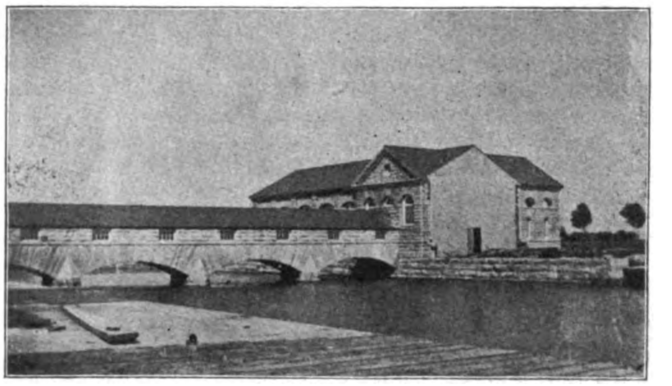
With the full knowledge of the difficulties of the task which the engineers had been severally and collectively called upon to solve, knowing full well the enormous size of the units involved, the mind instinctively prepared itself for some ocular and audible manifestation commensurate therewith. The noise of a boiler shop would not be out of proportion to the magnitude of the power that we knew was being generated. The puffing of a dozen locomotives would have indicated to the lay mind more nearly the exertion that a single unit was capable of putting forth; but it is not the labored poem or the halting delivery that result from finished art. Outward manifestations of power are manifestations of weakness, manifestations of ill-directed effort —of wasted energy. We saw there none of this. Though we saw there a mass of metal weighing 80,000 lbs. revolving at a rate of 250 revolutions, at a peripheral speed of 9,300 feet per minute, producing a fly-wheel effect of 1,274,000,000, the only sound heard was the siren of the turbines 140 feet below. Not a tremor was felt, and it was difficult to realize that that smoothly spinning top whose hum only was heard was at that very time operating a water rheostat load of 1,500 K. W., or a load equal to the rated capacity of the great Intramural railway generator at the World's Fair—the largest generator constructed in this country up to that time.

Our artist took a snap shot of the generator in motion, which is herewith reproduced. It is probable that this is the first picture ever presented of this most interesting event.

As shown in the engraving, there are two of the generators already erected. The one in the foreground has not yet been put up to speed, and was not shown in operation during the meeting of the Institute. The machine in the distance, somewhat dim in outline, is the one that was shown in action, and at the time the shutter was sprung was revolving at its full, all but noiseless speed, and carrying a load equivalent to 50,000 sixteen candle power lamps, for at the time of exposure a load of 5,800 electrical H. P. was put upon the machine.



PITTSBURG REDUCTION COMPANY'S WORKS.



BRIDGE AND TRANSFORMER HOUSE.

In the center of the power house is a large raised platform 57 feet 10 inches long, 18 feet wide and a little less than 8 feet high. Upon this were placed the controlling instruments. At the time of the visit of the engineers the instruments in use were merely temporary expedients, but one of the switchboards was in place though not connected up. We are so apt to associate large and complicated switchboards with large power installations that the mind involuntarily pictures to itself something enormous in this line in connection with the Niagara power plant. It was doomed to the same disappointment in this respect as it was in the outward manifestation of power in the dynamo, for the switchboard is simplicity itself. There are but four levers visible, viz., two main switches, one field-circuit breaker and one field switch. There is also a rheostat wheel by which the rheostats in the field circuits are controlled.

These switches are controlled by levers which actuate the switches proper below the platform by means of pneumatic devices working at a pressure of 125 lbs. per square inch.

The measuring instruments proper are an indicating wattmeter, an ammeter and a voltmeter for each of the two circuits coming from the generator. This is the switchboard by which 5,000 H. P. are controlled and measured, and an additional one for each additional generator put into position will constitute the equipment of the entire plant.

In order first that there need be little loss of energy in the switchboard appliances, and second that there need be no danger from shock, the currents actually handled form but a small proportion of those coming from the generator. Thus the voltage, which at the terminals of the generator is intended to be 2,000, is reduced by transformers to $\frac{1}{20}$ of this before it goes to the switchboard, and the current is in like manner reduced to $\frac{1}{20}$ of its value on the line. The amount of energy actually handled on the platform is therefore but $\frac{1}{400}$ of that generated, and the pressure will normally scarcely exceed 100 volts. It is estimated that at full load the energy lost in this way will not exceed as a maximum 50 watts or $\frac{1}{15}$ of a horse power in an output of 5,000 or over.

The size of each switchboard is 30 inches in width by 45 inches in height. The instruments above referred to, including the indicating wattmeter and voltmeter and the integrating wattmeters used in connection with the feeder circuits (these latter not located on the switchboard platform), are all new and designed especially for this installation by Mr. Oliver B. Shallenberger, consulting electrician of the Westinghouse Company. They are guaranteed to be accurate within 1 per cent.

In the southeast corner of the power house is located the water-rheostat, by which the load on the generator was varied for testing and exhibition purposes. At the far end of the switching platform, but on the floor, is located one of the two rotary transformers by which the alternating currents generated by the dynamo, after having been reduced in potential by static transformers, are to be rectified for the excitation of the fields. At present this is not in use, a direct current from a 75 K. W. direct-current generator, located about 200 yards from the power house, being used for this purpose temporarily.

At the near end of the building is a small electric elevator by which a few of the visitors—three at a time—descended into the depths of the wheelpits. To most of those who undertook the trip it was a most novel experience, but to those who in the past have been familiar with mines it simply recalled old experiences. It was an interesting experience however, though wet, for it gave a better idea of the hydraulic system than could otherwise be obtained. Your correspondent made the descent on two different days, and on one occasion attempted to obtain a photograph, but the dim light of the electric lamps, though sufficient to disclose to the eye the magnitude of the abyss, was insufficient to make an impression upon the sensitive plate.

From one corner of the power house, carried on stone arches across the canal, is a long, narrow gallery connecting it with the transformer house on the further side. An exterior view, given herewith, shows this bridge and the transformer house beautifully. Another view shows the interior of the gallery with the supports upon which will rest the various cables coming from the power house to the transformers. Still another view shows the interior of the transformer house. This latter is entirely empty at present, but it is here that the static transformers will be located by which the current for distant transmission will be raised to the proper voltage. All of these views were taken especially for ELECTRICITY on the occasion of the visit of the members of the Institute to the power house.

After the tour of inspection, of which the above is but a too brief and inadequate account, the visitors re-entered their carriages and by special invitation visited the new works of the Pittsburg Reduction Company, the Carborundum Company and the newly erected Niagara Paper Mill. These three buildings are located about 2,000 feet away from the power house and are the first customers of the Niagara Power Company. The paper mill is already in full operation, has constructed a wheelpit of its own, and draws its water independently from the Niagara River. It delivers its waste water, however, into the Niagara Power Company's tunnel by means of a branch tail-race 7 feet in diameter. It becomes a customer by purchasing the right to use the tunnel as a tail-race for its wheels, and is the first to get into practical operation.

Not far distant from this are the buildings of the Pittsburg Reduction Company and the Carborundum Company, which have contracted for electrical power. The two buildings are shown as they appeared on the day of the Institute's visit—the farther building being that of the Pittsburg Reduction Company. This latter company, which will be the first to start, has contracted for 2,000 H. P. The static transformers for the reduction of the voltage and the rotary transformers for rectifying it for electrolytic purposes are all installed, and everything appears in readiness to start the moment the Niagara Power Company turns the current on. The visitors were admitted into the converter room, but the remainder of the building was closed. In the converter room there are 8 static transformers of 200 K. W. each, which receive the primary currents of 2,000 volts by means of cables connecting them with the power station and carried in underground conduits, and transform them down to equivalent currents at 115 volts. These transformed currents are then led to 4 large rotary transformers which convert them into direct currents and raise their voltage again to 160 volts—the pressure required for the production of aluminum by the Hall process. There are also two large Sturtevant blowers operated by direct current motors—the whole equipment being made by the General Electric Company.

The Carborundum Company's building, shown on the right in the engraving, was not open for inspection, and it is stated that the machinery is not yet in place. This company has made a contract with the Power Company for 1,000 H. P., which it is intended to increase from time to time as the growing business demands.

All three of these establishments are built upon land leased from the Power Company or one of its co-ordinate organizations. In order to afford facilities for the great industrial city which this company hopes to build up around its power house, it has acquired. under one name or another, some 1,500 acres of land chiefly along the river front, which it proposes to lease as mill sites to future customers. As a further facility, it has constructed a railroad, called the Niagara Junction Railway Company, by which the establishments leasing mill sites will be placed in ready rail communication with all the trunk lines coming into Niagara Falls. Nor have the operatives been forgotten. On a part of this property comprising 84 acres the company has erected a model industrial village yclept *Echota*, which has been beautifully laid out into streets, supplied with electric cars and electric lights and water to each house. Houses for about 50 families have already been erected, and many of these are already occupied. The rents of these vary according to size from $9 to $30 per month, including electric light and water. In addition to these, there is a hotel and some stores, and the city of Niagara Falls has erected a handsome and commodious two story and a half brick school house. This village was inspected by those of the members who chose, and then carriages were taken for the Cataract House, where dinner was eaten preparatory to the evening session.

The accompanying map shows, by means of shaded areas, the tracts of land acquired by the Niagara Power and allied companies, and also their relative locations with regard to the city. The old hydraulic canal, which has so long done service, is also shown, together with the property owned by the Niagara Hydraulic Company along the cliffs of the lower river.

TUESDAY EVENING SESSION.

The feature of the evening session was the inaugural address by the newly elected president of the Institute, Dr. Louis Duncan, of Johns Hopkins University, Baltimore. He took as his theme "The Substitution of Electricity for Steam in Railway Practice." He was greeted by a large and appreciative audience of both ladies and gentlemen. An abstract of his address will be found elsewhere in this paper.

The session closed with the reading of a paper by Elihu Thomson on "Compounding Dynamos by Armature Reaction," which will also be printed in full and therefore requires no comment here.

WEDNESDAY MORNING SESSION.

"Electric Power in Factories," by Dr. Francis B. Crocker and Messrs. Benedikt and Ormsbee, of New York, was the very appropriate title of the paper which opened the second day's proceedings. This was followed by one by Mr. Steinmetz, on "Some Features of Alternating Current Systems," which was a non-mathematical discussion of the relations between the various polyphase systems and the so-called monocyclic, the apparent aim of the paper being to show that the so called monocyclic system is not a polyphase system.

The last paper of this session was one by Profs. Dugald C. Jackson and S. B. Fortenbaugh of Madison, Wis., on "Some Observations on a Direct Connected 300 K. W. Monocycle Alternator."

This elicited some criticism, chiefly as regards the sufficiency of the data presented.

WEDNESDAY AFTERNOON.

For the afternoon arrangements had been made for an excursion down the river to Queenston and up to Chippewa, on the Niagara Falls Park and River Electric Railway. Two trains of two cars each were placed at the disposal of the visitors, and a most enjoyable trip was taken to the most important places of interest, including the Cantilever and Railway suspension bridges, the Whirlpool Rapids and the Whirlpool itself, Brock's Monument and the historic ground of Queenston, Ont., below the Falls, and the Horseshoe Falls, Dufferin Islands and Chippewa, above.

The double tracked railway runs all the way along the edge of the cliffs below the Falls and afforded an admirable birdseye view of the lower river. It was a trip which all enjoyed and one well worthy of the time required to make it.

WEDNESDAY EVENING SESSION.

The first paper of the evening was one by Dr. C. E. Emery, of New York, on "The Cost of Steam Power—II." It will be remembered that in 18 8 this gentleman gave the Institute a most elaborate paper on the same subject which has since been quoted by nearly every writer who required statistics on the cost of steam power. In the earlier paper the author considered the cost of power generated under various conditions in 500 H. P. units.

With the approaching completion of the Niagara power plant, with its enormous units of 5,000 H. P., there has been a popular demand for an estimate of the cost of steam power on a similar scale by which comparisons between the costs of water and steam power on this scale might be made. It was to meet this demand that Dr. Emery prepared this paper, showing the cost of steam power on a basis of generating 20,000 H. P. He considered the cost under various conditions with the following results:

20,000 H. P. operated continuously every hour in the year, based on a consumption of 1.25 lbs. coal per indicated H. P. hour; cost of coal $2.24 per ton; engine efficiency assumed at 92.3 per cent.	$27.84
Allowing 5 per cent. of original cost for dividends and $1 00 per H. P. added for general business expenses	31.94
On the above basis, but allowing 10 per cent. for dividends	35.54

The next estimate was on the cost if the operation was variable, viz.:

a 20,000 H. P. 10 hours per day,
b 12,000 H. P. 10 hours per day,
c 5,000 H. P. 4 hours per day,

or a total of 63.8 per cent. of the maximum. Under these conditions he finds the cost to be $33.14, $37.74 and $41.84.

The third estimate was on the cost of power generated for only 10 hours a day. This he finds to be $15.17, $19.52 and $23.12.

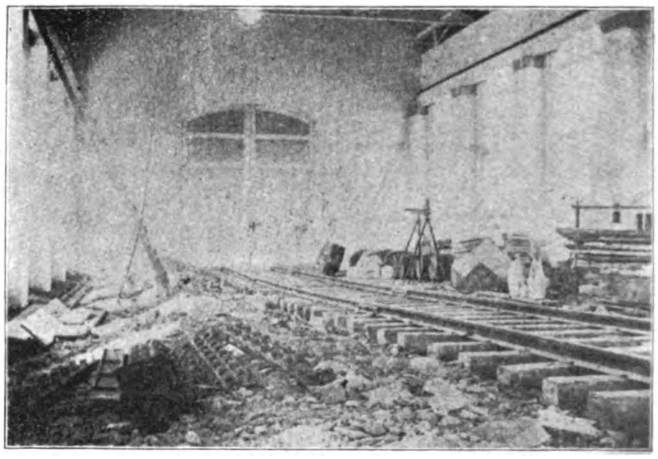
The author then went on to show how large a factor in the cost of power the fixed charges were, both in steam generated and in water power. In the estimate on the 10 hour basis the interest, taxes and cost of renewal amount to 48 per cent. of the total cost, which is given as $15.17 per year. The cost of steam power per H. P. per year from large units for 10 hours a day, without considering the above items, would therefore be only $7 89, "which," he said, "is the cost to be compared with the price of power from an external source when the items above referred to are excluded in each case as they are in the popular discussion of the subjects."

This paper gave rise to a most spirited discussion, much of it, however, by parties who misapprehended the facts or were unfamiliar with the author's earlier paper. It was a most significant fact, however, that during all of the discussion the practicability of transmitting the current to Buffalo to compete there with steam power was not once broached—the entire discussion being confined to the question as to whether or not the Niagara Power Company could compete in Niagara with locally generated steam power.

THURSDAY MORNING SESSION.

Mr. George Herbert Winslow read a most interesting paper on the Pomona (California) plant, entitled "Long Distance Power Transmission at 10,000 Volts." This paper described in detail a transmission from San Antonio Creek to Pomona, Cal., a distance of 13¾ miles, and another to San Bernardino, a distance of 28¾ miles. The motive power is the Pelton wheel. Step-up and step-down oil transformers are used with a 10,000 volt transmission current on a No. 7 B. & S. gauge wire. The San Bernardino line, which is the longest transmission now in opera-

INTERIOR OF BRIDGE GALLERY.



INTERIOR OF TRANSFORMER HOUSE.

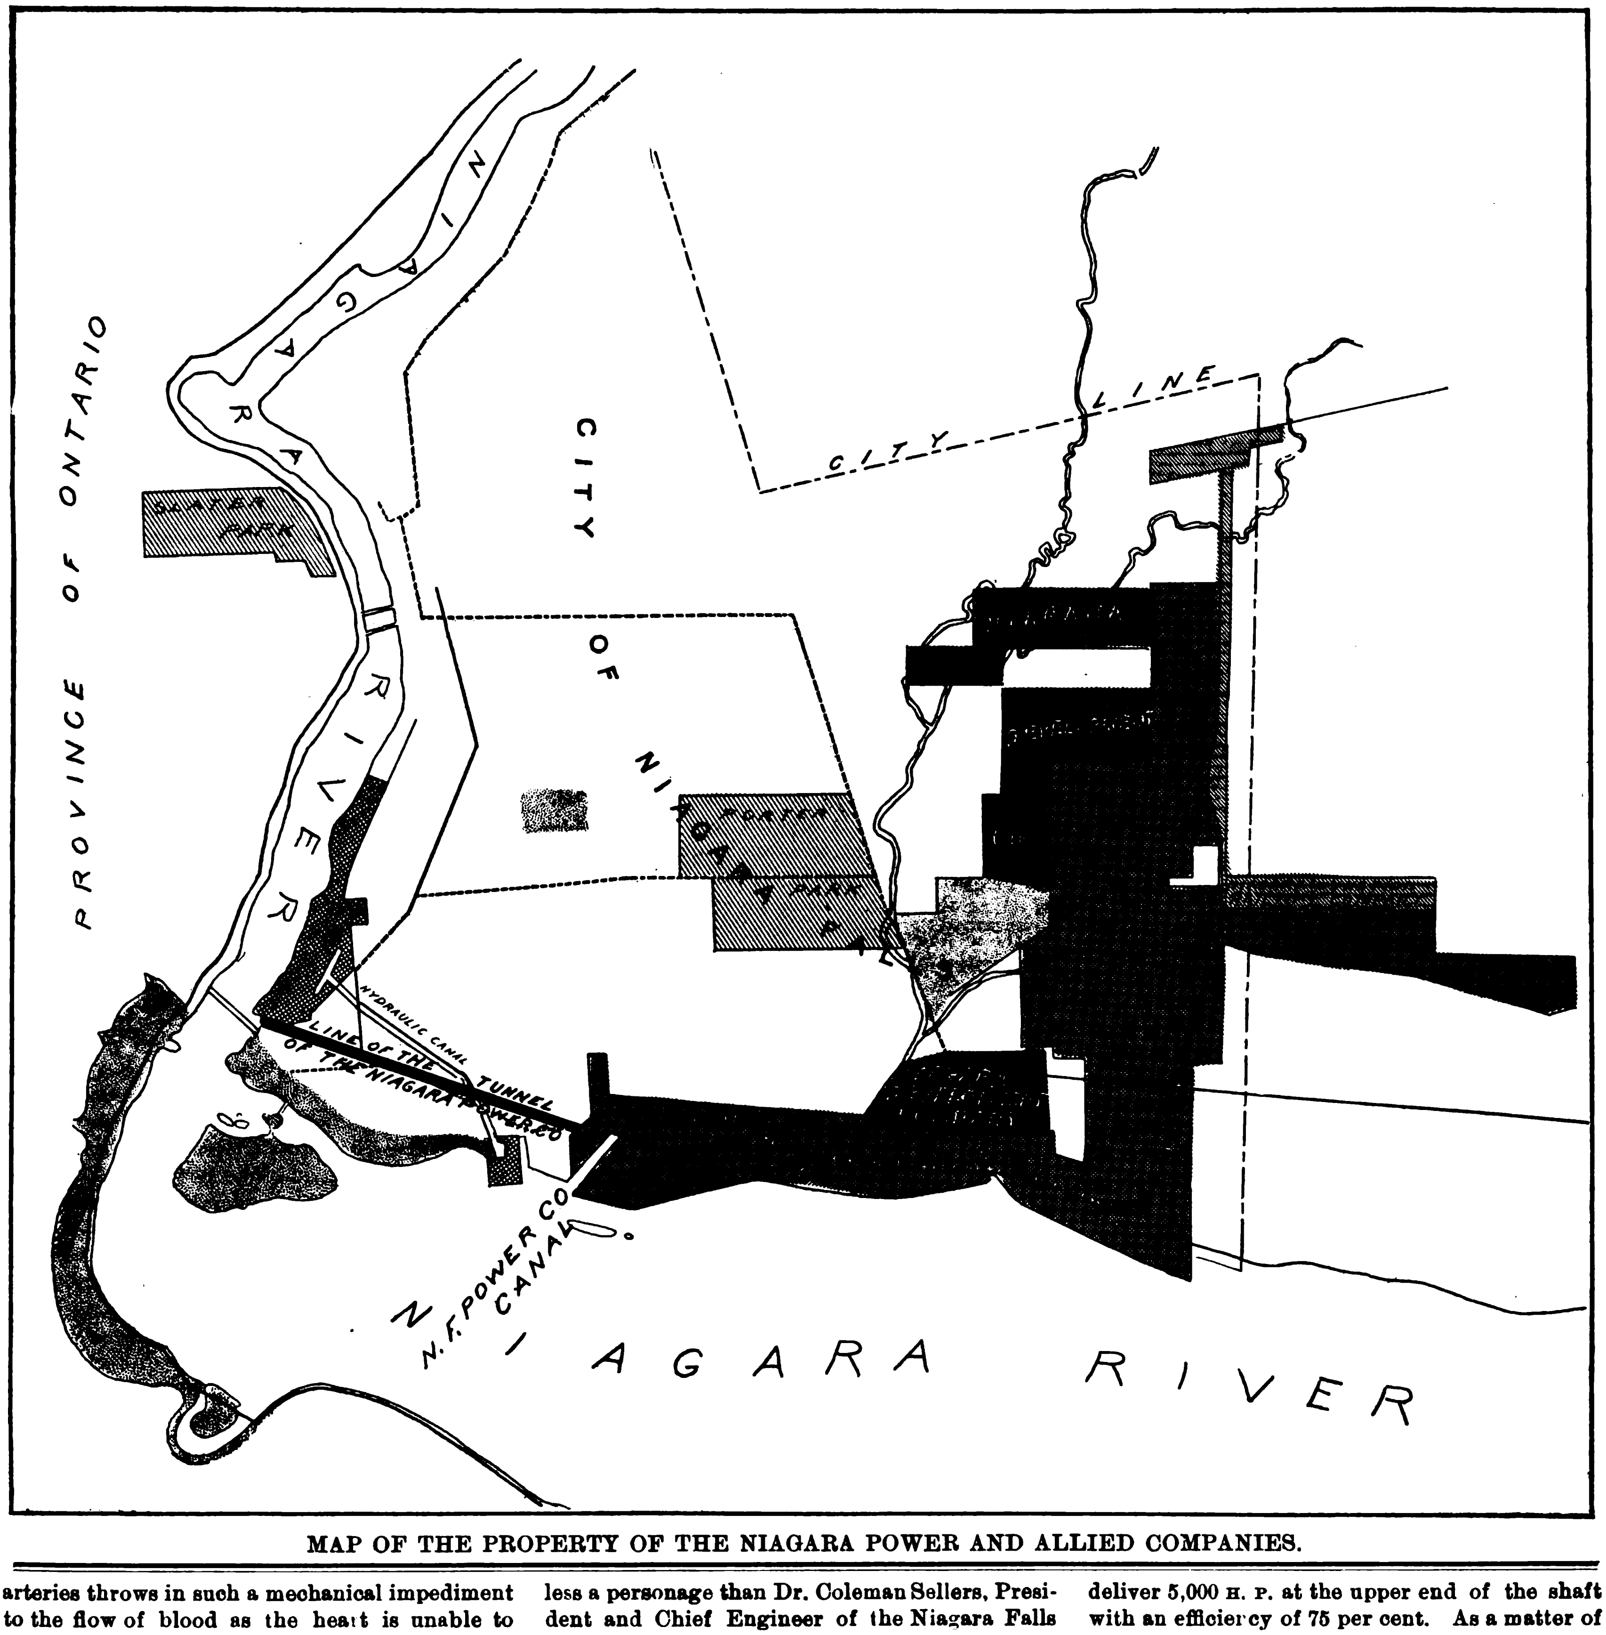
tion, is used for lighting purposes solely and competes with locally generated steam power produced from coal worth about $8 per ton.

Dr. Albert M. Bleile of Columbus, O., then read a paper "On the Cause of Death in Electric Shock," in which he held that death was not caused by the disintegrating effect of the current upon the brain and nerve tissues, as held by some writers, but that it was entirely due to the fact that the current produces a contraction of the arteries through an influence on the nervous system, and that the constriction of the arteries throws in such a mechanical impediment to the flow of blood as the heart is unable to overcome, and that where drugs are given to counteract this effect much larger doses of electricity than the ordinary can be borne.

These conclusions were reached from a number of experiments on dogs, the details of which are all given in the paper.

THURSDAY AFTERNOON.

The afternoon had been set apart for individual trips to the various points of interest about the Falls, and the visitors divided themselves into parties of twos and threes or more, and scattered as their individual tastes dictated. Your correspondent had arranged for another view of the great power plant, in order that he might avail himself of a more favorable opportunity of inspection than can be afforded when a crowd is present. He was given every opportunity of informing himself of the details of this magnificent monument to engineering science, his cicerone for a portion of the time being no less a personage than Dr. Coleman Sellers, President and Chief Engineer of the Niagara Falls Power Company. Dr. Sellers, who stands among the very first mechanical engineers of the world to-day, has been identified with the project from almost the start. He was the only American represented on the Niagara International Commission which invited and passed upon competitive plans and estimates for the great undertaking, and it is to him more than any other one man that is due the perfection of mechanical detail so conspicuous throughout the plant as a whole. In company with Mr. R. Baumann, the representative of Faesch & Piccard, the designers of the turbines, and under whose personal charge their erection has taken place, your representative witnessed the stopping and starting of the great dynamo. This was a spectacle not witnessed by many, and especially interesting as showing the perfection of mechanical detail which has been attained. Speaking particularly of the wheel and shaft, Dr. Sellers stated that the specifications required that the wheel should deliver 5,000 H. P. at the upper end of the shaft with an efficiency of 75 per cent. As a matter of fact the efficiency was considerably greater, and he would be surprised if it did not reach as high as 79 per cent. This is a most remarkable efficiency under the circumstances, but the length of time during which the machine continued to revolve after the water had been practically cut off indicated such an extremely low friction factor that the writer was fully prepared to believe even these remarkable figures.



MAP OF THE PROPERTY OF THE NIAGARA POWER AND ALLIED COMPANIES.

THURSDAY EVENING.

The paper by Mr. Stillwell on "The Work of the Westinghouse Electric and Manufacturing Company for the Cataract Construction Company," which it was known was to be a technical description of the electrical part of the Niagara power plant, had been announced for Thursday morning, but for various good reasons was postponed until the evening. In preparation for the occasion, which was looked forward to as *the* event of the literary portion of the meeting, additional chairs were provided in the large parlor.

An unexpected surprise and pleasure was in store, viz., an address from Dr. Sellers, who, perhaps better than any one else, was fitted to rehearse, first, the history of the movement which had resulted in the plant that was now in operation, and second, to give a brief description of the mechanical engineering problems that had been met and successfully solved.

Interesting and important as these were, we cannot give space to them here, but must refer the reader to *Cassier's Magazine* for July—the Niagara Power number, in which these are given in detail by those whose names will ever be associated with the undertaking. And here it may be proper to notice one of the many courtesies extended to the members of the Institute by the Cataract Construction Company, viz., the presentation with their compliments to each member of the Institute present of a copy of this magnificent number of *Cassier's*, which had been issued from the press in advance especially for this purpose.

MR. STILLWELL'S PAPER.

Mr. Stillwell's paper was an abstract of the official report of the Westinghouse Company, who constructed and installed the electric plant, to the president of the Niagara Construction Company, and as the full report will be published later, but a few points will be referred to here.

Speaking of the credit due for the plant as a whole, the author stated that although it must be gratifying to Americans that the system adopted had been developed by an American company, Switzerland, the land of water powers, had contributed the turbine designs; Great Britain was represented in the excellent general form of the dynamo, which was proposed by Prof. George Forbes, and indirectly in the work of Hopkinson, Kopp, Thompson, Mordey and others, through their careful study of the underlying principles of electrical machinery. "Perhaps no country is more largely or more creditably represented," he said, "than Sniljan Lika," referring to Nikola Tesla, whose two-phase system is the one employed exclusively in the plant.

The frequency of the current is 25 cycles per second. This is a compromise between that specified by Prof. Forbes and that which the Westinghouse Company at first suggested. By means of rheostats controlling the field circuits of the generators, the potential of the current delivered is adjustable up to the limit of 2,400 effective volts. Until transmission over great distances is undertaken, the normal potential will approximate 2,100 volts. Currents intended for transmission to long distances, as for example to Buffalo, will pass from the switchboard through lead covered cables in the power house subway and the bridge to the transformer house. There it will enter the step-up transformers, be raised to 20,000 volts for transmission, and transformed down again at the further end to potentials suitable for local distribution.

He stated that it is not intended to attempt to supply incandescent lights directly, because 25 cycles per second is rather low for such purposes. For this purpose motors would be driven directly, and these drive direct current generators. For power purposes, however, the frequency selected was admirably adapted. If the demand for light should become sufficient to warrant it, it was possible that a certain number of generators of higher frequency might be advisable.

The following data were given:

Height of generator, from bottom of bed plate to top of the floor of bridge, 11 feet 6 inches.

Diameter of bed plate, 14 feet.

Diameter of outside of revolving field ring, 11 feet $7\frac{1}{8}$ inches

Each generator delivers 5,000 electrical H. P. and requires 5,150 H. P. delivered through the turbine shaft to drive it under full load. Exclusive of the bridge, which has no electrical function, the entire machine could be placed in a room 15 feet cube.

Weight of each generator is 170,000 pounds, of which about 79,000 pounds are in the revolving element.

The speed is normally 250 revolutions per minute, and the fly-wheel effect, as before stated, is 1,274,000,000.

He referred to one prominent feature of the plan of construction adopted, viz., that the magnetic attraction between the centrally located stationary armature and the revolving exterior ring tended to counteract the strains due to centrifugal force. If the usual plan had been adopted, of revolving the armature inside of the field, the magnetic pull would be added to the centrifugal force.

He stated that at full load a heat equivalent of about 100 H. P., representing the loss in generator due to magnetization of the iron and the resistance of conductors, was generated in the machine, and to dissipate this special ventillating arrangements had been devised. Grooves cast in the hubs of the supporting spiders also permitted of water circulation to cool the bearings.

The armature core is built up of thin sheets of mild steel, No. 30 B. W. G., and to secure free circulation of air is divided horizontally into seven equal sections, separated from one another by one inch brass castings containing ample ventillating channels. Each layer of the core consists of eleven segments, so placed that the joints are staggered. These sheets are punched out of large sheets of best quality, .015 of an inch thick, by steel dies, and afterwards thoroughly annealed. The ring thus built up is tied together by 66 bolts of nickel steel carefully insulated from the core.

The armature conductors consist of copper bars $1\frac{1}{32}$ by $\frac{7}{16}$ inches in section. Two of these bars, carefully insulated, are placed in each of the 187 slots around the periphery of the armature core. The conductivity of the bars used is above 100 per cent. by Matthiesen's standard. In the case of the second generator the conductivity of the copper furnished by the Washburn & Moen Manufacturing Company is 102.6 per cent. The insulation used is chiefly mica, and was subjected to tests in the shop of 15,000 volts, and again at Niagara of 6,000 volts.

In regard to the revolving parts of the generator, which in this case is the field, he said the most interesting part of it was the great field magnet ring. This is of nickel steel forged in one piece by the Bethlehem Iron Company, who guaranteed that it should have a tensile strength of not less than 70,000 pounds per square inch and an elongation of about 25 per cent. in two inches. They had done better than this, for in tests over 82,000 pounds tensile strength and over 27 inches elongation were obtained with one test piece. The magnetic qualities of the ring were found, by careful tests, to be no less remarkable than the physical tests.

The pole pieces, which are of mild, open hearth steel, cast by the Midvale Steel Company, are wound with rectangular section conductors. The weight of each pole piece with its bobbin is 2,800 pounds. The factor of safety against rupture by centrifugal force of the ring with pole pieces and bobbins attached, of which there are twelve, when at full speed is nearly 4.

In testing the magnetic qualities of the ring the ring as a whole was tested by a method devised by Mr. Chas. F. Scott, who has done so much in connection with these large generators. It was also tested by sample by the Ewing method as well as by the permeameter method.

The final tests of the machine gave the following results:

Maximum loss in field copper..............	15 H. P.
Loss in armature core.......................	60 H. P.
Loss in armature conductors..............	30 H. P.
Total..	105 H. P.

Total mechanical, electrical and magnetic losses are given as 155 H. P. In order that 5,000 H. P. shall be delivered to the circuits it is necessary that 5,155 H. P. be applied to the machine. Dividing 5,000 by 5,155 gives almost exactly 97 per cent. as its efficiency.

The above is but the briefest abstract of all that Mr. Stillwell said, but it must suffice for the present. Both Dr. Seller and Mr. Stillwell illustrated their remarks by means of lantern projections which enabled the audience to follow their words more closely.

Among those who have contributed largely to the success of the electrical part of this installation and, to whom great credit is due, are Dr. Sellers, Prof. Forbes, Prof. Rowland, and Messrs. Stillwell, Albert Schmid, C. F. Scott, Philip Lange, O. B. Shallenberger, B. C. Lamme, E. C. Means, H. P. Davis, Sigfried, Wright, Boegel, W. F. Lamme, Beinitz, Alberger, Mirault, Friedlander, Strauss, Mould and Parks, also Mr. De Courcy May of the Cataract Construction Company.

FRIDAY MORNING.

On Friday Dr. Emery's paper on "Alternating Curves" was discussed. In his paper the author developed a system for formulating and integrating the values of instantaneous watts applicable to curves of different shapes, which include an approximate sine curve as a special case. It was argued that such a system should avoid the necessity of using "equivalent" values and enable the distortions of alternating curves to be explained directly by formulating the conditions which produce the same instead of considering arbitrary "harmonics," and the development was along these lines. Among other conclusions arrived at was that the most desirable curve for lighting purposes would be a rectangle, if that were practicable, and for power purposes the parabola. This latter conclusion was at variance with generally previously accepted views.

In the discussion of this paper, which was quite spirited, the generally expressed opinion was that the author's method of discussing alternating current curves was *not* an advantageous one and that by avoiding the sine curve with its harmonic modifications one of the most characteristic features of the subject discussed was eliminated.

Mr. Franklin Leonard Pope's paper on "Notes on the Reconstruction of a Small Central Station Plant" in the absence of the author was read by the secretary. This paper was an account of how the author had at small expense reconstructed an old station and thereby greatly widened its field of usefulness. It is a paper which will interest many station men and should be read in full.

The session closed with an excellent paper by W. L. R. Emmet, of Schenectady, N. Y., on "Existing Commercial Applications of Electrical Power from Niagara." This was a full description of the interesting electrical installation at the works of the Pittsburgh Reduction Company by the General Electric Company which has already been referred to.

ELECTRIC POWER IN FACTORIES AND MILLS.*

BY F. B. CROCKER, V. M. BENEDIKT AND A. F. ORMSBEE.*

INTRODUCTION.

The application of electric power distribution to the operation of factories and mills, including the driving of the various machines and other apparatus, is the latest and one of the most important problems towards which attention is now being directed, the question being one of extreme prominence both from an economical as well as from an engineering standpoint.

In comparing two or more different systems of power distribution, the fundamental basis of comparison is generally that of dollars and cents. This is certainly correct as far as it goes, but unless a very decided difference be found between the costs of running under the various systems, it may be found that other factors enter, factors which cannot be estimated in dollars and cents, namely, questions of desirability and convenience. Without considering any tests whatever, there are several exceedingly advantageous points in the use of motors in factories which are almost self evident, such as: 1. Clear and unobstructed passages and head room, the latter facilitating the use of traveling cranes. 2. Ease of shifting the tools from place to place, possibly necessitating the placing of a starting box, and the putting up of a little extra wire, as compared with the inconvenience and trouble of setting up and adjusting a line of shafting, hangers, belts, etc. 3. The economy due to the ability to run a single tool without necessarily starting the whole factory or at least a complete section. 4. The running expense is entirely stopped when the tool is shut down. 5. The absence of the drip of oil from overhead shafting. 6. The tools may be placed at any desired points almost regardless of the distance. 7. It is not necessary to arrange the tools parallel as in the mechanical system. 8. A wider range of speed is possible. 9. Less damage caused by a fuse blowing than by a belt slipping off in case of accident or excessive load.

Considerations like the above have great weight in deciding a question such as that under discussion, and there is no doubt whatever that in most cases they rise to such prominence that they warrant a complete change from the old system to the new, even though there is no gain in economy or increased output. In most cases, however, it has been conclusively shown that considerable saving and increase in production is obtained, one test showing a very considerable percentage of increase in the output. The partial, if not the complete, displacement of the old method by the new is only a question of time, and it was the appreciation of this fact that induced the authors to undertake the determination of the power actually required to run the various tools and machines as used in ordinary practice.

HISTORICAL NOTES.

The subject is a comparatively new one, not dating back further than about 1890, hence the history of the subject is necessarily short. About five years ago motors were in operation in the works of the Thomson-Houston Company at Lynn, the Crocker-Wheeler Company and the C. and C. Company. Shortly afterward the great German works of the Siemens & Halske Company and the Allgemeine Elektricitäts Gesellschaft began using motors to operate sections of their factories. From that time to the present the use of motors has extended rapidly, until now they have been adopted in many factories all over this country and to a less extent abroad.

PRACTICAL TESTS.

In the tests which follow, the power required to drive the tools was obtained by placing an ammeter in circuit of the motors running the various machines and groups of machines, and taking readings every few seconds, the frequency of the readings depending upon the nature of the tool and the work it was doing. The potential was practically constant at 110 volts, not varying more than one or two per cent. The first tests were made at the factory of the Crocker-Wheeler Electric Company at Ampere, N. J., and the machines tested and the results obtained were as follows:

1. *Large Boring Machine.*—This machine was driven by a 1½ H. P. motor, speed 1,200 R. P. M., mounted directly on the frame of the tool, the reduction in speed being obtained by the use of gearing. During this test, which lasted three hours, the machine was used for turning down a commutator for a 100 H. P. dynamo. The average current drawn was 8.8 amperes, representing 1.28 H. P. at 110 volts. Before the run was finished, the speed of the tool was increased by changing the combination of gears, and during this time the power required was 1.48 H. P. When the machine was started from rest, the rush of current was considerable, the average being 17.75 amperes, representing 2.6 H. P. It will be seen that this motor is well suited to the machine, the average load being very close to the rated power of the motor.

2. *Drill Press.*—A drill press was run by a 1 H. P. motor, speed 545 R. P. M., mounted on a shelf at top of press and belted down to countershaft at bottom and thence up again to main shaft of machine, thus securing a reduction of the speed. This machine was boring the faces of the cast steel pole-pieces of a 10 H. P. motor, two cutting tools being used. The test lasted 4 hours and 40 minutes and during this time the pole-pieces for three motors were bored. The first run covered 1 hour and 10 minutes and the average current was 2.92 amperes, representing .48 H. P. It required 15 minutes to replace the completed pole-piece by another one. This second piece required 2 hours and 32 minutes to finish, and the average amperes was 2.82 or .41 H. P. This time it required 17 minutes to replace the piece and then the machine ran only 23 minutes until closing time. The current for this short run was 2.81 amperes, representing .41 H. P. The total length of time the machine was running was 4 hours and 5 minutes. Therefore power was supplied to the motor 86 per cent. of the time of the test.

3. *Drill Press.*—This machine was similar to the one preceding, but the work was different, namely, drilling half inch holes in cast-iron bearings. The average current was 2.86 amperes, which represents .42 H. P.

4. *Drill Press.*—This tool was the same as the other two and the work consisted in boring the inside of cast-iron bearings. The average in this case was 1.9 amperes or .28 H. P. It will be noticed that in the case of these three machines a motor of one-half H. P. would be of ample size to do the work.

5. *Punch Press.*—This was a small punch run by a 1 H. P. motor mounted on the base of the machine and belted to its heavy fly-wheel. The speed of the motor was 700 R. P. M. This tool was punching slots in sheet iron disks for a 10 H. P. armature, there being 28 slots in each disk. The motor was turned off every time a disk was replaced, but it did not come to a dead stop as the inertia of the fly-wheel was so great. Readings were taken every five seconds and the time of turning on and off the current was noted. The test lasted 57 minutes, during which time the current was turned on for 35 minutes and 45 seconds, or 62.7 per cent. of the time. The average current was 4.86 amperes, equivalent to .71 H. P. The rush of current at starting varied from 7 to 15 amperes, depending upon the haste of the workman in turning on the starting box.

6. *Gang Drill.*—This tool was driven by a 1 H. P. motor, 1,000 R. P. M., mounted with vertical shaft in frame of the machine and belted directly to the three drill spindles. The material drilled was cast-iron and the sizes of the holes were ¼ in. and ⅜ in. The average of the readings taken was 4.75 amperes or .7 H. P. When the drills were running free the motor took 3.5 amperes. Thus the power required to overcome friction was 74 per cent of the power used while drilling.

7. *Group of Two Machines,* 1 *Lathe and* 1 *Milling Machine.*—This group was driven by a 3 H. P. motor, belted to a short line shaft, from which belts ran to the countershafts above the two machines. The average current was 10.04 amperes, the power being 1.48 H. P. In this test special attention was paid as to which machine happened to be running free, cutting, etc., with the results given in the following table:

Class of Machines and Work.	Amperes.	H. P.
Milling machine running free—lathe at rest	5.67	.836
Lathe machine running free—miller at rest	7.23	1.065
Both running free	10.	1.47
Milling machine cutting—lathe running free	10.33	1.52
Lathe cutting—milling tool running free	14.42	2.12
Both tools cutting	15.4	2.28
Cutting rate increased on the lathe	17.8	2.61

8. *Group of Six Machines, consisting of* 1 *Milling Machine* (*small*), 2 *Lathes* (10 *or* 12 *inch swing*), 1 *Grindstone*, 1 *Drill Press and* 1 *Small Punch Press.*—The last named tool was not run at all during the test and the grindstone ran continuously. This group was run by a one H.P. motor, belted to the usual ceiling line shaft. The average current required to drive these machines was 5.86 amperes, representing .86 H. P. Thus this motor ran at about its most economical load.

9. *Group of Seven Machines,* 1 *Planer* (*small*), 1 *Grindstone,* 4 *Lathes,* 1 *Hand-Turning Lathe.*—A 3 H. P. motor was used to drive this group, being belted to a line shaft, the same as in the previous groups. The current was 13.36 amperes or 1.97 H. P. When the entire group was in use 2.65 H. P. was required.

10. *Group of Seven Lathes and* 1 *Grindstone, Driven by a* 3 *H. P. Motor.*—The average current was 9.92 amperes and the power required was therefore 1.46 H.P. The power used by the motor when different numbers of lathes were running is shown by the following table:

Number of Lathes Running.	Amperes.	H. P.
One	7.76	1.14
Two	9.16	1.35
Three	10.69	1.58
Four	12.23	1.8

Thus, in a group like this, it only takes 68 per cent. more power to drive four lathes than it does to run one, the reason being the fact that it probably takes about 1 H. P. to drive the countershafts.

11. *Group of Two Machines, a Large Punch Press and a Large Planer.*—The motor for running this group was placed on the floor and drove a short line shaft on the ceiling by the usual form of belt. The rated capacity of this motor was 7½ H. P., and its speed was 1,350 R. P. M. The punch press did not run during the test. With the planer idle and motor driving the shafting and belting alone the current was 15.5 amperes,

---

* A paper presented at the Twelfth General Meeting of the American Institute of Electrical Engineers, Niagara Falls, N. Y., June 26, 1895.

which represents 2.8 H. P. While the planer was at work the motor required 33.1 amperes or 4.87 H. P. As the loss from friction in the shafting is nearly constant under the variation of load, the power required to overcome this friction was 47 per cent. of the total power used. When the bed of the planer reversed from its slow cutting stroke to the comparatively rapid return stroke, the current increased to 52 amperes, showing an expenditure of 7.6 H. P. for a few seconds. This tool was planing the frame of a 90 K. W. multipolar dynamo, the material being cast-iron.

12. This group was a very large one, consisting of 20 machines—8 lathes, 4 milling machines, 3 planers and shapers, 2 grindstones, 1 vertical shaft grinding machine and 3 small tools. The motor in this case was rated at 10 H. P. at 750 R. P. M. A Thomson recording wattmeter was placed in the circuit of this motor for one afternoon. At the end of this time the wattmeter showed a total of 17,854 watt hours used, and as the time was five hours, the average power was 3,571 watts or 4.78 H. P. The average number of machines running was 13, most of the lathes being in use the greater part of the time. An ammeter was inserted in the circuit of the motor for a few minutes and it was noted that the work was very steady, the current not varying more than 3 or 4 amperes at any time.

13. A group of five machines run by a 3 H. P. motor was next tested. Of these five machines one was a lathe with 17 inches swing and 8 feet bed, one was a slotter, and the other three were lathes of 12 or 14 inches swing. The average amperes was 7 and the power 1.03 H. P.

14. The last tool tested at this factory was a large new engine lathe, which had been just set up, of 50 inch swing. This tool was driven by a 3 H. P. motor mounted on an iron bracket built in the base of the machine. The motion of the motor shaft is transmitted to the tool by gears, thus doing away with all belts. The work done was turning a 5½ inch steel shaft for a 200 K. W. dynamo, facing the ends, etc., the cut being very light, as the work was only preliminary. The average current consumption was 11.3 amperes. Hence the average power was 1.68 H. P.

The following tests were made in the erecting shop of the De La Vergne Refrigerating Machine Company, Port Morris, N. Y.:

1. *Planer.*—A large planer, 120 inches between posts, by 108 inches high, by 22 feet bed was driven by a C. and C. motor of 15 H. P. The voltage employed was supposed to be 220, but due to an incorrect station voltmeter the actual potential only averaged 190 volts on the morning of this test. The average current was found to be 20.08 amperes, which at 190 volts represents 5.11 H. P. At the reversal from the cutting to the back stroke the current increased to 85 amperes, equivalent to 21.65 H. P. The power required during the cutting stroke was 4.76 H. P., while on the return stroke the average was 5.73 H. P.

2. *Drill Press.*—A drill press driven by a 5 H. P. C. and C. motor was tested in the afternoon. The potential was raised before this test so that the average was 215 volts. The power required when drilling various size holes is shown in the following table:

Size of Drill.	Amperes.	H. P
Running Free.	3.	.865
½ in.	4.07	1.23
[illegible] in.	4.37	1.26
[illegible] in.	4.6	1.33

3. *Corliss Cylinder Boxing Machine.*—This tool was driven by a 10 H. P. C. and C. motor and was boring the brass boxes, 6¾ inches diameter, of the main shaft bearing of a large ice machine. The average current was 14.47 amperes, representing 4.17 H. P. at 215 volts.

In order to place the results in a more convenient form the following table of average powers was compiled:

TESTS AT THE CROCKER-WHEELER FACTORY.

No. of Test	Size of Motor	Number of tools driven by motor	Average Amperes	Average horse power	Remarks.
1	1.5 H. P.	1 boring machine	.83	.23	
2	1. "	1 drill press.	2.25	.40	Less than ½ full load of motor
3	1. "	1 " "	2.36	.42	
4	1. "	1 " "	1.9	.26	
5	1. "	1 punch press.	4.86	.71	
6	1. "	1 gang drill.	4.73	.7	Drilling ¼ in. and ⅜ in. holes.
7	3. "	2 machines.	10.04	1.48	
8	1.5 "	6 "	3.20	.86	All small machines.
9	3. "	7 "	13.36	1.97	
10	3. "	8 "	9.90	1.40	
11	7.5 "	8 "	33.1	4.87	Required 2.8 H. P. to run shafting only.
12	10. "	20 "		4.78	Tested by Watt meter.
13	3. "	5 "	7.0	1.03	
14	3 "	1 engine lathe	11.4	1.68	Light cut taken by tool.

TESTS AT THE DE LA VERGNE WORKS.

1	15. H. P.	1 planer	20.08	5.11	Planer 120 in. x 108 in. x 22 ft. Voltage 190.
2	5. "	1 drill press.	4.07	1.23	½ in. drill. Voltage 215.
3	10. "	1 boring tool.	14.47	4.17	Voltage 215.

The results obtained in these tests show that the power required to drive machine tools has been considerably overestimated, for it will be noted that with a large majority of the tools tested the motor was not more than one-half loaded, and in these cases it was seldom that the load equalled the full power of the motor even for an instant. In the case of the large planer, although the motor was overloaded 50 per cent. upon reversal of the bed, the average load was only one-third of the rated full load. With this machine, however, when the piece of work is very short, necessitating more rapid reversals, the average load will be much nearer the most economical output of the motor.

(To be continued.)

THE SUBSTITUTION OF ELECTRICITY FOR STEAM IN RAILWAY PRACTICE.*

BY DR. LOUIS DUNCAN.

In an address delivered before this Institute in June, 1892, Mr. Frank J. Sprague spoke of the coming development of electricity as supplied to railways, and outlined his views as to the direction of this development. In the last three years great extensions have been made in electrical transportation, and it seems well to review briefly the amount of these extensions and their direction. In this paper I shall consider electric traction as it stands at present, not the possibilities of the future, and will briefly take up the following questions:

1st. Given a railroad system at present operated by steam, will it pay to change entirely to electricity or to make a partial substitution, and how should the change be made?

2d. If entirely new lines are to be built, is it likely that it will pay to equip them electrically? How should they be equipped?

3d. I will describe the equipment of the Baltimore and Ohio tunnel plant, and draw from it what moral I can.

There are two very distinct sides to the question of transportation, the passenger side and the freight side, and their requirements for good service are very different. First taking up the question of passenger travel, the receipts of road are increased by running trains at short intervals and at high speeds, and this is a condition peculiarly favorable to electricity. On an electric line short trains, equally distributed over the track, give a greater station efficiency, and the lowest cost of equipment of both station and line. The cost of train service is somewhat greater, but is compensated by the saving in the other items.

The cost of hauling a given number of passengers between given points by steam is greatly increased when the number of trains is increased, the efficiency is less, and the cost of equipment and of train service is greater. Wellington states that doubling the number of engines for a given traffic increases the cost of transportation about 50 per cent.

On the other hand, if you take up the question of freight traffic, the conditions of greatest economy are reached when trains of a maximum weight are hauled by a single locomotive. In attempting to carry on traffic of this kind by electrical locomotives operated from a central station we find that we are at a great disadvantage because of the irregular service necessitated by the freight traffic and the unequal distribution of the load along the line. Suppose, for instance, that there were two stations supplying the line and that the traffic was uniformly distributed along it, then the capacity of each station would be one-half of the total required capacity. Suppose, however, that the entire traffic was concentrated in one train, then each station would have to have a capacity equal to the total power required for hauling the entire traffic, as the train would be first supplied from one station and then from the other. The line also would have to have a capacity suitable for handling the total traffic. If a number of heavy trains were used, and the traffic was irregular and liable to be congested at one point, as in the case of freight service, then again the capacity of the station would have to be greater than that required to supply one-half of the normal traffic. If we were to decide to transmit the current to a longer distance and to supply all the track from one station, using transformer devices along the line, then the capacity of the station itself would only be that required for the normal traffic of the line, but the transformer devices would have to be sufficient to handle the maximum traffic of the section which they supplied and would have to be given a capacity greatly in excess of the average load in order to supply this energy. We must distinctly bear in mind in considering the application of electricity to steam roads any departure from a uniform distribution of load along the line will increase both the cost of equipment and the cost of operation.

The amount of freight transported per train mile has more than doubled and the expense has decreased more than one-half during the past 20 years. The passengers per train mile, on the other hand, have decreased and the expenses have changed only a slight amount, notwithstanding the greater economies that have been put in force in the interval. Passenger traffic has come in the direction in which electricity is the most economical for transportation; freight traffic, on the other hand, has gone in the direction where electricity becomes most costly.

Suppose, then, the question comes up before the managers of a road as to whether they are to equip their lines to be operated entirely by electricity. It seems to me, as matters now stand, it will not pay trunk lines to change the method of operation for freight traffic, and the question to be considered would be the operating of the lines partly by steam and partly by electricity. Let us consider if it is possible to run the passenger service wholly or partly by electricity. Considering a two track road doing a through as well as a local business, I think we can decide that unless the case be an exceptional one it will not pay to equip the main line electrically. It is necessary that the through express service be continued, and that the freight service be continued, and an attempt to operate the local trains with the through trains could not be successful if there was any considerable amount of through traffic. With a four track road the condition of affairs is somewhat different. If the road operates between cities acting as terminal points for all passenger traffic, as with some of the lines between Boston and New York, then by equipping all four tracks it would be possible to run express service at short intervals on two of the tracks and on the other two tracks to run freight and local trains. At present it would not pay to use electric locomotives operated from a central station for the freight service, but the local service could be operated electrically, and as the speed of the local trains would be approximately equal to that of the freight, there need be no serious interference with the traffic. We would then have express passenger service working under favorable conditions—that is, with a number of trains evenly distributed,—a local service operated under similarly favorable conditions and with no interruption to the freight traffic. If the road, however, is to transport a considerable number of foreign cars, as, for example, the New York Central or the Pennsylvania Railroad, then the condition of affairs for express service would not be so favorable, and the question of the equipment of the tracks for express service would have to be carefully considered. As far as the branch lines go, whether it would pay to partially or wholly substitute electricity for steam depends upon the local conditions. A long branch with a small amount of local traffic it would not pay to equip, but on a short branch with considerable passenger traffic and comparatively little freight traffic such equipment would pay. I find that in 1892 the total number of through passengers carried by the New York Central road was 234,650, while the number of local passengers was 21,978,979. It will be seen that the through traffic is but a small percentage of the total number of passengers, and that the question of preserving the local traffic is of great importance. Now the greater part of this local traffic will in the next few years be taken by the electric roads paralleling the steam roads unless some effort is made either to control the electric roads or to give an equally good service between adjacent towns. This latter is possible using the ordinary steam tracks only when the distances between towns are small and the amount of freight or through traffic is also small.

---

* Abstract of Inaugural Address to the American Institute of Electrical Engineers, Niagara Falls, June 25, 1895.

There are certain kinds of local traffic which the steam roads must, to a large extent, lose, and which in the nature of things they cannot regain. In large cities having a considerable suburban traffic the trolley roads, forming as they do a network of lines within the city and extending in every direction into the suburbs, offer advantages with which the steam roads cannot compete. In Philadelphia one of the large steam lines lost so much traffic that it has attempted to regain it by reducing prices and increasing the number of trains. In this effort it has partly succeeded, but at the cost of greater expense and decreased receipts. To counterbalance this loss at central points, railroads may hope by the introduction of electricity to increase their earnings along the lines and on their branches.

As to the nature of the equipment that will be required, it would depend on the work to be done and the branch that is to be equipped. In some cases it might be well to use single electric cars running on the steam tracks between towns and on the local tram lines in the towns. As the speed would be very different in the town and on the railroad line, and as the voltage could also be different, it would be well in this case to use a number of motors on the car, and to use a series parallel controller, the motors being in series for the town traffic. For instance, suppose we wish to run at a maximum speed of forty miles per hour between two towns and it is economical to use 1,000 volts on the line, we could use the motors on the car, running them in parallel on the main line at a speed of forty miles per hour, while in town, with a voltage of 500, we could run them in series at a speed of ten miles per hour. I can hardly imagine a case where the three-wire system could be economically used for such service on the steam lines.

The condition of affairs in electric transportation is at present curious. The trolley companies by extending their lines are working from tramway transportation to through transportation. They are attacking the problem by development from small motors to larger ones. The railroad companies starting with the large units are coming down in the direction of the present trolley systems, as in the case of the Nantasket Beach road, of the New York, New Haven and Hartford Railroad Company. Perhaps in the future they will meet and some standard electrical system will be adopted for the present steam road. I think then that in the case taken up the policy of the road will be to equip those branches for which the conditions are favorable with a trolley, and run comparatively large motor cars capable of drawing one or two ordinary passenger or freight cars as trailers, using the present steam service for their freight traffic when necessary. This will allow the necessary through travel, will give the required local service between towns and will not interfere with the freight traffic.

As for the systems to be used for such service, I believe that at the present moment the continuous current overhead trolley system is the only one that can be selected with a certainty of successful operation. It gives a minimum complication in the way of conveying the current to the cars, it allows a considerable range of speed with a comparatively high efficiency, and our experience with it is such that successful operation could be at once guaranteed. By using different voltages in the towns and on the line both high and low speeds can be obtained. If the line to be operated is very long it might be best to use rotary transformers at different sub-stations along it, the line being supplied by continuous currents from the sub-stations. In fact the three systems that are at present possible are—first, the ordinary direct current system; second, a system in which direct currents are used on the line and rotary transformers supplied by alternating currents are placed along it, and third, a two or three phase system supplying rotary field motors on the cars. In the latter case it would be well to employ different periods in the towns and on the lines.

The second case which I wish to consider is that of roads built for an entirely new electrical equipment, such, for instance, as the elevated roads in Chicago and the underground rapid transit road in New York, or the proposed Washington-Baltimore Boulevard Line. In most of these cases the traffic is almost entirely a passenger traffic, and the conditions are especially favorable for the operation of electricity. Taking first the case of the New York underground road, there will probably be required about 150 trains for local service, each train having five ordinary cars and a motor car. For the express service there would be about twenty-five trains of, say, four ordinary cars with a motor car. For this it would probably be best to use the direct current three-wire system, one of the cars on the train being equipped with motors and acting as a locomotive. With four motors on a car the system would be efficient at all practical speeds, and if desired a large part of the energy could be thrown back on the line when the cars are being stopped. In the case of the local trains a simple calculation will show that a very small part of the total energy expended is used in overcoming the track resistance, while a very considerable part is employed in accelerating the train and afterwards wasted by braking. I have calculated the amount of energy which can be practically saved under the conditions of local and express traffic on the New York underground road, and find that with motors of ordinary efficiency about 45 per cent. can be returned. If storage batteries are used in connection with the central stations, the batteries being located along the line, a uniform load can be thrown on the stations, and their capacity may be reduced to almost one-half as compared with a system in which the energy is not returned, thus greatly decreasing both the expense of installation and of operation. As it is possible at present to obtain batteries with a rapid discharge rate at very reasonable prices, and with a guarantee for repairs that places them well within the limit of commercial calculations, a system of this kind offers some advantages over any other system that could be applied to the operation of the underground road. An alternating current would hardly be economical for this work, as it precludes the possibility of returning the energy to the line, and as the variable speed required makes it uneconomical as compared with the direct current system using, say, four motors with series parallel control. In the case above cited shunt motors would be used, and it would be possible to get a contact with the line that could not under any circumstances be broken. The case of the elevated roads is very similar to the one I have cited, except that in existing structures shorter trains would be used, and the cost of equipment for a given number of cars would be somewhat greater.

The last subject which I wish to take up is the electric plant for the Belt Line tunnel of the Baltimore and Ohio Railroad.

The immense locomotive for the Belt Line tunnel is the first instance of the direct displacement of steam by electricity, and the line over which it is to be operated is the first through steam line to be equipped electrically. Speeds of 60 miles per hour are to be used for the cars outside of the city limits, and within the city limits ordinary speed is to be employed. In this case there is no question of economy in the employment of the electric locomotives, as the plant adds considerably to the cost of operating the road. The Belt Line tunnel runs beneath the city of Baltimore for a distance of one and one-quarter miles, then to the outskirts of town, through open cuts and short tunnels. There is a grade of .8 of one per cent. over almost the entire length of the tunnel proper, while one-half mile beyond it there is a grade of one and one-half per cent. Being in the middle of the town it would have been difficult to provide a satisfactory ventilating plant even supposing that ventilating plants had been successful in other localities, which is not the case. The managers of the Baltimore and Ohio Railroad Company wished to provide a satisfactory service and considered a number of plans for drawing their trains through the tunnel without the annoyance due to smoke and gases. After careful consideration they concluded that electricity was the most satisfactory means to accomplish this.

In this paper I have not indulged in prophecy, nor have I imagined any apparatus or equipment which cannot be bought in the open market. But to me it seems that the present is a crisis in the history of railroading. Up to the present the steam roads have ignored the competition of electric roads or they have fought them. To-day they cannot afford to do either. In a few years electric roads will have absorbed practically all of the local traffic and will begin to cut into through transportation. The steam roads cannot afford this, their only safety is to make of electricity an ally instead of an enemy, and this before it is too late.

The conclusions that I finally reach are these :

1st. The tendency of passenger transportation on the steam lines has been in the direction of the greatest electrical economy, while the tendency of the freight transportation has been in the direction of the least electrical economy.

2d. It will not pay any through line with considerable traffic, having two tracks, to equip their main tracks electrically.

3d. With four track roads, it will pay to equip all of the tracks electrically unless a considerable portion of the business is through passenger traffic.

4th. It will pay all the larger roads either to equip a number of their branch lines electrically or to control competing electric lines.

5th. In order to remain on a dividend paying basis it is imperative that most of the two track lines either build additional tracks or control the electric roads that parallel them.

6th. Believing that ultimately all of the traffic will be done by electricity, it is imperative that the managers of steam roads keep constantly in touch with electrical progress.

(To be continued.)

NOTES ON THE RECONSTRUCTION OF A SMALL CENTRAL STATION PLANT.[*]

BY FRANKLIN L. POPE.

The financial condition of the smaller central station electric lighting plants throughout the country is at the present time by no means satisfactory, and in too many instances cannot even be truthfully said to be encouraging. A survey of the field shows that very few such plants located in towns having less than 10,000 inhabitants are earning more money than is necessary to meet their operating expenses and to provide for indispensable current repairs. In the State of Massachusetts, in which the operations of all electric lighting companies are by law made a matter of public record, it appears from the latest reports that the aggregate liabilities of the fifty-seven companies operating in that State, including stocks, bonds and floating indebtedness, amounted on June 30, 1894, in round numbers to $14,000,000, nearly all of which stands charged to construction account. The net earnings for the preceding year were $1,000,000, or about 7.1 per cent. on the total investment: a sum obviously quite insufficient to provide for depreciation and at the same time pay a fair dividend on the capital which has gone into the business. But if half a dozen of the larger plants, in cities like Boston, Lowell, Worcester, Springfield, Lynn and Fall River, were excluded from the list, the showing for the smaller plants would be even far worse than it now appears.

Many of these small plants were started at an earlier day than could have been justified by any reasonable estimate of the business then in sight, and now find themselves hampered by inconvenient buildings, and with unsuitable machinery bought at high prices, and encumbered with defective business methods which experience has shown to be wholly inconsistent with the dictates of good judgment.

With the owners of many of these plants it has become a very serious question whether the easiest way out of the dilemma which confronts them may not be to relegate the entire plant to the junk-shop and the scrap-pile, and commence over again with new buildings, modern machinery and improved methods of administration. When the necessary capital is readily forthcoming, there can be no doubt that this would often be the wisest course of procedure, but for obvious reasons, it is one which is not always, nor even usually practicable. The alternative is to remodel the existing plant, bringing it as nearly as may be into accordance with the best modern practice, and utilizing as far as possible the old material, a course which at least has the merit of avoiding an undue expansion of the construction account, in most cases already sufficiently burdensome.

Having been called upon during the past year to advise the owners of a plant of the character above referred to, in reference to certain changes which had been suggested as desirable, and having afterwards been employed in a professional capacity to design the work and superintend its execution, I have thought that some account of what we undertook to do and how we did it might not be without interest to the members of the Institute.

The Great Barrington (Mass.) Electric Light Company was organized and commenced business in 1888. The population of the district intended to be served was about 3,000, and most of the expected consumers were located within 2,000 feet of the point decided upon for the station. This was built of wood in the most inexpensive manner possible, and was placed alongside the railroad for convenience in receiving coal, although at the same time the danger from fire was materially increased. The original outfit was an Edison 3-wire, equipped with a pair of 250-light 110 volt dynamos, and the company commenced business with 281 lights on contract at $10 per year each, wiring free. The center of distribution was 1,800 feet from the station, necessitating over a ton of copper in the feeders alone. Generally speaking, the plant was well laid out, and well built as things went in those days. The two dynamos were belted to a single 80 H. P. Armington & Sims engine. The original cost of the plant was about $16,000. The following year a Schuyler arc plant for street-lighting was added, carrying 35 arcs, nominally of 1,500 C. P., which was run from the same engine and boiler. In 1890, the plant was considerably enlarged by the addition of a second arc machine, a Westinghouse 500-light alternator, and a second engine and boiler of the same capacity as the first. An 80 K. W. Westinghouse dynamo of more modern type was afterwards substituted for the original one.

Upon examining the plant last year, I found the Edison machines carrying on Saturday evenings a maximum load of some 450 lights, while three evenings in the week (with the stores closed) it fell to perhaps half that amount. The two Schuyler machines, with an aggregate capacity of 55 to 60 lights, were carrying about 38 to 40 or an equivalent of that amount, while the Westinghouse machine was seldom as much as half-loaded, carrying a maximum of possibly 500 lights during three or four months of the summer season, and not much more than one-fourth that amount the remainder of the year. Necessarily, with so many dynamos of different types, and with such a variable, yet small average output, the consumption of coal was excessive as compared with the light delivered and paid for.

The street lines, according to the usual practice, were of No. 6 B. & S. weather-proof wire; the poles were of cedar of good size and fitted with pine or spruce cross-arms, with common green glass insulators set upon wooden pins. In consequence of a silly prejudice, which had been fomented amongst the citizens by interested parties against permitting poles to be set in the streets, the wires, in a very great number of instances, had been attached, by cross-arms or brackets, to the trunks of the immense elm trees with which the streets of the town were shaded, a practice which occasioned an enormous loss of current every wet night as well as much irregularity in the performance of the lights. The effect on the trees was by no means salutary, while the appearance was as much worse than that of poles in the streets as could possibly be imagined.

The village of Great Barrington extends for the most part along a single broad thoroughfare for a distance of nearly three miles, and the street-lighting circuits are consequently very straggling. The 1,500 C. P. lamps, which were suspended at intervals of 800 to 1,000 feet, were actually of very little service in illuminating the densely shaded streets.

After a careful consideration of the situation, keeping in view the greatest possible reduction of present and future operating expenses, it was determined the wisest course to pursue would be to consolidate the whole service so that it could be supplied by one dynamo in place of five underloaded ones. In pursuance of this plan it was decided to adopt the two-phase alternating system, at a maximum pressure of 2,100 volts in the primaries, and 105 volts in the secondaries, with a frequency sufficiently low to permit the advantageous use of induction motors if required. It was furthermore decided to abandon the steam plant and to make arrangements to utilize some one of the excellent water-powers which were available within practicable distances. Under ordinary circumstances, I should have hesitated to recommend the substitution of water-power for steam as the sole source of power for the operation of an electric lighting plant. Water-power is an invaluable auxiliary, and when conveniently available for use in conjunction with steam, may often be made to save a very large coal-bill in the course of a year. On the other hand, the excessive fluctuations to which it is subject—which are scarcely realized by those but casually acquainted with the subject—render it in most cases a very uncertain reliance for a business which is compelled to go on, perforce, every night in the year, and which cannot suspend operations, as an ordinary manufactory does, if worse comes to worst, for a week or two at a time. Even a water-privilege which, during ten months of the year, furnishes twice as much power as is needed, and even more, may be expected to fall off during one of the extraordinarily dry seasons, which occur at intervals of from five to ten years, to one-third its usual amount. In such a case an electric plant solely dependent upon water-power would find itself in a most undesirable predicament

In the present instance, the choice of a water-privilege finally reduced itself to two sites, one in the town itself, within half a mile of the center of consumption, and the other at Glendale village, seven miles distant, both situated on the Housatonic River. The privilege first mentioned being already occupied by a woollen factory, only the surplus water was available, but this was known to be quite sufficient for the requirements of the electric company at least nine months in each year, leaving three months to be run by steam. It had the advantage of being close at hand, and was capable of being fitted up at a moderate cost. As to the Glendale privilege, it was necessary to be very sure that the lowest water of a dry summer would give all the power required to run the plant without the aid of steam. Having invariably found the value of a water-power to be greatly exaggerated, not only in popular estimation, but in the opinion of its owners, the matter was investigated with much care. From the official State map of Massachusetts, it was ascertained that the area of the drainage basin of the Housatonic above the Glendale dam was 260 square miles. J. T. Fanning, a leading authority, from an extended examination of the recorded observations on the rainfall and flow of the New England rivers, reaches the conclusion that a water-shed of the area mentioned may be estimated to yield the quantities of water given below:

Cubic Feet of Water per Second per Square Mile.

Minimum (15 days of least summer flow)..........	0.25
Mean (120 days, usually July to Oct. inclusive)....	0.90
Maximum (flood volume)........................	93.00

It will be noticed that the flow in extreme dry weather is less than one-third of that which may be depended upon through the remainder of the year.

(To be continued.)

T.-H. FINANCING METHODS.

A COMMENTARY.

Bill of Complaint in the Suit of P. D. and J. O. Armour vs. New York Guaranty and Indemnity Company in the Tacoma Railway Case.

P. D. Armour, Jr., and J. O. Armour, who aver themselves to be citizens of the United States and the State of Illinois, bring this their petition and show to the court as follows:

1. The plaintiffs are stockholders in the Tacoma Railway and Motor Company, one of the defendants above named, same being a corporation organized and existing under the laws of the State of Washington, each of your petitioners owning in his own right 200 shares of the stock in the said company.

2. The complainant above named, with the New York Guaranty and Indemnity Company, a company existing under and by virtue of the laws of the State of New York, has caused the above entitled action in this court to foreclose a certain mortgage alleged to have been made by the Tacoma Railway and Motor Company to said complainant, as trustee, on all the property, rights and franchises of said Tacoma Railway and Motor Company, in the State of Washington, to secure a certain issue of bonds of said Tacoma Railway and Motor Company now outstanding and alleged in their bill of complaint in said action, to the amount of $1,350,000.

3. That this said mortgage and bonds which it secures were executed by the said Tacoma Railway and Motor Company, as petitioners are informed and believed and so allege, pursuant to an agreement entered into between a so-called syndicate, represented by one H. L. Achilles and E. N. Costello and said Tacoma Railway and Motor Company, the terms and conditions of which were as follows: The said Tacoma Railway and Motor Company was to create a mortgage of $1,500,000, and to issue bonds in a like sum, to be secured by said mortgage, said bonds to be 1,500 in number and of the denomination of $1,000 each; $25,000 of the face value of the said bonds were to remain in the treasury of said company for future use for extensions and betterments, to be issued as such betterments and extensions took place; $910,000 face value of said bonds to be delivered to the said syndicate at the rate of eighty-five cents on the dollar, said syndicate to receive in addition to said bonds a bonus of 910,000 shares of stock of said Tacoma Railway and Motor Company. As a condition sine qua non to the making of said agreement by said syndicate, the Tacoma Railway and Motor Company was to purchase the Tacoma and Steilacoom Railway at a price of $350,000, $300,000 payable in bonds of the Tacoma Railway and Motor Company and $50,000 in stock of said company. As a part of the purchase price of said company, it was agreed that all the property, rights and franchises, including real estate of the Tacoma and Steilacoom Railway, free from encumbrance, should be transferred to the Tacoma Railway and Motor Company, and that the Northwest Thomson-Houston Electric Company should replace, at its own cost, the present electric motors of the said Tacoma and Steilacoom Railway Company, with others of latest design, the capacity of such motors on each car to be jointly 50 horse power, and to nine cars then in use on said Tacoma and Steilacoom Railway new trucks, and to pay the cost of rebuilding the cars then in use on said road; also that the said Northwest Thomson-Houston Electric Company should build at its own cost and expense, as a part of said railway, a spur line from a point near the center of section 10 in Pierce County, Washington, to some point on Puget Sound, the length of said spur to be one and three quarter miles; also that the Northwest Thomson-Houston Electric Company should exchange the then three 80 horse power railway generators in use in said railway for one 370 horse power generator, the Tacoma Railway and Motor Company to pay the difference in cost, amounting to $2,767.00, also that the Northwest Thomson-Houston Electric Company should take back the present steam engine used by the Tacoma and Steilacoom Railway Company, and allow the Tacoma Railway and Motor Company $3,500.00 for same.

4. That all of the bonds represented by complainant in this action and secured by mortgage, now attempted to be foreclosed, were issued under and pursuant to the agreement hereinbefore set out, and were issued to the said Northwest Thomson-Houston Electric Company, and are now held and owned by said Northwest Thomson-Houston Electric Company, or to its successors or assigns, and as such are held by the successors and assigns of said company, are held by persons and corporations having full, complete notice of the infirmities attending the execution and issuing of said bonds and mortgages as hereinbefore set out.

5. That the said agreement and the bonds and mortgage issued, executed and delivered pursuant to it were and are fraudulent and void, and ineffective to charge to the said Tacoma Railway and Motor Company, because of the following facts:

(*a*) The agreement entered into with the so called syndicate was so entered into pursuant to fraudulent and corrupt conspiracy and agreement between one Paul Schulze, the then president of the Tacoma Railway and Motor Company, and the officers and agents of the said Northwest Thomson-Houston Electric Company for the benefit of the last named company, and to enable the last named company to acquire and negotiate bonds of said Tacoma Railway and Motor Company for much less than their nominal face value and much less than their actual value, and to secure the payment of same by mortgage of all property, rights and franchises of said Tacoma Railway and Motor Company. The said Paul Schulze, prior to the execution and delivery of said bonds and mortgages, acting corruptly and in collusion with the said Northwest Thomson-Houston Electric Company, falsely represented that said H. L. Achilles and E. N. Costello were agents and representatives of the syndicate to deal with the company and to furnish the moneys then needed by it, amounting to $600,000, when in truth and in fact the said Achilles and Costello were not agents or representatives of any syndicate, but were figureheads, not representing any one, but permitted the said Schulze to use their names as a friendly act to him, and the said dealings were wholly with said Paul Schulze himself, he being the sole and only representative of the syndicate and acting in that capacity as the agent of the Northwest Thomson-Houston Electric Company, all of which was unknown to the said Tacoma Railway and Motor Company, or its Board of Directors, except the said Schulze; and the said Schulze at the same time acted as the president of the Tacoma Railway and Motor Company and as one of its directors in the making of the contract with the said syndicate. The said Schulze further represented to the Board of Directors of the Tacoma Railway and Motor Company that its financial condition was desperate, and that the acceptance of the proposition of the said syndicate was necessary to save the said company from bankruptcy, and that the said proposition was fair and just, and advantageous to the company, and that the properties of the said Tacoma and Steilacoom Railway Company were worth the sum for which it was proposed to purchase the same; which said representations were false, in that the said deal was essential to save the said company from bankruptcy, but money could have been raised to save the company without the extraordinary sacrifices involved in the proposition of the so-called syndicate, and in that the properties of the Tacoma and Steilacoom Railway Company were not worth the sum of $350,000, or any sum in excess of $60,000; and the said proposition was not an advantageous one for the said Tacoma Railway and Motor Company, but in fact amounted to a sacrifice of the bonds of said company for about 50 cents on the dollar of their face value, and amounted to giving to the said Northwest Thomson-Houston Electric Company a bonus of the stock of the said Tacoma Railway and Motor Company to the amount of $141,000.

(*b*) That the debt created by the said agreement and by the execution and delivery of the said bonds and mortgage exceeded the indebtedness permitted by the by-laws of the said Tacoma Railway and Motor Company, in that said indebtedness was limited by said by-laws to $45,000 per mile of double track electric railway, to $30,000 per mile of single track electric railway, to $100,000 per mile of single track cable railway, to $150,000 per mile of double track cable railway, $10,000 per mile of single track horse or steam motor railway, $15,000 per mile of double track horse or steam motor railway, and that the mileage of said Tacoma Railway and Motor Company at that time was as follows: 1.6[illegible] miles single cable, 5.9[illegible] miles double track electric, 1[illegible].24 miles single track electric railway, and that the mileage of said company was increased by the purchase of said Tacoma and Steilacoom Railway property only to the extent of about twelve miles of single track electric railway, and the total indebtedness authorized and created by said lines under and by the by-laws was only the sum of $1,155,000. That the said by-laws and limitations therein and thereby placed upon the right of said Tacoma Railway and Motor Company to create an indebtedness was well known to said Northwest Thomson-Houston Electric Company and to its officers and agents at the time of entering into the said agreement and the execution and delivery of said mortgage and bond and the making of the mortgage.

(*c*) That under and by virtue of the Constitution of the State of Washington corporations organized under its laws and in said State are forbidden to issue any bonds or other obligations except for money or property received or labor done, and are forbidden to issue stock except to bona fide subscribers therefor or to their assigns, and all fictitious increase of stock or indebtedness is declared void. That under and by virtue of said agreement a fictitious issue of stock to the amount of $141,000 was made and the stock was delivered to the said Northwest Thomson-Houston Electric Company under and in pursuance of said agreement, and that the bonds of the Tacoma Railway and Motor Company, under and in pursuance of said agreement, to the amount of $1,2[illegible]0,000, were executed and delivered to the said Northwest Thomson-Houston Electric Company, and that the said Tacoma Railway and Motor Company received therefor money and property to about the value of $800,000. That the said transaction constituted a fraud on the Constitution of the State of Washington and the laws thereof, and the bonds and stocks issued pursuant thereto were and are absolutely void and of no effect and constitute no just or valid charge against the Tacoma Railway and Motor Company.

6. That the said Northwest Thomson-Houston Electric Company subsequent to the said transaction consolidated its organization and its property with the General Electric Company, a corporation, as your petitioners are informed and believe, organized under and by virtue of the laws of the State of Massachusetts, and the said bonds and stock are now held and owned by one or the other of said companies, but a portion of said bonds has been pledged by said companies as collateral security for a loan or loans of money made to them, but the holders of said collateral bonds have and are chargeable with notice of all the infirmities connected with their issue and delivery. That the bonds or stock delivered as heretofore alleged and by virtue of the same said companies had representation since the said issue on the Board of Directors of the Tacoma Railway and Motor Company, and the same constitutes a valid charge in favor of the said Tacoma Railway and Motor Company against the Northwest Thomson-Houston Electric Company and the General Electric Company for the face value of said stock, and the Tacoma Railway and Motor Company is entitled to an equitable offset to the amount of said bonds, to wit, $141,000, against a recovery on the bonds now held by said companies or either of them.

7. That neither the syndicate represented by the said H. L. Achilles and E. N. Costello, nor the said Northwest Thomson-Houston Electric Company, have complied with the terms and conditions of the said agreement concerning exchange of machinery, repairs of cars and building of additional track, and that the said Paul Schulze, fraudulently and collusively with the Northwest Thomson-Houston Electric Company, has undertaken to release them from the obligations to comply with the said terms and conditions and without requiring any consideration whatever from them to the Tacoma Railway and Motor Company for such release, and that the said action constitutes a fraud on the Tacoma Railway and Motor Company, perpetrated collusively between the said Paul Schulze and the Northwest Thomson-Houston Electric Company, and that the said Tacoma Railway and Motor Company has been damaged in the sum of $75,000 by failure to carry out the terms and conditions of said agreement as aforesaid, and that the said sum constitutes an equitable offset against any bonds held by said Northwest Thomson-Houston Electric Company or said General Electric Company.

8. That immediately after entering into the agreement with the so-called syndicate and the execution of said bonds and mortgage, 1,250 of said bonds, amounting to $1,250,000, were delivered and passed from the hands of the Tacoma Railway and Motor Company. That it was provided and agreed in the mortgage executed to secure said issue of bonds that the remaining 250 of the bonds, amounting to $250.000, should not be delivered out of its hands or the hands of its trustee except for paving or for building additional tracks and equipping the same, or for the purpose of additional equipment for the track already built, or for the purchase of additional rolling stock, or for making other extensions or additions to the property of the Tacoma Railway and Motor Company; yet petitioners allege that within one year thereafter an additional sum of $100.000 of said bonds was delivered to said Northwest Thomson-Houston Electric Company or its successor the General Electric Company, without any additional paving having been made, without any additional rolling stock having been bought, or any other extensions having been built or any additions having been made to the property of the said Tacoma Railway and Motor Company, all of which was well known to the corporations receiving the additional issue of bonds, and with the knowledge on the part of said corporations that the said issue was not only in violation of the terms of said mortgage securing the bonds, but was in violation of the by-laws of the Tacoma Railway and Motor Company; and petitioners now aver that the said bonds are now held by the said General Electric Company, and they aver on information and belief that the same were delivered without any consideration passing to the Tacoma Railway and Motor Company for them, but whatever consideration passed was passed to the said Paul Schulze as an individual, and all with the knowledge of said Northwest Thomson-Houston Electric Company and the General Electric Company.

9. Petitioners allege that by reason of the facts aforesaid the Tacoma Railway and Motor Company has an equitable offset against the said Northwest Thomson-Houston Electric Company and the General Electric Company and their successors and assigns with knowledge to the amount of $746,000, and that the amount due on said bonds ought in equity and good conscience to be reduced by said sum; and if the facts as aforesaid were properly pleaded in this action in this court and shown to this court by proof, said issue of bonds will be reduced by said sum of $746,000.

10. That all of said transactions took place without the knowledge or consent, or procurement, or acquiescence of your petitioners as stockholders in said company, and that it was only within the last few weeks that your petitioners became acquainted with the facts aforesaid and with the infirmities attendant upon the execution and delivery of said bonds and mortgages.

That your petitioners have applied to the Board of Directors of the Tacoma Railway and Motor Company and to the stockholders of the said Tacoma Railway and Motor Company at a meeting of the said stockholders to defend against the foreclosure of said mortgage and for the rendition of judgment upon the bonds aforesaid upon the grounds hereinbefore set forth, and have urged upon the board of said directors and said stockholders' meeting that they set up the facts aforesaid, both defensively and by cross bill, for the purpose of conserving the rights of said Tacoma Railway and Motor Company and its stockholders in the premises, but that both said board and said stockholders' meeting declined to do so except partially, to wit, to the extent of alleging that in making said deal with the so-called syndicate the said Schulze acted collusively with the said Northwest Thomson-Houston Electric Company; but your petitioners allege that whether it be true or not the said Schulze perpetrated a fraud upon the company in the respect aforenamed, and that the act of the said company in creating so large an indebtedness—larger than permitted by its by-laws—and in making an issue of its bonds and stock so largely fictitious, as herein alleged, constitutes a fraud upon the stockholders of said company, and one of which they have a right to complain in a court of equity, and that they have a right to set up in this action, for the purpose of invalidating the whole or in part, as the case may be, the mortgage executed by the said Tacoma Railway and Motor Company and the bonds which the said mortgage secures. And petitioners allege that the refusal of the said company to plead and prove the matters aforesaid constitutes a fraud in equity upon the said stockholders of said company and gives them an equitable right to appear in this action as partners defendant, and allege each and every and all of said defence.

Therefore your petitioners now come and move the court for an order admitting them into court in these causes as partners defendant with leave to plead or answer to the bill of complaint and the facts as herein set forth by way of defence or cross bill as they may be advised, and such other and additional facts as may appear against the right of the complainants in this action to the relief sought, and as in duty bound they will ever pray.

TURNER, GRAVES & WOLF,
Solicitors and Petitioners,
Spokane, Wash.

General News.

What is Going on in the Electrical World.

Beaumont Tex.—The project of building an electric railway in this town is being seriously considered by some of the leading business men.

New York.—Amos J. Cummings has been removed from the Subway Commission and Thomas L. Hamilton appointed in his stead.

Helena, Mont.—The Capital Electric Lighting Company, which has the contract for lighting the city, is putting in a complete new plant.

Cleveland, O.—A preliminary survey is being made of the route for the proposed electric road from Cleveland to Medina, a distance of thirty miles.

Hibbing, Minn.—An electric light plant, to be managed in connection with the water plant, is one of the improvements contemplated by the authorities of this village.

Petersburg, Va.—John C. Robertson, representing Northern capitalists, has applied for a franchise to build an electric road between Manchester and this city.

Hastings, Neb.—The Hastings electric light plant has been sold under foreclosure of a mortgage of $13,000 held by Adam Cook, Jr., of New York. The plant was bought in by Mr. Cook for $10,000.

Saratoga, Wyo.—An electric railway is projected between this city and Wolcott Station, on the line of the Union Pacific Railway, a distance of twenty-two miles. A roadway has been graded for part of the distance.

Kokomo, Ind.—Messrs. Snow & Avery, of this city, who have a franchise for the construction of an electric railway from here to Greentown (10 miles), are receiving bids for grading and tracking and will award the contract August 1.

Dowagiac, Mich.—The Round Oak Stove Works at Dowagiac have discarded steam as a motive power and substituted electricity, conveyed by wire from La Grange, five miles distant, the generators being driven by water power.

Lexington, Mo.—At the recent special election there was an overwhelming vote cast in favor of an electric light plant, and when the result was known the people were wild with enthusiasm. There were bonfires, fireworks and music by the band.

Atlantic City, N. J.—The Brigantine Beach Railroad has been sold under foreclosure proceedings to George H. Cook, acting for the Holland Trust Company of New York. It is reported that the road will be changed to an electric trolley line.

Nyack, N. Y.—The Nyack Traction Company, of which F. R. Bain, of Poughkeepsie, is president, and Congressman B. B. Odell, of Newburg, a director, will begin the construction of an electric railway between Nyack and West Nyack in a few days.

Berlin, Conn.—It is thought probable here that the Middletown and New Britain branches of the Consolidated road to this junction will be equipped with electricity as a result of the tests of substituting electricity for steam on the Nantasket Beach branch of the road.

Independence, Mo.—The city council has granted a franchise to Walton H. Holmes and others for an electric street car line in the most important thoroughfare in the city. Mr. Holmes is identified with the Kansas City and Independence Rapid Transit Railroad.

Guntersville, Ala.—A company of Boston men who are putting in a plant at Columbus City, Marshall County, for the manufacture of electric appliances, have on foot now a scheme to build a single track elevated electric railway from Guntersville to Scottsboro.

Seneca Falls, N. Y.—An electric road connecting Seneca Falls and Romulus is being quietly agitated, to tap the Lehigh at the latter point. The proposed route lies in a beautiful, thickly populated section of Seneca County, and its advocates believe it will be a paying investment.

Mellette, S. Dak.—The firm of W. B. Potter & Company, owning mills at Mellette, Beresford and Wakanda, and electric light plants at Mellette and Beresford, has been dissolved by mutual consent. It is succeeded by the Northern Waterworks and Power Company, a corporation recently organized under the State laws.

Greensburg, Ind.—Local capitalists are canvassing the advisability of building an electric railroad between Greensburg and Clarksville, twelve miles from here, by way of Kingston. B. S. Sutton and K. M. Hord, of Shelbyville, and others interested in the Oldenberg and Batesville electric road, are the promoters of the enterprise.

Chicago.—The Ferris wheel has been moved to a permanent location on North Clark street, where grounds have been purchased for a pleasure resort. An electric fountain larger than any hitherto seen in Chicago will be one of the attractions. The grounds will be illuminated by 100 arc and 400 incandescent lamps.

Rondout, N. Y.—The Rondout and Eddyville Railway Company has made application to the commissioner of highways of the town of Ulster, Ulster County, N. Y., for permission to construct and operate a street surface railway, to be operated by either horse-power or electricity, beginning in Rondout and extending to Eddyville.

Mexico City, Mex.—It is rumored that a concession has been granted to a French company with a capital of 20,000,000 francs to introduce electric force into this city. The company expects to furnish 20,000 horse-power, taken from waterfalls in the State of Puebla, 125 miles distant. A German electrical concern is also developing plans for supplying electrical energy to this city.

Humboldt, Tenn.—Several prominent and wealthy citizens of Alamo, the county seat of Crockett County, are organizing a stock company for the purpose of building an electric railroad from Alamo, via Gibson Wells, to Humboldt. The line will be about eighteen miles in length and will pass through the richest farming lands in the State. The power plant will be located at Humboldt.

Williamstown, Md.—The town council has granted a franchise to Powell Evans to erect poles and wires in this town for lighting and power purposes in connection with his scheme for transmitting electricity generated at a plant to be established at dam No. 4 or 5 on the Potomac River. Several mills and other industries here propose to receive motive power from the electric line.

Batesville, Ind.—The town council has granted right of way to the Batesville and Oldenburg Railroad Company and the road between Batesville and Oldenburg will now be pushed to completion as rapidly as possible, after which it will be extended to Osgood, sixteen miles south, thus connecting the Baltimore and Ohio and Big Four railroads. Later on the road will be extended to Brookville. The gentlemen interested are capitalists of Shelbyville and Batesville, B. S. Sutton being president of the company.

Middletown, N. Y.—The Middletown-Goshen Traction Company and the Middletown-Bloomingdale Electric Railway Company have been consolidated under the title of the first-named company. The roads form a continuous line. The capital stock of the new corporation is $400,000 and the directors are James C. Hinchliffe, of Paterson, N. J.; Benj. H. Throop, William B. Rockwell and M. J. Wightman, of Scranton, Pa.; Charles H. Smith and William B Bryce, of Middletown, and William S. Grant, Jr., Philadelphia, Pa.

Ottawa, Can.—A bill to incorporate the International Railway Company, which proposes to construct and operate electric railways in Western Ontario, with Hamilton as a central point, has passed the railway committee of the House. The bill empowers the company to bond the road to the extent of $20,000 per mile of single line and $6,000 per mile additional for double track, and also authorizes it to lease the railway to the Canadian Pacific, Canada Southern or New York Central, and to acquire the franchises and properties of electric lines now in operation.

Elkton, Md.—Preparations are being made for building the dams on the Susquehanna River at Conowingo, where the Susquehanna River Electric Company proposes to establish a great electric plant. The fall of water obtainable at that point is sufficient to produce several thousand horse power, which it is proposed to transmit by means of electricity to Baltimore and other places. The Electric Company is in possession of undisputed water right and land on each side of the river and can utilize them in the distribution of buildings, piers, and whatever constructions are necessary.

Philadelphia.—All the assets of the Electrical Accumulator Company were sold in this city under foreclosure proceedings on the 27th ult. Most of the assets were bid in by L. F. Potts. The sale wound up the affairs of the Accumulator Company, which was incorporated in New Jersey five years ago with a capital of $5,000,000, full paid, for the purpose of manufacturing accumulators and electrical storage batteries. The plant of the company is situated at Newark, N. J. The company became financially embarrassed some time ago and was reorganized, but the reorganization was not effectual.

Newark, N. J.—It is stated that a company will be incorporated in a few days to carry on the manufacture of an apparatus for lighting railroad cars by electricity. The apparatus was invented and patented by Charles Wachtel, of the Wachtel Electrical Company of Newark. The device consists of two storage batteries for each car which will not in any way be connected with each other. Electricity will be generated by the revolution of the wheels in whichever way they are going—backward or forward. Everything works automatically, and when the batteries are fully charged the connection with the wheels ceases. The whole will be operated by a button switch and each car is lighted separately.

Washington, D. C.—At a recent meeting of the Washington and Great Falls Electric Railway shareholders the offer of Stilson Hutchins to purchase the $100,000 6 per cent. gold bond issue, part of the $500,000 issue authorized, was accepted. The following directors were elected: J. P. Clark, S. T. G. Morsell, C. A. Maxwell. J. V. N. Huyck, Smith Pettit, F. H. Stier and W. E. Lewis. These elected J. P. Clark president, S. T. G. Morsell vice-president, Lee Hutchins treasurer and W. E. Lewis secretary. The contract for the construction of the road will be let and work commenced at once.—The various companies interested in plans to build an electric road from Washington to Baltimore have combined their interests under the title of the Columbia and Maryland Railway Company, which includes the Eckington and Soldiers' Home system in Washington, forming the Washington end; the Baltimore and Washington Turnpike Company and the Edmondson Avenue, Catonsville and Ellicott City Company, which forms the Baltimore end of the system. The officers of the Columbia and Maryland Company are as follows: President, Thomas M. Lanahan; vice-president, B. N. Baker; treasurer, Ernest McElroy; secretary, R. Stanley Carswell; general manager, W. Kelsey Schoepf. The capital stock is to be $4,000,000, and the limit of bonds authorized to be issued is $6,000,000.—Strenuous efforts will be made in the next Congress to induce the Government to appropriate enough money to establish an electric plant at the Great Falls of the Potomac on lines similar to but less extensive than those in use at Niagara Falls. The prime mover in this project is Col. Elliott of the Corps of Engineers, lately retired, who declared that for $750,000 a plant could be put in which would supply enough electricity for the uses of the Government in Washington to more than make up its entire cost in one year.

Telephone and Telegraph.

S. B. Kinard intends to construct a telephone system at Jackson, Ga.

The Postal Telegraph Company expects to have its lines into Decatur, Ill., in about three weeks.

A new telephone company, incorporated by Geo. J. K. Phillips, Thomas Moore, Representative Moore of Bethel, A. J. Horsey and J. D. Marvil, will establish a line at Sharpstown, Md.

Wm. C. Muncell has been granted an exclusive franchise for five years to operate a telephone line connecting Crede, Col., with the various mines in Mineral County.

John Dunfee, Frank H. Hiscock and associates, who purpose establishing a branch of the Mutual Automatic Telephone Company in Rochester, have applied to the city council for a franchise.

A movement is on foot at Gorham, N. Y., to establish another telephone system in that section.

The New York and Philadelphia Telephone and Telegraph Company has applied to the common council of Trenton, N. J., for permission to erect poles and wires in that city.

The Little Rock and Home Mutual telephone companies have applied to the city council of Little Rock, Ark., for franchises. The Southwestern Company (a Bell concern) is actively opposing the application.

The Phœnix Telephone Company has made propositions to the Board of Works of Indianapolis for a franchise to establish its system in that city which are so favorable to the city that their acceptance seems probable.

Two new companies have applied for telephone franchises in Syracuse—the Automatic Telephone Company and the Palmer Telephone Company, of which A. W. and M. C. Palmer are the projectors. The council, it is said, looks with most favor on the petition of the Automatic Company.

The New Orleans Telephone Company has been granted a franchise for that city and is actively engaged in getting subscriptions. It has already a large number of subscribers on its list and is making inroads on the patronage of the Bell Company.

The United States Telephone Construction Company opened their rooms in the Bullitt Building, Philadelphia, on Wednesday last, for the purpose of affording the public an opportunity of inspecting their new "M and B" telephone and the Gould-Smith switchboard. A large number of visitors witnessed the working of the instruments and apparatus, and were favorably impressed by the simplicity, convenience and efficiency manifested in their operation. Experts pronounced the system superior to the Bell in several important respects.

The stockholders of the Montauk, Orient and New York Telegraph and Telephone Company met at Cutchogue, L. I., on Thursday last, and by a majority vote decided to sell out to the New York and New Jersey Telephone Company (Bell). The Montauk Company was formed to compete with the other in the telephone business of a large section of Long Island.

At Oskaloosa, Iowa, the superintendent of the Iowa Telephone Company (Bell) went quietly among his subscribers a few days ago and informed them that his telephone service would be free until further orders, but it was too late as most of the subscribers had signed contracts with a new company which was to open an exchange July 1.

Among the incorporators of the Home Telephone Company of Sioux City, Iowa, are P. H. Johnson, A. H. Hazen, A. F. Pall and F. W. Lohr.

The Central District and Printing Telephone Company, which operates the telephone lines centering in Pittsburg, has commenced the construction of a new line between Pittsburg and Washington, by way of Chartiers Valley.

The city council of Trinidad, Col., has granted a franchise to a new telephone company composed of citizens and business men of the city, who will establish and operate a separate system of telephones over the city in opposition to the Bell or Colorado Telephone Company.

The Commercial Telephone Company is introducing a new telephone service into Oakland, Cal., in opposition to the Sunset, and has already over 300 contracts. It proposes ultimately to cover the entire county. It is managed by Oakland and San Francisco business men. Ernest R. Smith, general manager of the Commercial Company for Alameda County, has been in consultation lately with the directors of the Capital Telephone Company at Sacramento in reference to forming connections with that company and city.

The Automatic Telephone and Electric Company of Illinois, licensee for the Strowger Automatic Telephone Exchange, Chicago, report having closed contracts and are now installing an exchange of 5 0 subscribers at Bloomington, Ill. The construction is being pushed vigorously, and it is expected that the plant, with 350 subscribers, will be in operation by the 1st of August. The same company also report the Automatic exchanges at Laporte and Michigan City, Ind.; La Grange, Ill.; Ypsilanti, Mich.; Albert Lea, Minn.; Perry, N. Y., and in fact all exchanges operating under this system, as giving perfect satisfaction.

The Harrison Telephone Company has been organized at Detroit, Mich., with the following incorporators: O. W. Shipman, C. P. Collins, R. A. Brett, Albert Pack, C. B. Hubbard, W. L. Holmes and Charles Flowers. The directors' board comprise the same gentlemen. The capital stock of the company is $600,000 and 4,500 telephones have been subscribed for. The articles of incorporation will be filed at once as the common council has granted the company a thirty-year franchise which will probably be accepted.

The *Times Herald* of Chicago is entitled to the honor of having first used the telautograph in furnishing press dispatches. That paper on the 20th ult. published photographic fac-similes of a number of messages in the identical handwriting of the author, sent to it that night from prominent men who were in attendance at the Republican League Convention at Cleveland. The test, says a prominent electrician, "was a most successful one. The instrument worked perfectly over a circuit 430 miles long. The ordinary telegraph circuit is only about 500 or 600 miles, automatic repeaters being used where the distance is greater. No repeaters were used in the *Times-Herald* test between Cleveland and Chicago, and the work of the instrument was a surprise, even to those connected with it. The longest trial heretofore given the telautograph was between Paris and London, the test being a private one." When Prof. Gray first conceived the idea of the telautograph, it is said, he had no idea of ever using it for long-distance work.

A dispatch from Webster City, Iowa, states that "that section of the State is being honeycombed with cheap telephones since the demise of the Bell Telephone Company. Lines are now in course of construction from Clear Lake west through Garner, Britt, Algona, Emmettsburg and Spencer on the Chicago, Milwaukee and St. Paul Railroad. From Britt they will work north and south, going north to Albert Lea and south to Humboldt. They make connections at Clear Lake and Humboldt with the Iowa Union lines, and will thus put Humboldt within the reach of nearly every important town in the State by telephone."

Siemens & Halske in the Northwest.

The Electrical Engineering Company of Minneapolis has taken the Northwestern agency of the Siemens & Halske Company, and will, no doubt, handle the business with their accustomed vim and energy.

"American" Incandescent Lamps.

Mr. A. L. Reinmann, formerly superintendent of the Sawyer-Man Electric Company, has accepted a similar position with the American Electrical Manufacturing Company, St. Louis, and has already entered upon his duties. Mr. Reinmann is well and favorably known as one of the best incandescent lamp makers in the country, and the addition of his methods and recent improvements to those of the American Company, which have a most enviable reputation, ought to and doubtless will, produce incandescent lamps of exceptionally high grade. The American Company takes great pride in the quality of its output, sparing no efforts or expense, and the engagement of Mr. Reinmann is in line with its determination to produce the best.

A Canadian Lamp Test.

For some months past Charles F. Stilwell has been engaged in testing all the prominent lamps manufactured in the United States as well as in Europe for the benefit of Stilwell & Company of Hamilton, Ontario. Mr. Stilwell was well fitted for this work, as he has been prominently identified with the history of the art since Menlo Park days, and established the Edison Canadian factory, remaining as manager for the Canadian General Electric lamp factory until quite recently.

His test of efficiency, sustained brilliancy and life resulted in the selection of the Imperial Incandescent Lamp, in which choice the manufacturer, the Bryan-Marsh Company, take excusable pride, especially since their lamps were not furnished by Messrs. Stilwell & Co. direct but were procured without the knowledge of the makers through a Canadian customer, thus showing the results with an average product as against carefully selected lamps of some competitors.

Messrs. Stilwell & Co., as a consequence of their investigation, will hereafter handle the Imperial Incandescent Lamp in Canada, and it may be gratifying to the trade in general to know that they did not desire a cheap lamp, contending that the future demand would be for a good lamp, in which the first consideration was great care in the manufacture, even if the first cost was thereby somewhat enhanced.

BUSINESS HINTS.

Public Buildings, Theaters, Residences, &c., Proposed or in Course of Construction.

[The following summary is prepared weekly for ELECTRICITY for the information of advertisers and readers who are dealers in apparatus and articles required in the electrical equipment of public and private buildings.]

Albany, N. Y.—L. G. Perry, architect, will furnish plans and forms of proposals for the wiring of the State Armory buildings in this city. Proposals may be sent by mail to or delivered in person, up to noon July 8, at the office of the Adjutant-General.

Atlantic City, N. J.—The city council has passed an ordinance providing for the erection of a city hall, to cost $ 00,000.

Baltimore, Md.—The George Bauernschmidt Brewing Company will probably erect a large modern saloon and restaurant, cor. Holliday and Fayette sts.

Belvidere, N. J.—The trustees of the First Presbyterian Church are considering the question of lighting the edifice by electricity.

Boston, Mass.—H. Reed Whipple, the well-known hotel man, has plans for a ten story hotel building on the block bounded by Tremont, Boylston, Tanworth and La Grange sts.; estimated cost $1,000,000.

Brooklyn, N. Y.—W. H. Reynolds will erect a four story brick flat, north side of Park Place, west of Washington ave.

Deckertown, N. J.—The Newburgh Electric Railroad Company has bought Pine Point at Orange Lake, and will erect a $10,000 hotel building there.

Depew, N. Y.—Plans have been prepared for a manufacturing building here, in which 700 or 800 men will be employed. Mr. Kingsley, president of the Real Estate Exchange, Buffalo, can probably give information.

Elizabeth, Pa.—The parsonage to be erected for the M. E. Church will be wired for electric lighting.

Fall River, Mass.—Preparations have been completed for the erection of a new hall for the Y. M. I. A. Society.

Goshen, Ind.—Architect M. L. Smith & Sons, 75 Home Bank Building, Detroit, have prepared plans for the remodelling and enlarging of opera house in Goshen. Electric lighting, opera chairs, etc.

Jersey City, N. J.—The Hudson County Republican County Committee has decided to erect a club house on Pavonia ave., near the Five Corners Plans for the structure have been approved.

New Bedford, Mass.—Nat C. Smith has just completed plans for an elegant dwelling house, to be erected for F. P. Hawley, to be located northwest cor. of County and Willis sts.

New Orleans, La.—A. Canter has prepared plans for a store and residence to have electric lighting and steam heating; also for a dwelling for H. Pitard, to have incandescent lighting, etc.... Mazureau Raynes has prepared plans for residence for E. Howard M. Caleb, to have incandescent lighting.

New York City.—Boehm & Coon, the builders, who now have in course of construction at Washington Square and Washington Place a seven story fire-proof store and loft building, are making preparations to build a similar structure on the plot adjoining the Washington Place front. The new structure will contain modern equipments, including electric wiring and apparatus.... John Kehoe, the builder, will erect a seven story store and loft building on northeast cor. of Broome and Wooster sts.

INCORPORATIONS.

The Southern Electric Construction Company, Richmond, Va.—to construct and equip telephone plants and exchanges, electric light plants, and do a general electric business. Capital stock, $25,000. President, J. M. Cullingworth; vice-president, C. E. Wingo; secretary and treasurer, G. S. Maxwell.

The Hamburg and Portland Telephone Company, Hamburg, Ark.—to construct a line from Hamburg to Portland, a distance of 35 miles. Capital stock, $8,000. Incorporators: J. D. Pugh, Charles M. Woodward, J. H. Pryor, T. R. Pugh and T. B. Savage.

The Badts Multiphase Electric Railway Company, Chicago, Ill.—to promote, build, buy and sell electric railways, and manufacture, buy and lease supplies, apparatus and patent rights therefor. Capital stock, $1,000,000. Promoters: Wm. A. Aylsworth, Jas. C. Essick, Adolph Gray.

The Sheboygan Light, Power and Railway Company, Sheboygan, Wis.—to deal in light and power and operate an electric railway. Capital stock, $200,000 Promoters: George B. Matten, J. M. Saemann, F. L. Saemann, Sheboygan.

The Wall Street Electric News Agency of New York City—to collect and distribute commercial, financial and other news and conduct publications, and to transmit and collect news by machines. Capital stock, $50,000. Directors: F. W. Keutgen, R. J. Welsh and O. B. Goldsmith, of Brooklyn.

The Huntington Improvement Company, Huntington, Ore.—to deal in real estate, lumber, live stock, general merchandise, acquire water works, electric light and power plants, mills, grain elevators, railroad bridges, flumes, and to do a general brokerage business. Capital stock, $20,000, with privilege of increasing to $100,000. Incorporators: Robert M. Steel, John Aiken and Fred. Williams.

The Cascade Electric Light and Power Company, Cascade, Dubuque County, Iowa—to erect a plant for furnishing electric light and power. Capital stock, $7,000. Incorporators: D. M. Finley, L. P. Freeman, J. A. Hayes, H. L. Denner, J. W. Betty.

The Mt. Winans, Westport, Lansdowne and Meeter's Park Railway, connecting those places by an electric railway with Baltimore, Md., has been incorporated. Capital stock, $75,000. Incorporators: Dr. Wm. H. Crim, S. J. Carr, of the Carr-Lowery Glass Company; Wm. F. Porter, of Johns & Porter; Brosius Reed, George S. Kiefer and George A. Meeter, all of Baltimore.

The Idaho Springs and Bellevue Mountain Tramway Company, Idaho Springs, Col.—to build and operate an electric railway. Capital stock, $60,000. Incorporators: James W. Swem, Milo H. Slater, James A. McClurg and Ed. Lachner.

The Bullard Electric Company, Chicago—to manufacture electric apparatus. Capital stock, $25,000. Incorporators: Charles W. Bullard, Aubert S. Bullard and Carl E. Kammeyer.

The Albany District Telegraph Company, Albany, N. Y.—to construct and maintain telephone and telegraph lines in Rensselær and Albany counties. Capital stock, $20,000. Directors: Selden E. Marvin, D. Cady Herrick, James H. Manning, Henry E. Hawley, Frederick W. Newman, William F. Wieser and John J. Wieser. The new corporation is the result of the consolidation of the American District and Capital District Messenger services.

The Ladoga Electric Light and Power Company, Ladoga, Ind. Capital stock, $9,000. Promoters: S. F. Kyle, H. E. Daugherty, Wm. M. Rhods.

The Centerville Light, Heat and Power Company, Centerville, Ia.—to furnish gas, electric light, heat and power. Capital stock, $65,000. Promoters: D. C. Campbell, W. G. Clark, Jas. R. Wooden, W. M. Peatman, C. P. Campbell, Centerville, Ia.

The Pittsburg, Arlington Heights and St. Clair Street Railway Company, Pittsburg, Pa.—to build an electric street railway. Capital stock, $21,000. Promoters: C. E. Owens, Patrick Ridge, Michael Ridge, Pittsburg.

The Electric Protection Company, Dallas, Tex.—to manufacture and sell electrical or other devices for protection from unlawful intrusion of vaults, safes, etc. Capital stock, $50,000. Promoters: Chas. Goldstein, Henry Hirsch, W. H. Garritson, all of Dallas.

The C. J. Field Company, New York—to conduct an electrical and mechanical consulting and engineering business. Capital stock, $4,000. Directors: Cornelius J. Field, of Brooklyn; Frank Bourne, of Mount Vernon, and John W. Gilmore, of New York City.

MOONLIGHT SCHEDULE FOR THE UNITED STATES.

(Issued by the Washington Carbon Company.)

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JUNE 25, 1895.

ELECTRIC RAILWAYS AND APPLIANCES.

541,730. Conduit Electric Railway. Edward Ebl, Cedar Rapids, Iowa. Filed July 5, 1894.

541,796. Trolley-Finder. James P. Taylor, Fort Worth, Tex. Filed March 12, 1895.

ELECTRIC LIGHTS AND APPLIANCES.

541,460. Electric-Arc Lamp. Albert W. Smith, Washington, D. C. Filed April 25, 1895.

541,491. Repairing Incandescent Lamps. Joseph Mohrle, Munich, Germany. Filed Jan. 25, 1895.

541,541. Carbon Electrode for Electric-Arc Lamps. Salomon Heimann, New York, N. Y., assignor to Leopold Katzenstein, same place. Filed Oct. 5, 1894.

541,603. Electric-Arc Light. Edgar A. Edwards, Cincinnati, Ohio. Filed Sept. 19, 1894.

DYNAMO ELECTRIC MACHINERY.

541,500. Electrical Controller for Motors. Oscar H. Pieper and Alphonse F. Pieper, San Jose, Cal. Filed April 30, 1894.

541,542. Automatic-Working Rheostat for Starting Electric Motors. Frank E. Herdman, Winnetka, Ill. Filed Nov. 24, 1894.

541,543. Automatic-Working Rheostat for Starting Electric Motors. Frank E. Herdman, Winnetka, Ill. Filed Nov. 24, 1894.

541,5[illegible]. Electric Motor. Frank E. Herdman, Winnetka, Ill. Filed Nov. 27, 1894.

541,5[illegible]5. Electric Brake-Controller. Frank E. Herdman, Winnetka, Ill. Filed Dec. 18, 1894.

541,604. Alternating-Current Motor. Rudolf Eickemeyer, Yonkers, N. Y. Filed Sept. 23, 1891.

541,615. Transmission of Power by Alternating Currents. Fred. S. Hunting, Fort Wayne, Ind. Filed Jan. 19, 1895.

541,641. Electric Motor. William J. Still, Toronto, Canada, assignor to Charles Riordon, same place. Filed Aug. 9, 1894.

541,798. Device for Removing Resistances in Starting Electric Elevators. George H. Whittingham, Baltimore, Md., assignor to the Automatic Switch Company of Baltimore City, of Maryland. Filed May 24, 1894. Renewed Feb. 18, 1895.

MISCELLANEOUS.

541,459. Combined Insulator and Fuse-Holder. Charles F. Scott and Harry P. Davis, Pittsburg, Pa., assignors to the Westinghouse Electric and Manufacturing Company, same place. Filed July 16, 1894.

541,465. Electrolytical Process and Apparatus. Claude T. J. Vautin, London, England. Filed June 26, 1894.

541,467. Method of Preventing Electrolysis of Pipes Under Ground. Harold P. Brown, New York, N. Y. Filed Dec. 10, 1894.

541,471. Electromagnet. Fred B. Corey, Boston, Mass. Filed April 15, 1895.

541,497. Electric-Elevator Apparatus. Francis B. Perkins, Boston, Mass., assignor to the National Company, Chicago, Ill. Filed Dec. 15, 1892.

541,50 . Code Signaling Device. William Rymer, Detroit, Mich. Filed July 2, 1894.

541,549. Automatic Electric Gas-Lighter. William N. Jaskey and Edward S. Else, Logan, Utah. Filed Aug. 20, 1894.

541,552. Protector-Casing for Underground Electric Conductors. John A. Kingdon, London, England. Filed Aug. 9, 1894.

54 ,608. Electric Switch. William P. Hancock, Everett, Mass. Filed Feb. 7, 1895.

541,719. Burglar-Alarm. Charles M. Clark, New York, N. Y. Filed April 12, 1895.

54 ,723. Electric Gas-Lighter. John L. Creveling, New York, N. Y. Filed Jan. 21, 1895.

541,724. Thermo-Controlled Electrical Heater. Levitt E. Coster, Dayton, Ohio. Filed Dec. 22, 1894.

DESIGN.

24,427. Casing for Electric Controllers. Jonathan P. B. Fiske, Alliance, Ohio. Filed Jan. 10, 1895. Term of patent 7 years.

ELECTRICITY.

VOL. VIII. NEW YORK, JULY 10, 1895. No. 26

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER CO.
B. E. GREENE, PRES'T. L. J. MONTGOMERY, SEC'Y.

PUBLICATION OFFICE:
6 Park Place - New York

EDITORS: NELSON W. PERRY.
BURTON E. GREENE.
R. H. WILLOUGHBY.

BUSINESS MANAGER, - - JOHN L. GANS.

SUBSCRIPTION RATES:

UNITED STATES,	$2.50
IN CLUBS OF FIVE OR MORE,	$2.00
FOREIGN COUNTRIES,	$4.50
SINGLE COPIES,	10 CENTS

ADVERTISING RATES:
As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.
Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

ENTERED AT THE N. Y. POST OFFICE AS MAIL MATTER OF THE SECOND-CLASS.

TRADE SUPPLIED BY
THE AMERICAN NEWS COMPANY,
THE WESTERN NEWS COMPANY,
And their Agencies in all Principal Cities.

EDITORIAL NOTES.

Electric Power in Factories and Mills. The paper of Messrs. Crocker, Benedikt and Ormsbee on this subject, the first portion of which we published last week, has an extreme educational value in this, that there is therein tabulated the results of actual practice, apparently very carefully worked out and presented in a form convenient for reference. Such a paper is of no less value to the practising engineer than to the manufacturer who is contemplating the equipment of a new factory, for the figures given will serve as a precedent upon which to base future economies in similar and allied installations. We well remember how, in the earlier days, before such economies had been demonstrated, and when actual figures were scarcely attainable, with what incredulity even conservative estimates of the economies that would result from a substitution of electric motors for systems of belts, shaftings and pulleys was received. The writer was called upon in 1890 to make such a report for a very large industrial establishment in the West. This establishment covered several acres of ground and comprised some half dozen separate buildings to which power was delivered. There was a somewhat centrally located steam generating plant from which steam was carried in underground conduits to separate steam engines in the different buildings, and from them the power was distributed by long lines of shafting and belting to the different machines in the same building, and in some cases to machines in the smaller outlying buildings. There were two lines of shafting, exceeding 300 feet in length each, and numerous others of shorter length, and much of the heaviest work was of an intermittent character. The conditions favorable to the substitution of electricity were very pronounced, but our duty was to give the probable economies a numerical value.

A careful determination of the condensation losses in the steam transmission, the indication of the engines, an approximate determination of the belt and shafting losses, and a consideration of the effect of the intermittent character of the various loads, together with a reference to the company's books as to the actual cost of its then service, led us to believe that with the proposed substitution the operating expenses of the whole establishment chargeable to power account would be reduced by 30 per cent. According to our most careful calculations there was still a considerable margin of safety, and we felt fully justified in making this report. Although subsequent events have fully demonstrated the conservatism of our report, it is noteworthy that one of our largest manufacturers of electrical machinery, although they sent one of their own experts to verify our report, refused to guarantee any economy and lost the contract simply because of the absence of such data at that time as are presented in the paper under review. This company *believed* that our report was conservative, but lacked the courage of their convictions which such experimental data as we now have would have supplied.

A better knowledge of the actual power consumed by a tool such as is here given, and an appreciation of the effect of intermittence of action of the various machines upon the load factor of the establishment, will doubtless conduce to the much wider introduction of the electric motor than it has hitherto enjoyed. An appreciation of these facts, too, may lead to more satisfactory arrangements with central power stations by which both the producer and user of power may be ultimately benefited.

It is a noteworthy fact that most of those using power even in considerable quantities have a very exaggerated idea of the amount they are actually using. We know of power companies in the West that are making money, and benefiting their customers too, by undertaking to operate by electrical means, for a lump sum less than the proprietors have been operating them for, the establishments which they seek as customers. The method of doing business is something like this: An agent who appreciates the facts brought out in the paper under review goes to an establishment and looks it carefully over. From his knowledge of machinery he knows that if everything is put in good order 100 H. P. on an average will operate the whole shop. He finds a maze of belts and line shafting, the latter perhaps out of true. The engine, a 200 H. P. unit, itself perhaps out of alignment and rickety, is barely able at full load to turn a wheel. He asks the proprietor what power he requires to run his establishment, and is answered that 200 H. P. is barely enough, and it costs him, he says, $100 per H. P. or $20,000 per year for power to run it. The agent then makes a proposition something like this: "If you will put your machinery in order, or let me do it for you at your expense, I will supply you 200 H. P., or enough to run your establishment, for $75 per H. P." The proposition is accepted, and both the power company and the customer are benefited—the customer, because he gets the same net power for $15,000 that formerly cost him $20,000, and the power company because it gets $15,000 for what the establishment really needs, which seldom exceeds 100 H. P.

The figures here given may illustrate an exaggerated case, but the principle will hold good in many cases, especially where smaller units are employed, and we believe that herein is indicated a profitable course to pursue for our central lighting stations who desire to keep their machinery profitably employed during the daylight hours. The present method of charging for power at lighting meter rates is almost prohibitory. If half an ampere hour is charged for at 1 cent, a H. P. hour costs 18 cents. For 8 hours a day and 300 days the bill would be over $300 per year per H. P. Even those using very small units can generate power locally by steam at but a fraction of this, and only those who do not care to go to the expense and trouble of installing a steam or gas engine become purchasers at all. But among these smaller users of power doubtless there are few who can generate it at less than $100 per annum. Would it not be policy for the central station man, after looking over such establishments, to offer to supply them for a stipulated sum based upon what it has previously cost the establishment to produce it locally? In many cases contracts could doubtless be made at a lower price than it could be locally generated for, on the condition that the power supply should be cut off during the hours of maximum lighting load.

We believe that some such plan might prove highly beneficial, both to the producer and the consumer, and is well worth trying at any rate.

* * *

The Print You Stole, oh Stevie Cole. *Electric Power*, through the personality of its staff, Messrs. Foster, Osterburgh and Davis, concocted and carried out a most brilliant scheme at Niagara by which it was hoped to add materially to its already large list of subscribers. This scheme was to have a large group picture taken of the members of the Institute present on this memorable occasion, and to offer copies of it as a premium for new subscribers. The whole thing was done at its own expense. The picture was unusually good, many new subscribers were obtained on the spot with cash down, and the negative brought to New York on Friday night for printing. But Mr. Coles left Niagara the day before, and in the next issue of the *Review* there appeared a half-tone reproduction of this same picture—some days in advance of the issuance by *Electric Power* of its own copies. Messrs. Foster, Osterburgh and Davis regard this anticipation as ——, and they are too full for utterance. "Electricus," however, comes to their assistance in a pretty but reproachful poem which appears in another column.

* * *

Financiering or Swindling? There appeared in last Sunday's *Mercury* a page or so of interesting matter in regard to the General Electric Company, accompanied by a cartoon which, while conceived in a fine sense of humor, will not be considered funny by the widows and orphans and small shopkeepers of New England who have lost their little all by investing in the local electric lighting and railway securities with which the T.-H. and G. E. Companies flooded every financial institution in that section. One half of this cartoon represents a street car drawn by a pair of mules in the street of the hamlet of Sleepy Hollow. On the scene is a G. E. promoter telling the owner of the road how to get rich, to wit: by adopting electricity and bonding his road—"We will float the bonds." Next is a forlorn farmer, resting on his hoe for a moment while the trolley car from Sleepy Hollow to Never-make-a-city passes through his fields. The query is raised, Who pays for it?

This is the query which was raised by every thoughtful man in this business when the great financial scheme of Mr. C. A. Coffin first became conspicuous, when it became almost impossible for conservatively managed concerns to sell apparatus on a cash basis, even at a price 20 per cent. lower than that obtained by the T.-H. schemers, who took bonds in return—who not only took bonds but who begged for bonds, who preferred bonds to cash, who would take bonds on anything, and who were advised by Mr. Coffin that he could sell any kind of bonds, in any quantity, if they did not cost more than 60.

Mr. Coffin's answer to the query was always about in this strain: "These bonds have 15 to 20 years to run, and many things can happen in that time. I expect the wonderful development in the business to pull us through."

We do not think he expected anything of the kind. He no doubt *did* expect the scheme to last a little longer. He hoped, of course, that the roads financed would at least pay interest on their bonds until such time as he was safely out of the way. He was, however, actuated by no higher motive than the burglar or the bank thief, who knows the enormity and the penalty of his crimes but who always hopes to escape detection.

While the cartoon to which we have referred was intended for ridicule, it represents (barring poor artistic work) just exactly the scheme which Mr. Coffin carried into effect, and which he was weak-minded enough to suppose could last for ten or fifteen years.

In the last annual report of the G. E. Company there appears a complete list of the company's holdings in various local properties to which the Coffinesque scheme of financiering was applied. The list is a long one. We have taken from it *every street railway* property mentioned, investigated the status of the various companies, and present the tabulated results for the consideration of the public. Part only of the total issue of these local securities is held by the G. E. Company, the rest having been transferred to the various financiering companies, and many millions at par value have been unloaded upon ignorant and trustful investors in New England and elsewhere who had no suspicion that the former Quaker leader would turn into a cold-blooded and calculating swindler in less than ten years.

We are preparing now a similar statement of the lighting companies, and it is already apparent that the showing made by the railway companies is not at all an unfair standard by which to judge the entire financiering plan. Its results have been the same to whatever business applied. Indeed it could not have been otherwise. There are laws of health which no man can ignore without paying the penalty, and there are just as certainly laws of business which no corporation can violate without suffering the sure punishment.

The casual reader may suppose that this woful result could not have been foreseen. This is not the truth. Not one week passed after Mr. Coffin's scheme was launched but he was warned of the inevitable end. Whatever the public or the local street railway people themselves may have thought of the possibilities of the application of electricity, the sound men in this trade early knew the limitations as to economy in operation, and it took no wise man to know that where there were no people there could be no fares collected.

No man in the trade *knew* more about this than C. A. Coffin. He had made a study of the subject.

Fortunately, ELECTRICITY's deductions from the table submitted, and from the other well-known results of the infamous plan, are not without the support of the highest authority on street railway finances and capitalization. In his recent book, "Street Railway Investments," Mr. E. E. Higgins, who has perhaps given the subject more attention than any other man in the country, lays down a few general laws as to capitalization and the possibilities of success, which are worthy of full credence, except that Mr. Higgins has erred on the side of liberality towards the railway companies. We will make a few comparisons of the Coffinesque scheme of capitalization with the laws which have been found by examining hundreds of street railway properties to be safe. Our readers can carry the comparison to every railway property in the G. E. list, and they will find that *every single system was capitalized from 100 to 900 per cent. above what it should have been.*

Considering cities of 15,000 to 25,000 inhabitants, the author, while admitting that an occasional system is apparently profitable, says:

"When we remember that the charges for maintenance will increase from year to year as the new track and equipment wear out in service, and when we realize how small is the total of net earnings, we cannot but fear that the latter will dwindle to the point of disappearance."

And further:

"None of the securities are worth the consideration of investments of other than local capitalists, who may be able to give personal time and care to the management of the properties."

Out of the forty properties in the G. E. list part of the securities of which have been foisted upon the public and part upon the G. E. stockholders by the perfidious management as assets, twenty-one are in towns of less than 25,000 people—overcapitalized and worthless at best.

For towns of from 25,000 to 35,000 people Mr. Higgins finds that the limit of capitalization warranted is $12.50 per capita. This would allow for the Little Rock system a capitalization of $322,500 instead of the $800,000 placed upon it on Mr. Coffin's advice, and for Pueblo $306,250 instead of the $1,200,000 under which it was wrecked.

In towns of 35,000 to 50,000 the allowance is $15 per capita, giving the Los Angeles road $750,000 against its present burden of $9,000,000. No wonder it is in the hands of a receiver, and that every purchaser of the securities has lost nearly all of his investment

In larger cities it is found that from $15 to $25 per capita is reasonable. This basis would have given to the Rochester system $3,345,000 against its present bonded debt of $5,000,000 and $4,121,500 of stock, or over $9,000,000, all told.

Can the purchasers of such securities as appear in this list realize the situation, see how they have been duped, without a feeling of resentment? Is it any wonder that a journal like ELECTRICITY, in its endeavor to be true to the best interests of the trade it represents, inveighs against the conduct of our large manufacturing companies and against those responsible for the policy of those companies?

The wonder is that those who have committed these crimes are still allowed to appear in association with men who value their reputations as representative business men.

To show the desperation and thoroughness with which this scheme of floating worthless bonds was worked, it is only necessary to say that in the proscribed list of cities between 15,000 and 25,000 in population—91 in number—81 have been supplied with street railway systems, and 80 per cent. of the total mileage is electric; of the 35 cities between 25,000 and 35,000, all have systems, and 75 per cent. of the mileage is electric.

The full results of the swindling scheme are not yet apparent, but no man can give careful attention to it without reaching the conviction that every railroad property financed by the T.-H. or G. E. Company must ultimately end in a receivership, a scaling down of the capital, and in infinite loss to the unfortunate dupes who were misled into purchasing the securities; further, that the financing companies are themselves built upon a watery foundation, *and must fail*; that the G. E. Company itself is driving with absolute certainty to a disastrous and disgraceful wreck, and that no power known to the commercial world can save it.

Of the forty roads in the table compiled, one has not been discovered—the Alamo Electric Street Railway Company. Mr. F. P. Fish says it is in San Antonio, and perhaps it is. No record of it, however, is found in any of our books of statistics, and a gentleman in San Antonio writes us he never heard of it. Twenty-six are in the hands of receivers, or have defaulted and escaped a receivership temporarily.

Of the total mileage of the roads listed 764 miles are in the hands of receivers against 214 of solvent companies. The capitalization of the bankrupt properties is $78,[illegible]46,00[illegible] and of those which have so far averted a confession of insolvency $18,673,500.

The record is a black one, and is without one palliative feature. It is exceeded in magnitude in the case of steam roads, but not in baseness.

Justice moves slowly, but those responsible for the sale of these millions of spurious securities, with the consequent depreciations and sufferings entailed upon innocent purchasers, can not escape.

ELECTRICITY will not rest until they are driven from the electrical field in disgrace, their places filled by men who will labor for different ends.

Under the Searchlight.

Views and Opinions on Timely Topics.

A LAW went into effect in Illinois on July 1 requiring companies incorporated after that date to pay a tax on their full capitalization, whether resting upon money, patents, wind or water. Among the new and promising enterprises which hastened to secure incorporation papers the last week before the law took effect were the following:

Name.	Capitalization.
Inter-Ocean Electric Railway Company	$200,000,000
Chicago Giant Electric Motor Company	15 ,000,000
Cosmelectric Company	10,000 000
Elliott Magnetic Electric Company	1,000,000
Chenoa Electric Light and Power Company	15,000

We advise Chicago investors to put their money into the latter concern in preference to the others.

* * *

THE first number of Prof. Barrett's journal bore on the title page the inscription: "J. Allan Hornsby, M. D., Managing Editor." In the second issue the M. D. is omitted. Why? We understand that the erudite Doctor received his degree from the St. Louis Medical College, and he should not be ashamed of it.

* * *

Well Treated Abroad.

Frank Mason Will be a Major-General When He Returns.

(From the N. Y. World.)

London, July 6.—Capt. Mason, who has charge of the police telegraph system at Brooklyn, N. Y., has been having a good time in London. The officers of Scotland Yard have extended him every courtesy.

* * *

WE HAVE received many requests from constituents to publish further particulars in regard to Prof. John Poo-Bah Barrett's career, and as to his connection with various companies selling supplies to the city of Chicago—transactions in which he is said to figure on both sides. We are advised, however, that he is soon to be deposed from his official position, which will remove any interest that now attaches to him as a public man. We suppose we may look for a new book soon after his retirement, or a serial in the *Electrical Journal*, entitled "Reminiscences of a Fireman-Electrician, or The Difference Between Running Wid de Machine and Traveling Wid de Gang."

* * *

The Print You Stole, oh Stevie Cole.

Oh give us back that photograph,
  Said Foster—Oster—Davis;
It is a sin, though you do laugh,
  So give it back and save us—
The print you stole, oh Stevie Cole.[*]

We laid our plans to have it go
  To all our old subscribers,
To gain some new ones, too; also
  To please our advertisers—
The print you stole, oh Stevie Cole.

Our plans are now, alas, upset—
  We owe it all to you—
The photograph *we* paid to get
  Was *scooped* by the *Review*—
The one you stole, oh Stevie Cole.

And Stevie Cole, God shrive your soul,
  And may the Lord forgive us!
We'll yet get square for what you stole,
  Said Foster—Oster—Divvus,
Whose print you stole, oh Stevie Cole.

"ELECTRICUS."

---

[*] This is poetic license. The word is by right plural. While it would not be quoting properly to say "carry *coal* to Newcastle," it is claimed by Foster—Oster—Davis that it would be equally proper to "carry Cole to Sing-Sing" as to "carry Coles to Sing Sing." The poet prefers to use the singular, since it rhymes better with stole.

* * *

THE appointment of a receiver for the Schuyler Electric Manufacturing Company ought to result in exposing fully the recent attempts of the G. E people to freeze out the minority stockholders of the Middletown concern. The G. E. Company owns $3[illegible]1,930 of securities in the Manufacturing Company and $50,000 in the Schuyler Electric Company.

* * *

Great Men Agree.

(From the Mail and Express.)

Will it (electricity) drive the locomotive into the round house for the last time, to be broken up and sold for old metal, and are we now listening to the last shrieks of the iron horse, soon to be superseded by the strange-voiced steed of some higher civilization?

Mr. Westinghouse will tell you he thinks so. Russell Sage, who has built a score of railroads, will agree with him. So will T. Commerford Martin, Joseph Wetzler and nearly all other electrical experts of the country.

* * *

WE ARE told that some of the gentlemen importing foreign carbons are *escaping payment of proper duty* through undervaluations. They are not wise. ELECTRICITY'S Searchlight is now turned on the New York Custom House. The penalty is a severe one, and the fine for one offense may easily wipe out the profits of a year's business. Besides, carbons good enough for any service are now made in this country, and ELECTRICITY believes in patronizing home industry.

* * *

ELECTRICITY has an esteemed contemporary in Electricity sired by Electioneer, dam Midnight, and who has made a record of 2:17¾. This was fast time once, but if our namesake does not want to be disowned by us he will need to knock just 12 seconds off his record, and even then he will be several seconds slower than we are.

* * *

The Louisiana Light Company Matter.

(From the Picayune.)

The charges of fraud which were so liberally interspersed in the petitions of complainants receive but little attention at the hands of the court. The Judge admits that there are matters unexplained which have left on his mind impressions that there may have been mismanagement or acts in which some of the active directors represented more their own individual interests than those of the company, and were ultra vires, but the impression was evidently not sufficient to warrant an investigation, for none was made, and it may be considered a victory for the Electric Light Company.

LEGAL NOTES.

The sheriff has received an execution for $6,483 against the Lawrence Electric Company, of No. 130 Pearl street, New York, in favor of William Lawrence. F. H. Mollenhauer has obtained a judgment for $1,041 against the company.

In the case of the Millville Traction Company *vs.* Goodwin *et al.*, restraining the defendants from interfering with or obstructing the running of the street cars of the company, Vice-Chancellor Bird, at Trenton, N. J., has filed a decision, ruling that the defendants had no right to obstruct or interfere with the running of the cars. The defendants attempted to move a two and a half story frame house across the street occupied by the traction company, and for 111 feet along it. This would necessitate the cutting of the wires and the stoppage of cars on the street for several hours. There was a great deal of local excitement caused by the affair at the time, and the authorities had to disperse mobs of rioters at the scene several times.

The Postal Telegraph Company obtained control of the main line of the unsuccessful United Lines Telegraph Company, between New York and Washington, which was covered by mortgages of over $1,800,000. Last November the United Lines was sold, but only $300,000 was realized. On the 3d inst. a deficiency judgment for $1,559,886 was recorded against the company in favor of the Farmers' Loan and Trust Company, trustee for John W. Mackay and his associates, who were bondholders. The United Lines Company will now be absorbed by the Postal Telegraph Company.

The General Term of the Supreme Court has rendered a decision in an action brought by Franz Herz enjoining the distribution of $500,000 of gold debenture bonds issued by the Interior Conduit and Insulation Company.

O. S. Platt vs. Bryant Electric Company.

A temporary injunction has been issued against the Bryant Electric Company of Bridgeport in an action brought by O. S. Platt claiming infringement of various patents on switches.

A New Electrical Phenomenon.

The study of crystallization has provided its devotees with many beautiful effects, not to say delightful surprises, and although our knowledge in this direction is not very extensive, every year large accumulations are made to it, especially to that branch known as crystallography. Now amongst those effects which we have referred to as beautiful is the following: At the moment of crystal-forming, some substances emit a flash of light. This can be demonstrated easily. For example, let a glass cylinder be half filled with warm saturated sodium chloride solution, and into it let there be poured an equal quantity of hydrochloric acid (sp. gr. 1.12); then let the solutions be well mixed by stirring with a glass rod, when a bluish-green light will pervade the whole cylinder. Or the two liquids having been carefully poured in so that the one is superimposed upon the other, let the cylinder be suddenly and strongly shaken, when a flash of light will occur. Alcohol may be used in place of the acid, and similar effects may be obtained by the use of potassium chloride or bromide, instead of the sodium salts. So much for the way of producing the phenomenon. Hitherto no one has said much more regarding it than that it is very beautiful and interesting—an obvious sort of conclusion which has at least the merit of being a safe one. But now we find E. Bandrowski coming forward with a theory which, if unassailable, will place this phenomenon in that ever increasing category of what we style "new electrical phenomena." He considers that the light emitted during crystallization is electrical, and is due to the union of electrified ions. If this is true, the light should be more marked in the sudden crystallization of strongly dissociated compounds. And this appears to be the case. —*Electrical Review*, London.

THE SUBSTITUTION OF ELECTRICITY FOR STEAM IN RAILWAY PRACTICE—II.*

BY DR. LOUIS DUNCAN.

THE BALTIMORE BELT LINE TUNNEL EQUIPMENT.

The General Electric Company was confident enough of its ability to successfully equip the road to make a contract with the Baltimore and Ohio Company to haul its trains over the Belt Line, the contract being dependent upon the successful operation of the plant. The total length of the line equipped is about three miles, the extension beyond the tunnel being for the purpose of assisting the freight locomotives to haul their trains up the one and one half per cent. grade on the line beyond the tunnel. There are to be three locomotives and it is calculated that the traffic can ordinarily be handled by two of them. The steam engines are not to be taken off the trains, but hauled through the tunnel by the electric locomotive which switches off at the terminus of the line. To operate these machines a station has been erected which contains 3,000 H. P. of electric generators, and an overhead line has been equipped to transmit current to the locomotives. With respect to the station itself there is little that is novel. There are four 750 H. P. Allis-Corliss engines directly coupled to generators of the same capacity, the generators having a voltage of 600 at no load and 700 at full load. Foundations have been partly erected for a fifth unit in case it is found necessary. The building also contains the lighting plant, having a capacity for 400 arc lights and 4,000 16 C. P. incandescent lights. Provision has also been made for an extension to this lighting plant when the stations for the belt line are erected. There are two incandescent machines and one of them will be used to supply the 1,000 32 C. P. lamps which have been installed in the tunnel. Perhaps the most novel feature of the plant is the overhead structure which is employed. The conditions to be met were peculiarly difficult, and the ordinary under-running trolley was considered impracticable. The tunnel is very low in places and the management of the road decided that the conductors could not be placed in the middle of the tunnel between the tracks. Outside of the tunnel the conductor is still between the tracks, but is elevated to a height of 22 feet, while inside the tunnel it is only 17 feet from the top of the rail. The conductor consists of an iron trough made of two Z bars riveted to a cover plate 12 inches wide, leaving a slot one inch wide between the Z bars. In the tunnel this trough is supported from transverse channel bars secured to expansion bolts which are fastened from the top of the tunnel. There is a double insulation, one porcelain insulator being between the channel bars and another between the channel bars and the expansion bolt. Outside the tunnel the trough is supported as follows: At distances of 150 feet light iron columns with cross trusses are erected, and between these trusses are hung catenaries supplied with a number of suspension bolts. Transverse channels similar to those used in the tunnel are fastened to these bolts and the trough is fastened to the channels. The Z bars are made in lengths of 30 feet, the opposite bars breaking the joints with one another, the lengths being riveted together and then bonded with "Chicago" rail bonds. Suspended on the same transverse beams as the trough are three copper cables of 1,000,000 centimeters area, which serve as feed wires which are connected at intervals with a trough, there being of course one trough for each track. For the return circuit the tracks are bonded as in ordinary railroad work, there being cross bars and at intervals connections with a copper cable of 1,000,000 centimeters area varied in a wooden trough between the tracks. The contact arrangement that is to be used consists of a brass shoe travelling in the trough and connected with a locomotive with a flexible sawbuck arrangement which has a very considerable range in every direction. The current is transmitted to the motors by a copper cable, and in case of the shoe sticking in the trough, a safety pin is arranged to break with any desired strain. Where switches are used there is a tongue worked by the lever which operates the track switch, and which serves to direct the shoe. This structure, although exceedingly massive and expensive, promises to give an excellent contact at all times, and it requires no care from the motorman.

The locomotives are the most massive in the history of either steam or electrical transportation, and the weight, which amounts to 95 tons, is on eight driving wheels, so that the full tractive power of the locomotive will be developed. On each axle there is sleeved a six-pole motor, there being considerable play between the axle and the sleeve, which latter is spring supported from the frame. In this way any heavy blow due to irregularity in the track is taken through the springs, and the wear both of the track and locomotive is reduced. On the armature shaft are projecting arms which move between lugs cast on the wheels, thus allowing the necessary relative motion between the axle and armature.

The situation in the Baltimore Belt Line is this: The station is completed and is being operated daily. One of the locomotives is on the ground, set up and ready to run,* the overhead work is finished with the exception of a short length which was interfered with by a temporary bridge over a cut. The latter has been removed.

If this equipment proves successful it will open a limited but important field for the introduction of large electric locomotives. There are in the United States a number of tunnels, whose operation is anything but satisfactory at present, which can be equipped as the Baltimore tunnel is equipped. Several of them have the additional advantage that they are near the switching yards of the roads, and the same plant could be used for hauling trains through the tunnels and for switching, and not only would the economy of the station be increased, but the substitution of electric for steam switching engines would result in a very considerable saving.

---

* From Dr. Duncan's inaugural address to the American Institute of Electrical Engineers, Niagara Falls, June 25, 1895.

* Operated June 27.

Advice to the "Electrical Engineer."

(From the Pacific Electrician.)

ELECTRICITY has called on the *Electrical Engineer* to point out its power plants where electricity is transmitted a distance of twenty miles or over, for both power and lighting purposes. If the *Engineer* will write to the *Lassen County Advocate* at Susanville, Cal., and secure the address of its expert, it may get the information it needs.

Mr. Thomas, the man who has the aerial railway that was invented by a blind man, proposes to construct an electric road, strung on wires from the top of Grizzly Peak to Goat Island.

Probably he will plant an Emme battery on Goat Island, and a Feltz battery on Grizzly Peak, and the resulting excitement (among the stockholders) will create enough energy to operate his cars at a speed of 100 miles an hour. Mr. Thomas's desire to get to the top of Grizzly Peak, and in such fast time, is supposed to be due to the fact that Mr. John Chetwood, a San Francisco attorney, is after him with a judgment of robust dimensions.

NOTES ON THE RECONSTRUCTION OF A SMALL CENTRAL STATION PLANT.*

BY FRANKLIN L. POPE.

The distribution of rainfall throughout the year should be studied. It is often materially modified by local geographical conditions. The diagram shows that the distribution on the headwaters of the Housatonic is quite different from the normal type of the northeastern region. The same may be true of other rivers

While this investigation was going on, it was discovered that actual measurements of the volume of water in the Housatonic had been made in 1873 by the engineers of the New York Department of Public Works, with reference to its utilization as a future source of water supply for that city. The minimum summer flow was found to be (as given in the engineer's report), 0.34 C. F. per second per square mile. It was also learned that measurements made on several different occasions at Birmingham, Conn., in very low stages of water, gave an average of 0.32 C. F. per second per square mile. It was therefore assumed that Mr. Fanning's estimates were at least on the same side. The greater volume water found by the actual measurements is doubtless due to the fact that there are some 5 or 6 square miles of reservoirs, consisting of natural and artificial lakes, on the upper waters of the Housatonic, which are drawn upon by the numerous mills on the river as an extra supply during the season of drought.

A minimum flow of 0.25 per second per square mile would give at Glendale, 4,035 C. F. per minute. Multiplying this by the weight of a C. F. of water (63.3 lbs.) gives 255,415 foot pounds which, divided by 33,000 gives 7.74 gross horsepower per foot of fall, or a total of 196 H. P. for the 13 foot fall at Glendale. The average efficiency of a good turbine may safely be taken at 75 per cent. which would give 67.9 as the available H. P. during the whole 24 hours, in time of lowest water. In electric lighting, however, the great bulk of work is done within a period of 4 hours (in summer time), and hence it is possible, in case there is sufficient area of pondage above the dam, to increase this capacity by storage at least four-fold, which would raise the limit of minimum available power during lighting hours to 271.6 H. P., an amount which was considered to be ample to meet all the probable requirements of the Great Barrington plant for many years to come.

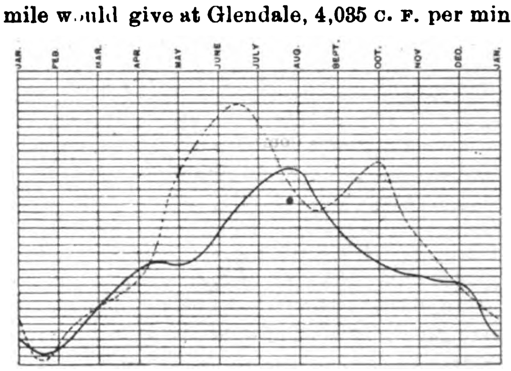

FIG. 1.—Curve of mean annual distribution of rainfall. Full line is reduced observations at Williamstown, Mass., 1816 to 1874. Dotted line is mean of all observations in the Hudson and Champlain Valleys, and Northern and Western New York, aggregate 564 years.

While negotiations were still pending with the owners of the Glendale privilege, and also the one in the village already referred to, overtures were received from a manufacturing company owning a third exceptionally desirable privilege, on the same stream, at an intermediate point considerably nearer than Glendale. This company had only recently completed a new dam, head-gates, raceways, etc., at a very considerable expense, and was willing to lease the complete establishment, including a new McCormick turbine of 325 H. P. and a two-phase Stanley generator of corresponding capacity, at a monthly rental, based upon the actual output as measured in killowatt hours at the dynamo terminals, provided that a certain minimum monthly consumption was guaranteed. With the same volume of water as at Glendale, the fall at this point was 20 feet, assuring at least 417 H. P. at lowest water during lighting hours. All the hydraulic apparatus and appointments were of the best possible construction, and well calculated to insure absolute permanency of operation.

---

* A paper presented at the twelfth General Meeting of the American Institute of Electrical Engineers, Niagara Falls, June 27, 1895.

The minimum rental required was somewhat less than the amount of the coal bill of the Great Barrington company for the preceding fiscal year, but while the immediate saving in operating expenses was not large, the acceptance of the proposition would place the company in a position to reduce its rates to consumers, for the reason that its output might be very largely increased without materially augmenting its operating expenses. A lease for a term of years was accordingly closed.

In laying out the plant it was determined to bring the main feeders directly to a distributing station in the village, to be used principally as a convenient headquarters for testing the circuits and controlling the street-lighting service. In laying out the transmission line, a surveyor was employed, and a preliminary line was run directly from the power-house to the distributing station. The air line distance was found to be 5.15 miles. With the assistance of the surveyor, the actual line was then staked out, going directly across country, and keeping as near as circumstances permitted to the transit line. About half the distance, the transit line was found to so nearly coincide with existing highways that the consent of the local authorities was obtained to set the poles along the highway location; the remainder of the route lay principally through uncultivated land of little value, so that a comparatively small expenditure was sufficient to secure a release from all claims for land-damages. This enabled the line to be located with long stretches absolutely straight, avoiding all sharp angles; a very important consideration when heavy wires are used. The poles were of selected chestnut with natural butts, usually set five feet in the ground at maximum intervals of 125 feet. The poles were ordinarily 25 feet long and 8 inches thick at the small end. Shorter poles were sometimes used on elevations and longer ones in depressions, in order to equalize the strain as much as possible. The insulators used were of the large double-bell white porcelain type (German Government standard), and were imported by us from Berlin. The insulator of the top wire is set upon a malleable iron stem 14 inches long screwed into the top of the pole which is tapered to 5 inches diameter and protected from splitting by driving on a wrought iron ring. The tapered part of the pole as well as the top was given a coating of mineral paint mixed as thick as it could be spread with a brush. The insulator of the second wire is carried on a malleable iron gooseneck screwed into a ⅝ inch hole bored in the side of the pole, in such a position as to bring the wires about 16 inches apart. Another hole was bored on the opposite side of the pole, intended to take the gooseneck of the third wire at some future time, leaving the same interval between the second and third wires. The porcelain insulators are fixed to their iron supports by a packing of oakum placed between the screw-threads, which serves to prevent any danger of breakage by expansion or contraction. The line wire is laid in a groove formed in the top of the insulator, except upon the curves and angles, in which case it is tied at the side in a circumferential groove, as is usual in this country. The German method of tying is quite complex, and unnecessarily strong; in case of undue strain, if anything gives way it had best be the tie-wire. We therefore devised a simple tie which was easily and quickly applied, and which has so far served an admirable purpose. We were obliged to string the wires during very cold weather; sometimes as cold as 8 or 10 degrees below zero, and hence it was necessary to strain them very tight. A block and fall and a well-trained horse were used in pulling up, usually six or seven spans of one wire at a time. The hook of the block was always attached to the copper wire, whether bare or insulated, with a chain-knot made of ¾ inch rope. The feeder-wires were of No. 3 B. & S. soft copper, covered with weather-proof "insulation" along the highway (as a concession to enlightened public opinion), but elsewhere bare. The lengths of wire were joined with McIntyre twisted couplings; the unusual strain we had to put upon them occasionally pulled one apart, and this led us, out of abundant caution, to solder them, although this was for mechanical rather than electrical reasons. Only two feeder wires have as yet been strung, providing for a single-phase current from one side of the two-phase generator, but it is the intention to run a third feeder hereafter, which will enable two-phase induction motors to be connected to the same distributing system.

A pair of telephone wires of No. 12 steel were strung below the feeder wires, and these were supported upon small German porcelain insulators on iron goosenecks on opposite sides of the poles. These wires were transposed at intervals of about a mile, in order to eliminate the inductive effects of the alternating current in the feeders. The feeder lines were carried under the railroad at an undergrade crossing by placing the insulators upon iron brackets leaded into stone abutments. The plan of construction above described makes a strong, handsome and durable line, while the insulation of the circuit even in the worst weather is simply faultless.[*]

The system has been planned to deliver the current at the distributing station at a uniform pressure of 2,100 volts. Two distributing centers were fixed upon in the old Edison three-wire network, and at each of these points a pair of large transformers, having a ratio of 20 : 1, were fixed upon a pole, with their respective primaries in series between a pair of branch feeders from the distributing system, and their secondaries were coupled in series in like manner with the neutral wire between them. None of the consumers on the old Edison system knew when the change had been made to the new service from anything they were able to notice in the behavior of the lights.

The next thing done was to reconstruct the street lighting system. In place of the 36 arcs of 1,500 nominal C. P. formerly in use we substituted 126 incandescent lamps of 50 volts and 32 C. P., placed in Iona fixtures projecting horizontally from the poles 14 feet above the ground. The lights, as a rule, were fixed upon every alternate pole, but in the business center, the street being broad, they were placed on each side at intervals of about 250 feet, and staggered so as not to come opposite each other. A Shallenberger shunt cut-out was applied to each lamp. The usual number of lamps in each circuit was 42, although we have since placed, in some cases, as many as 47 in one series without reducing the brilliancy of illumination sufficiently to be noticeable by anyone but an expert. One end of each street lighting circuit is joined to a special feeder leading to the sub-station, where it is connected with the main feeder through a knife-switch. The other end of each circuit is connected to any conveniently located branch feeder of the regular commercial lighting service.

Each lamp circuit has, or will have, a fuse-block and cut-out inclosed in a weather-proof box at each end, where it joins the opposite feeders. These 32 C. P. lamps, when run at full candle power, furnish a most satisfactory illumination and give the streets a very attractive appearance. So far as possible each lamp was located with the aid of a transit and level, so as to get them in absolutely straight lines both vertically and horizontally, a precaution which adds materially to the decorative effect. It is admitted by all that the streets of the town are much more satisfactorily lighted by the incandescents than they formerly were by the arc lamps, while the actual cost to the company is considerably less. The new lamps were cut-in one at a time, on the old arc wires, jumpers being temporarily placed across the terminals until everything was in readiness to discontinue the use of arc machines.

One of the most marked advantages of the series street lighting system, especially when shunt cut-outs are used, is its great flexibility and convenience. For example, instead of placing 40 to 45 50-volt lamps in one series, we may use 20 to 23 100-volt lamps, or if an odd number be required, less than is necessary to make up a circuit, the deficit may be supplied by adding extra shunt-boxes in series at any convenient point in the circuit, until the pressure has been reduced to the required point. From time to time, as new lights are added, these spare shunt-boxes are one after another brought into use in connection with them. Sometimes, also, we temporarily install extra street lights by connecting them in parallel to the secondary mains of the regular commercial service, ultimately transferring them to new series circuits.

It has been found to be desirable to use a lamp of rather low efficiency for the street lighting service, as there is always danger of leakage and short circuits from wet boughs of trees and other objects getting into contact with the wires, and thus diverting an abnormal current through some portion of a lamp circuit. In such a case a lamp of high efficiency is pretty certain to be burned out, or at least to have its career of usefulness materially abridged. In this plant the average consumption of energy in the street-lights, including lamps, lines, shunts and leakage, is found to be about 140 watts per lamp of 32 C. P.

Perhaps the most ticklish part of the whole undertaking was the changing over of the Westinghouse system, which was a 1050-volt primary and a 52-volt secondary, running at 16,500 alternations. In accordance with the new plan, it was of course necessary to double the pressure both in the primary and secondary circuits, and to substitute 104-volt for 52-volt lamps throughout. A preliminary test of one of the transformers demonstrated that which perhaps might have been foreseen from theoretical considerations, viz., that a dangerous quantity of heat was developed within a few hours when it was used to convert from 2,000 volts down to 100. In order to utilize, so far as possible, the old transformers, and at the same time avoid the above difficulty various expedients were resorted to. Wherever a group of consumers was located in one neighborhood, a pair of large transformers was installed, with secondary mains extending from 500 to 600 feet in various directions, these transformers being of course placed in series with each other. Scattering consumers as far as practicable were connected together in small groups and supplied by a pair of small transformers coupled in the same way. The Westinghouse meters, having been originally constructed for a frequency of 16,500 alternations, ran slow when the frequency was reduced to 8,000. The necessary coefficient for correction of the readings was easily ascertained by experiment, and as fast as possible the meters were fitted with new disks, supplied by the Westinghouse Company at a trifling expense, and adapted to the lower frequency.

---

[*] I regret that I am unable to present any actual measurements of the insulation of the line of the Great Barrington company, no opportunity having occurred since the work was completed of making tests under atmospheric conditions of minimum insulation. Several years ago, however, while engaged in telegraphic service, I made a series of nearly 100 separate tests in rainy and foggy weather, extending over a period of five years, of a set of 10 porcelain insulators of the same make and pattern in every particular as those now on the Great Barrington line, erected on a house-top in the city and therefore much exposed to smoke and dirt. These measurements gave a mean resistance of 28.3 megohms, and a minimum resistance of 19 megohms per insulator, on a metallic circuit: therefore the minimum insulation resistance at each pole would be 38 megohms. On the Great Barrington line of 28,260 feet there are 250 poles and other supports, and hence we may assume that the minimum resistance of the insulation of the circuit as a whole would be 152,000 ohms. The current loss by leakage is found by dividing the mean voltage by the insulation resistance: $\frac{2,200}{152,000} =$ 0.014 ampere; an amount too small for serious consideration.

Of course it will be understood that the reason for resorting to these various shifts and expedients was merely that we might utilize the old apparatus as far as it could possibly be done, and also that we might carry on the work of reconstruction, for the most part, with the ordinary working force of the establishment.

The horizontal double turbine which is used to drive the two-phase generator has done such good work that it deserves a few words of commendation. The selection of the best among the many available types of turbines for electric work is a matter which merits far more consideration from a scientific standpoint than it generally receives. Water-wheels, like dynamos and motors, are sometimes sold on commission by agents, and it not infrequently happens that the salesman who makes the largest "claims," especially if he sells his goods the cheapest, carries away the contract. It needs to be said, however that there is a far greater difference than is often suspected in the amount of work different types of wheels will do with a given, and especially a limited, amount of water. There are, furthermore, a great many types of wheels in the market which, although as efficient as could be asked for with a full volume of water, are very far from being so when the volume of water is reduced, even by a comparatively small percentage. It is but just to say that it is seldom that a turbine makes so favorable a showing, not only in this but in other respects, as the one provided by the company from which we lease our power. The following figures are selected from a much larger number obtained by actual measurement of its performance in the testing-flume of the Holyoke Water-Power Company.

Head acting on wheel feet.	Revolutions per minute.	Quantity of water passing through wheel (cu.ft. per sec.)	Horse-power.	Per cent. of Efficiency.
16.6[illegible]	1[illegible]6.25	81.75	124.[illegible]0	80.99
16.80	155.00	[illegible]0.79	10[illegible].37	81.18
17.02	154.50	[illegible]8.4[illegible]	95.86	78.39
17.26	156.75	52.19	78.42	71.95
17.44	15[illegible].25	42.55	58.71	63.90

These results are worthy of particular note, for the reason that they show a very high percentage of efficiency maintained through a wide range of variation in the quantity of water passing through the wheel, a most valuable characteristic for electric work. When the quantity of water used was diminished from 81.75 to 42.55 cubic feet per second the percentage of efficiency fell only from 80.99 to 63.9, and what is even more remarkable, it was found that the efficiency remained well above 80 per cent. over a range of variation of discharge from 83.22 to 70 cubic feet per second or 15.9 per cent. More than one type of turbine which enjoys a high reputation and extensive sale among manufacturers will not reach 65 or even 60 per cent. efficiency at "three-quarters gate," while the 33" wheel above referred to has been found to give by actual test 78 per cent. under similar conditions.

The turbine carries upon its shaft a driving-pulley 100 inches in diameter, weighing 11,000 lbs., which serves as a balance-wheel. It is also provided with a Replogle electric governor operated by three cells of gravity battery, which has never failed to do its work quickly and certainly, even under trying conditions.

In carrying out this work, some things have been learned by experience which may be of use to others called upon to advise or to undertake the construction of similar works, and I will therefore venture to summarize some of my conclusions as follows:

1. In considering the advisability of operating an electric plant by water-power do not on any account neglect to ascertain from authentic sources of information just how much water can be depended upon during the low stage in an extra dry year, *for this is the measure of its value for electric work* except when used as an auxiliary to steam. The ordinary estimates of the commercial value of a water-power are only too apt to prove preposterous exaggerations.

2. If rights-of-way or releases of damages can be obtained without too much trouble and expense, it is better to build the feeder line as directly across country as may be than to follow a highway. The saving in cost of construction will usually be more than enough to pay for the right-of way, and on such a route there need be no interference from trees, while many inconvenient angles and much trouble in guying and bracing are avoided. Shorter and stouter poles may also be used, in itself a very important consideration.

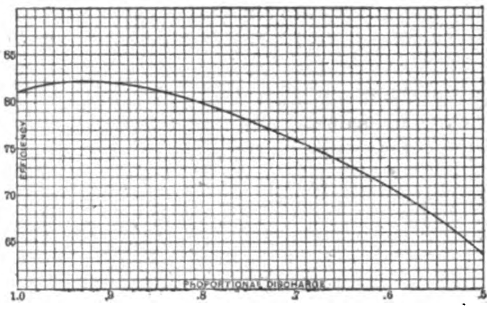

FIG. 2.—Efficiency Test of McCormick's Turbine.

3. In electric line-construction it is preferable to dispense with cross-arms unless there are more than six wires. The best arrangement is to place one wire on a top-pin and the others alternately on the front and back of the pole, at a vertical distance apart of 12 inches. This construction not only costs less than properly braced cross-arms, but is much less conspicuous and therefore much less objectionable in a public street, is less interfered with by trees, and is far more durable. Much trouble is caused by the decay of cross-arms after they have been exposed a few years to the weather; they split at the ends so that the pins come out, and not infrequently break in the middle, thus fouling the wires.

4. In medium-sized towns and cities, especially in shaded streets, the incandescent lamp may be made to give a far better distribution of light for the same money than is possible with the "half-arcs" so extensively used, and is much less troublesome to maintain in good working order. My own experience leads me to think that the lamps ought not to be of less than 24 or more than 32 candle power. Use lamps of low rather than high efficiency, but run them at full candle-power, or even a trifle above. Good street-lights, well arranged, and renewed sufficiently often, are the best possible advertisement for any electric company.

5. Use large transformers as far as practicable, placing the consumers within 500 or 600 feet radius upon secondary mains. We have used both two-wire and three-wire mains. The latter plan is certainly to be recommended when the distance approximates or exceeds 500 feet, but for a short distance, as, for example, when distributing within a single block at a pressure of 100 volts or more, it is a question whether the gain in cost of copper over the two-wire plant is of sufficient importance to offset the additional complexity.

6. It was found that raising the voltage in the residence district from 1,000 : 50 to 2,000 : 100 greatly improved the uniformity of distribution by lessening the potential drop without entailing any corresponding disadvantages. It would seem to be preferable, on every account, to use the higher pressure.

7. One of the most important minor points in the management of a plant is apt to be too much neglected—the maintenance of the insulation of the wires by promptly replacing all cracked and broken insulators, and by keeping the wires absolutely free from contact with uninsulated objects. The covered wires which lead into the hoods of the street-lamps need to be carefully looked after.

8. Number all the poles with yellow paint applied with a stencil on a black ground, and keep a record book of the position of each one and its distance by the line from the test station.

9. In selecting a turbine wheel, consult competent authority as to the available fall and minimum quantity of water, and when making the purchase do not expect to get a thousand-dollar wheel for a hundred dollars. Pay a fair price and insist, not only that the wheel shall be well made in every way, but that it shall be tested by an expert before acceptance. If it does not give an average efficiency of 76 per cent. between half-gate and full-gate, it is not advisable to accept it, inasmuch as you can easily do better, as our own experience proves.

10. I think our experience shows that it is possible to largely increase the net earnings of an old plant without necessarily refitting it throughout, but plenty of time should be taken for consideration as well as for execution, in order to secure satisfactory results with a moderate expenditure.

London Notes.

(From our Special London Correspondent.)

Some time ago, as was stated in your columns, a London police authority announced that omnibuses, carriages, or similar vehicles propelled by electricity, running on the common roads, were liable under the Locomotive Acts, which made it necessary that a man with a red flag should precede each conveyance of the kind, and that a speed of three or four miles must not be exceeded.

A bill which is to overcome these too rigorous requirements has now been introduced into the House of Commons by Mr. Shaw Lefevre. It provides for the exemption from the provisions of the locomotive acts of such vehicles as are propelled by petroleum, steam, gasoline or electricity, and also exempts them from the ordinary locomotive tax of £10, allowing a maximum weight of two tons for each vehicle.

There is to be started almost immediately in London a double line of electric omnibuses, although Mr. Shaw Lefevre's bill cannot, of course, become a law for some considerable time

The routes for these omnibuses are: (1) Starting from Hammersmith by way of Notting Hill, along Bayswater Road and Oxford street, Hol-

born and Cheapside to Liverpool street; (2) from Hammersmith by way of Kensington, Piccadilly and the Strand, also to Liverpool street.

At various times during the last few years we have had a number of experiments on our streets with electric vehicles, but none so important as this present attempt.

The Westinghouse Report.

Results for the Year Ending March 31, 1895.

To the Stockholders of the Westinghouse Electric and Manufacturing Company.

Your Board presents herewith its report, with the financial statement for the year ending March 31, 1895.

The all-important feature of the year's business has been the creation of a magnificent workshop, having unequaled facilities for the carrying on of the business in which your company is engaged, and the concentration therein of the manufacturing operations formerly conducted under great difficulty in three widely separated works, with material stored in numerous warehouses.

These new works, located at East Pittsburg, about twelve miles east of Pittsburg, are extensive and exceptionally complete in every detail necessary to the production of the best class of apparatus at the lowest possible cost, and will thus insure to your company many advantages. These new works were erected during a period of exceptionally low prices for labor and material, and under other favorable circumstances, so that the cost shown in the accompanying balance sheet is greatly below earlier or present prices for like work.

As was to be expected, such extensive building operations and the removal of materials from the old to the new works reduced the output for the year to about three-quarters of what it would have been without the interruption and extra work entailed.

The annual meeting of the stockholders of the company was adjourned at the regular date (May 15) to July 17, as the transfer from the old to the new works had not at the earlier day been fully effected, it having proved far more difficult and complicated than your directors had anticipated. They are glad to be able to announce that it is now completed, with results which promise to be most satisfactory in the immediate future of the company. It was the desire of the board that at the annual meeting every opportunity be afforded the stockholders to see for themselves what had been accomplished, and so form their own opinions of the efficiency of the plant and the value of the property. This was not possible in May; it is possible now. The directors therefore earnestly invite all holders of the company's stock, who may be able and desire so to do, to attend in person the annual meeting on July 17 at Pittsburg, where special railway and other arrangements will be made. Meanwhile, the directors feel justified in saying that the works are as nearly perfect as they could now be made and are now operating to the entire satisfaction of those in charge, and that the production has already been increased to a point where the demands of all customers can be promptly met, and there now seems to be no reason why your company should not in the near future be as large a producer of electrical machinery as there is in the country.

In anticipation of the increased facilities which your company would have in its new shops, a large amount of time and energy was put into the development of new and better forms of apparatus for the trade, and this extra work together with that incident to the preparations necessary to occupy the new quarters increased the general and extra expenses to a figure somewhat above that for the year ending March 31, 1894.

So far as ascertained there was expended directly in removing the machinery and material $80,[illegible]9.54, after deducting which from the earnings from business and from other sources, there is left a net profit of $711,909.63.

This, also, it must be borne in mind, was the outcome of a business year during which, for reasons already stated, your company was working under conditions as to output which, in the opinion of your directors, were so unfavorable that the net results scarcely represent half of what might reasonably have been expected under ordinary circumstances.

LIGHT AND POWER PROPERTIES.

Your company has for the past six years been interested in two important light and power properties, namely, the United Electric Light and Power Company of New York, and the Brush Electric Company, Baltimore, Md. During the past year both of these companies, with the assistance of your company, have carried through financial plans which have put them on a prosperous business basis, and have given a large increase to the value of their securities held by your company.

The United Electric Light and Power Company, under the plan referred to, has acquired almost all of the stock of the Brush Illuminating Company and of the United States Illuminating Company, both of New York City, and is now completing and will soon have in operation one of the most comprehensive light and power stations in the United States. It has contracted with your company for ten complete electrical outfits of 1,000 H. P. each, and for all the converters and other needed apparatus, half of these outfits having been used for the World's Fair lighting. On the completion of the above contract your company will have in securities of the United Company:

First mortgage bonds	$918,000
Preferred stock	550,400
Common stock	411,700

having already received of the above amount, under the terms of the reorganization, for material, unsecured notes, claims and for a cash subscription of $200,000,

First mortgage bonds	$548,000
Preferred stock	187,500
Common stock	411,700

From its old stations this company is now doing a business of about $800,000 per annum, which should be more than doubled by the revenue from the output of the new station, giving it a net revenue sufficient to pay interest on its bonds and dividends on all of its stocks, there now being a demand for light and power sufficient to absorb the entire capacities of the stations of all existing companies.

Brush Electric Company of Baltimore, Md. In the reorganization of this company your company subscribed for $40,000 first mortgage 5 per cent. bonds and took in payment for machinery $170,000 first mortgage 5 per cent. bonds, making your company's total holding $210,000 first mortgage 5 per cent. bonds. Your company was the owner and now holds 5,060 ($100) shares of the common stock out of a total of 7,292 shares outstanding.

The station of the Baltimore Brush Company is new and is one of the finest to be found in the country. It has three of the World's Fair 1,000 H. P. engines and generators and has been supplied with a large amount of other electrical apparatus, and will be hereafter, as will also the United Company, a constant purchaser of your company's apparatus and supplies.

The fields of operation of these companies are unusually profitable ones, and it is believed by your management that the value of the securities of both properties will, in the near future, be equal to or above their par value (amounting to $2,591,100) and that the final profit to your company on these securities will be a large one. (See Note.)

Outside of the profit your company will make from its interest in the United Electric Light and Power Company of New York and the Brush Electric Company of Baltimore, your management anticipate a great addition to its business from the experience gained with these two companies and others in building light and power station throughout the country and the rebuilding on like lines of many antiquated plants, the managers of which are rapidly being forced to the conclusion that they can only continue to have a profitable business and successfully meet any competition that may arise by using multiphase alternating current generating apparatus directly connected with engine shafts whereby Tesla motor and all other services can be had from one class of machinery.

As stated in the last report, your company "has no contracts of any character with local lighting or other companies which can in any manner interfere with the sale of its apparatus."

The final closing of the World's Fair contract, and the cancellation of all the bonds given by your company for the faithful carrying out of the work, in connection with the profitable sale of the machinery used there, will make the following letter received from the President of the World's Columbian Exposition, Mr. H. N. Higinbotham, of interest to stockholders:

"World's Columbian Exposition,
"Executive Department,
"Chicago, August 27, 1894.

"George Westinghouse, Jr., Esq., President Westing-
"house Electric and Manufacturing Co., Pittsburg, Pa.

"Dear Sir: It is with great pleasure that I hereby acknowledge the important work performed by your company in and for the World's Columbian Exposition.

"Your company installed in Jackson Park fourteen (14) dynamos, having a total capacity sufficient for operating 188,000 16 C. P. lamps; these dynamos operated both incandescent and arc lamps, as well as small motors, the entire capacity being equivalent to over seventy-five thousand (75,000) 16 candle-power lamps. Your company installed this plant complete, including distributing system as well as inside wiring.

"Your contract required you to install, operate, maintain and remove your machinery; the task undertaken was one of great difficulty, as you were frequently delayed by the construction of other buildings and underground work by other contractors not being prompt in the execution of their contracts. The latter was done under very unfavorable conditions, owing to inclement weather, and the inside wiring was done hastily, as the position of lights could not be determined until shortly before the opening of the Exposition. Notwithstanding all these difficulties the result of your work was fully up to our expectations and the requirements of your contract; and I take pleasure in certifying to the fact that the World's Columbian Exposition were in every respect fully satisfied, not only with the plant, but with the work performed, and the uniform gentlemanly and courteous treatment received at your hands as well as from your subordinate officers.

"For this work I beg to extend to your company the thanks of the Exposition Management as well as my own personal acknowledgment for the many courtesies received at your hands. With respect, I am, dear sir, very truly yours,

"(Signed) H. N. Higinbotham.
"President."

COLLATERAL TRUST BONDS.

After full consideration of the subject, your board, under the powers conferred upon it by the company's charter, has authorized the issue of $1,250,000 ten year 5 per cent. collateral trust bonds, secured by certain bonds and stocks held by the company, provision being made in the deed of trust for the sale of a portion of all the securities, and for the cancellation of the corresponding amount of the collateral trust bonds secured thereby. It is proposed to fund out of the proceeds of this issue of collateral trust bonds an equal amount of debt, a greater part of which has been created in the building of the new works, the purchase of new machinery, and the outlays in connection with the financial plans of the United and Brush companies.

WESTINGHOUSE ELECTRIC COMPANY, LIMITED.

Your company during the past year sold additional patent rights to the above company, and with the proceeds purchased the preferred and common stock of a number of English holders, so that your company now owns $782,500 preferred and $1,307,400 common stock (together, $2,089,900) out of $2,[illegible]52,750 outstanding, and your company will hereafter direct all of its affairs. All apparatus sold by the London Company has been purchased from your company at profitable rates, and the business of the London Company has always been profitable, last year having netted nearly 5 per cent. on a valuation of $1,000,000. It is proposed to push the business in Great Britain, Continental Europe, and in the various colonies, in order to increase the sales of your company's product, there having been many inquiries during the past year which your company has been unable to respond to, owing to lack of manufacturing facilities.

It is believed that the new prices which we have been able to make to the London Company will enable its management to largely increase its sales and give a permanent value to all of your stock in that company.

PATENTS AND LITIGATION.

Your company, through its able counsel, has been successful in favorably terminating the litigation in respect to incandescent lamps, the feeder and main and other important patents, and it was especially successful in the celebrated Bate Refrigerator case before the Supreme Court, in which the life of a number of patents, which were being used to influence trade by your adversaries, was finally determined.

In the McKeesport case, argued in the Supreme Court, October last, involving the ownership of the carbon burner for incandescent lamps, no decision has yet been handed down, but the long delay on the part of the Court in arriving at a conclusion is regarded as no unfavorable to the sustaining of the claims of our Sawyer-Man patent.

To-day the most important inventions are those relating to the use of alternating currents, and your management believe that with the exclusive control of the Tesla patents its position in patent matters is more favorable than that of any or all of its competitors.

STREET RAILWAYS OPERATED BY UNDERGROUND ELECTRIC CIRCUITS.

Your company has secured the controlling interest in the stock of the Electro-Magnetic Traction Company of West Virginia, and through it the control of valuable inventions relating to the operation of street railway cars in large cities by means of underground circuits.

This system has been in continuous operation in Washington during the past year, and is now in successful operation on the tracks of your company in and about the buildings at East Pittsburg, where it is to be used for moving freight cars and for general work.

This arrangement appears to be a complete solution of the problem of street car propulsion in all large cities and should give to your company a large amount of additional business.

A model of this system is now in operation at our office at No 120 Broadway, New York City, and will be exhibited to stockholders between the hours of 10 A. M. and 4 P. M. during July.

TESLA POWER DISTRIBUTING INVENTIONS.

Your company owns the exclusive right to manufacture and sell apparatus under the patents of Nikola Tesla, covering the use of multiphase alternating currents for power distribution. The rights under these patents are of great value, for developments indicate that it is only by means of Tesla's inventions that elevated and long lines of railways can be successfully operated, and that power can be most economically distributed over wide areas and throughout workshops. All of the machinery in your company's new factory at East Pittsburg is driven by Tesla multiphase motors, and in such a successful

---

Note.—The profitable character of the light and power business in large cities is indicated by the present prices of the common stock and bonds, which mostly are selling at a large premium.

manner that orders for like apparatus have followed its inspection.

The 5,000 H. P. generators contracted for by the Niagara Cataract Construction Company have been put in successful operation, and other important installations for power transmission under the Tesla patents have been made in various parts of the country.

Recently your company has fitted a short branch of the Pennsylvania Railroad with ordinary electrical apparatus for the propulsion of standard cars, and the tests have been highly satisfactory. Your company is, however, pushing forward the manufacture of multiphase motors under the Tesla patents for practical tests in running standard cars on elevated roads and long lines, the success of which will be of especial importance, for it will insure to your company a large amount of trade for which your rivals will have no right to compete.

Suits under the Tesla patents are pending against the Stanley Electric Manufacturing Company of Pittsfield, Mass., and the Thomson-Houston Company. In the latter case, on application made by attorneys of your company, the defendants have been limited to the 7th of October within which to close their testimony, it being the intention of counsel to push this and all cases of infringement to a hearing in order that your company may enjoy the exclusive privileges to which it is entitled.

While heretofore a very large percentage of the business of the country has been done by means of apparatus using continuous currents, it is now estimated by experts that the percentage will change so that in the near future the bulk of the business will be done by means of alternating current multiphase apparatus, involving the use of Tesla's important inventions.

CAPACITY OF NEW WORKS.

Our present room is sufficient for the employment of between four and five thousand men. The various buildings have been so arranged that the main workshop can be readily extended and the capacity of the works doubled at a comparatively small outlay without interference with regular manufacturing during building operations. Outside of the main buildings the others already have the required capacity and there is still available for further buildings fully one-half of the forty acres owned by the company.

The indications are that the demand for electrical apparatus in general will be greater during the next twelve months than for any like period in the past, and it is therefore a matter of great importance that our new works are now in complete operation. Very respectfully,

GEORGE WESTINGHOUSE, JR., President.

WESTINGHOUSE ELECTRIC AND MANUFACTURING COMPANY.

[The report here presented does not make as frank a showing as was to be hoped, and it is to be regretted that the directors did not take the stockholders into their confidence a little more fully, making a report more in detail, giving gross business done, with operating expenses so classified as to enable those outside of the company's service to know just what the management is. Considering that there was a loss of three months' business owing to moving to the new works, the item of net profit appears creditable. The item of accounts receivable, over $2,000,000, leads to the conclusion that the company has been a little too liberal in extending its credits. Yet long accounts are better than accepting stocks and bonds. Material in stock, etc., also looks too large, but is probably explained by an accumulation of orders during the moving operations. It is impossible for the stockholders to use their own judgment in estimating the value of stocks held by the company, carried at about $4,000,000, unless they are advised just what these stocks are. A list should have been given. Patents, etc., are still carried at about $4,400,000. This is far out of proportion to their actual value. Reminders of the unfortunate trade with the United States Company are not wanting, yet they must be carried. The proposed bond issue of $1,250,000 is not excessive.

With a clear field for the coming year, a well-equipped factory, and with careful management, the condition of the company should show a marked improvement by the time for the next report.—ED.]

An Oversight.

In our recent elevator articles, by an unaccountable oversight, the name of the Elektron Manufacturing Company of Springfield, Mass., was omitted from the list of independent concerns. The Elektron Company was one of the earliest in this field, is one of the old patrons of ELECTRICITY, and has made a good record for itself. It is now supplying motors to various prominent makers, in addition to its own complete electric elevator system.

An Electro-Metallurgical Plant for Scranton.

It is reported from Scranton that Dr. Carey T. Hutchinson, in behalf of a syndicate of Englishmen for whom he acts as consulting engineer, is about to establish in that city a plant for treating ores. One thousand horse power will be needed, and it is supposed that culm will be the fuel.

Helios Electric Company's Increased Facilities.

The Helios Electric Company, now at 1,310 Filbert street, Philadelphia, will remove their factory and offices on July 2 to 1,225-1,229 Callowhill street, where much larger quarters have been secured. ELECTRICITY congratulates Mr Marr and his company upon the success which has made this move necessary.

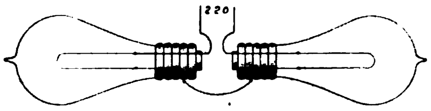
A Way to Connect Lamps for Use About Grounded Machinery.

BY WILL. D. LUTZ.

Having had occasion to use electric lights about machinery, and experiencing the inconvenience of receiving shocks, and occasionally making connection with the base of the lamp to the grounded machine with quite disastrous results, it occurred to me that such things might be avoided by properly connecting the lamps to the service wires. Of course I refer to the service as furnished by the Edison three-wire system as generally found in this country.

It is a well-known fact that the so-called neutral wire of the three-wire system is often purposely grounded, and consequently there is a difference of potential of 110 volts between either outside wire and the earth.

We will first take the two lamps in series as used by many wiremen, engineers, etc., as a portable light for use on the two outside wires. We connect our service wires to those binding screws in the sockets which lead to the centers of the lamp bases. We then connect the other two binding screws in the sockets which lead to the outside or exposed portion of the lamp bases together by a wire of a length to suit the circumstances. It is evident that this wire corresponds to the so-called neutral wire. Therefore we will have no difference of potential between this wire and the exposed parts of the lamp bases and the earth, provided similar lamps are used in each socket. The lamps can now be handled and used about grounded machinery without fear of a shock or short circuit. In the case of single lamps it is only necessary to ascertain which is the neutral wire, and connect that to the exposed part of the lamp base, connecting the other wire, as before, to the center of the lamp base.



These lamps may also be used in testing for a ground by connecting only one wire to one of the outside service wires and making connection with the base of the lamp to the object to be tested. If the object be grounded one lamp will burn. For general testing I find it far superior to a magneto, as one can form some idea of the resistance of the circuit tested.

[Our contributor is in error in one or two things. In the first place, while the neutral usually has a ground, as in fact is the case with all other circuits, it is not an intentional ground, such being forbidden by the Underwriters' rules. Second, the "two-lamp-in-series" method would not, unless the neutral wire were thoroughly grounded, answer the purpose intended, since if there were a better ground on either the positive or negative wires, contact with the socket would cause a flash on the negative or positive lamp. Third, no ground detector using a lamp as an indicator can be as reliable or sensitive as the magneto test, for unless the resistance of the ground plus that of the lamp is low enough to permit sufficient current to pass to illumine the filament, it will escape detection entirely, and if a ground is detected in the manner suggested it will still be a matter of conjecture whether it is on the neutral wire or on one of the outside wires. The resistance of the ground, too, would also be a matter of nearly the same uncertainty as when detected by the magneto.—ED.]

Personal.

Mr. George O. Fairbanks, of Chicago, an old-time Westinghouse man, was a New York visitor this week.

General News.

What is Going on in the Electrical World.

Chatsworth, Ill.—The electric light plant has been sold to F. C. Stanford.

Hyde Park, Vt.—The village trustees have purchased a water privilege for the purpose of running an electric plant.

Philadelphia.—The Market street cable cars have been withdrawn, and the trolley system is now in operation on that line.

Princeton, Minn.—An electric light plant is to be put in here; bonds have been issued for that purpose by a vote of the village.

East Orange, N. J.—John P. C n ling has asked the township committee for a franchise to string wires for an electric light service.

Oakland, Cal.—E. P. Vandercook has petitioned the board of supervisors for a franchise to construct and operate an electric road in this city.

St. Johns, Mich.—The village council called a special election for July 8 to vote on bonding the village to raise $35,000 for an electric light plant.

Cottage City, Mass.—The local street railway company headed by Josiah Quincy, Jr., of Boston, is securing rights of way for a belt electric line on the northeast end of Martha's Vineyard.

Wilmington, Del.—As soon as the right of way is determined, the directors of the new Wilmington and Chester Electric Railway Company will arrange for an active prosecution of the work.

Cincinnati.—A special election to take place July 17 has been ordered by the village council of Elmwood Place to vote upon the issue of bonds for the purpose of putting in an electric light plant.

Cape Girardeau, Mo.—The Cape Girardeau Street Railway has been sold at receiver's sale to J. A. Matteson, who represents a syndicate which intends to make an electric line of it and extend the mileage.

Little Falls, N. Y.—The Little Falls Electric Railway Company and the Herkimer and Little Falls Electric Railway Company have both been granted franchises to operate electric lines in the city.

Lynchburg, Va.—The Western Electric Company of Chicago has contracted with the Lynchburg and Rivermont Street Railway Company to put in an electric light plant for city lighting, to cost $48,000.

Vineland, N. J.—Charles Keighley & Son, owners of the city water works, have offered to supply the town with electric lights, and at the next meeting of the borough council, it is said, will apply for a charter.

Lansingburgh, N. Y.—At the special election of taxpayers on the 1st inst., to vote on an appropriation of $13,000 per year for five years to pay for 40 lights of 2,000 C. P., the measure was carried by a vote of 189 to 134.

Peoria, Ill.—Congressman J. Frank Aldrich, of Chicago, has been awarded two franchises by the city council of Peoria—one for electric and the other for gas lighting. He says he will begin the construction of his plants at once.

Bucyrus, O.—A New York capitalist has completed arrangements with the projectors to build the Inland electric road from Bucyrus via Sulphur Springs to Shelby at an estimated cost of $350,000, work to commence immediately.

Langdon.—There is talk of organizing a company to build and operate a line of cars from Langdon to connect with the Columbia cable at 12th street, Washington. Dr. L. C. Loomis is the prime mover in the proposed enterprise.

Southbridge, Mass.—At a meeting of local capitalists on the 2d inst. $25,000 was pledged toward the building of an electric railroad from Sandersdale to Fiskdale. It is expected that a portion of the route will be open in two months.

Tamaqua, Pa.—The Inter-County Electric Railway Company's trackage and partly finished plant have been sold at sheriff's sale to the Lehigh Coal and Navigation Company. The road will now be known as the Lansford and Tamaqua Electric Railway.

Jamaica, N. Y.—Col. A. A. Degrauw, one of the wealthiest men of Jamaica and a large stockholder in the Jamaica and Hempstead plank road, is negotiating with an electric railway company to build a trolley line over this route from Jamaica to Hempstead.

Montreal, Can.—At the annual meeting of the Canadian Electric Light Company, the old board of directors were re-elected. The directors elected R. McLennan president, Adolphe Davis vice-president, and F. S. McLennan secretary-treasurer.

Goliad, Texas.—The firm of Greathouse, Taylor & Burr, of Beeville, have been given the contract for constructing the necessary buildings and putting in the plant for waterworks and electric lights for this city. The whole work is to be completed in six months from July 1.

Milwaukee, Wis.—The incorporation papers of the South Milwaukee and Cudahy Street Car Company have been signed and are ready for filing. The company is capitalized at about $100,000. M. C. Ring, C. E. Estabrook, W. M. Williams, Theobald Otjen and W. S. Stanley are the incorporators.

Norfolk, Va.—The Portsmouth Street Railway Company has been granted right of way for its proposed electric railway in specified streets and roads of the county.—A company is considering the plan of building an electric road from Berkeley along the eastern branch of the Elizabeth River by way of Kempsville.

Brooklyn, N. Y.—H. M. Littell, who lately resigned the presidency and general management of the New Orleans City and Lake and Crescent City Railroads, has been elected president and general manager of the Atlantic Avenue and Brooklyn Bath and West End Railroads, the properties of the Brooklyn Traction Company.

Pittsburg, Pa.—Legal notice of the application for a charter of the Consolidated Traction Company has been filed by George I. Whitney, G. W. Elkins, C. L. Magee, Wm. Flinn and Geo. Sheppard. The application will be made at Harrisburg on July 22. This the *Dispatch* construes to mean the general consolidation of the Duquesne, Central and Pittsburg traction lines and all their branches.

Alton, Ill.—Application has been made for letters of incorporation for the Alton Railway and Illuminating Company. The new company will absorb the Alton Electric Street Railroad Company, the Alton Improvement Association and the Alton and Upper Alton Horse Railroad and Carrying Company. The new company will be incorporated with a capital stock of $250,000. The incorporators are J. F. Porter, C. W. Milnor and H. R. Phinney.

Atlanta, Ga.—The Atlanta Traction Company is changed under the reorganization to the Atlanta Railway Company, and the ownership and management are in new hands. The incorporators named in the new charter are: W. C. Shaw, R. D. Fisher, Henry Helken, W. S. Thomson, Alex. C. King, Luther Z. Rosser, M. F. Amorous, F. I. Stone and G. W. Parrott. Mr. Parrott has been elected president and Mr. Amorous vice-president. The capital stock has been placed at $300,000 and many improvements will be made in the system.

Niagara Falls.—The first practical test of power transmission from the plant of the Niagara Falls Power Company was a great success. The monster dynamo, transformers, converters, and all the machinery and apparatus worked as smoothly and easily as if it was but a 1 H. P. plant that was in operation instead of one of 5,000 H. P. The power was transmitted one mile over wires to the Pittsburg Reduction Company's works, where the machinery connected was almost instantaneously set in motion by the current transmitted from the power works.

Harrisburg, Pa.—Governor Hastings has vetoed the electric light bills which were rushed through the Legislature in the closing week of the session. One of the bills extended to cities the privilege enjoyed by boroughs, of manufacturing electricity for municipal purposes, but made compulsory the purchase of any existing private company's plant before a municipal plant could be established; the other bill was intended to give electric light, heat and power companies a monopoly by preventing new companies from going into territory already occupied.

Wheeling, W. Va.—Wheeling parties will soon put in operation at Sisterville an electrical device for pumping oil. It is proposed to put an electric motor at each well and furnish power from a central electrical plant, a single wire being sufficient to take the place of the fuel and costly water line. With the application of electricity twenty wells may be strung on one wire and all furnished with power from it. It is the intention to get a plant in operation at Sisterville by the first of October which will operate 200 wells for a starter.

Buffalo, N. Y.—The electrical supply dealers and contractors of Buffalo have formed an association. Their preamble says: "Whereas, in consideration of furthering the interests of the electrical supply dealers and contractors, and the want of a closer business and social relation, therefore we, master electricians of the city of Buffalo, do form an organization for our mutual benefit and protection." The preamble is signed by F. P. Jones & Co., Jaynes Electrical Company, the F. P. Little Electrical C. and S. Company, W. A. Fenn and the Buffalo Electrical Company.

Hoboken, N. J.—The elevators at the West Shore ferry, Weehawken, and the steam road over the iron viaduct to Fort Lee have ceased operations, the new trolley line to the ferry having opened for traffic. Motors leaving the ferry go direct to Hudson Heights.—James H. Symes, of the township of Union, contemplates operating an independent trolley road through North Bergen and Union Hill to connect with the Rutherford road at Homestead and the North Hudson County Railway Company at Main street and Bergenline avenue, Union Hill, and if he gets the necessary right of way he will push the project with vigor.

Baltimore.—Tests have been made of the big electric locomotive in the Belt tunnel, and its operation in the several trials was witnessed by a number of railroad officials and electrical engineers, who expressed themselves as satisfied that the machine was fully capable of performing the work for which it was intended. A speed of twenty miles an hour was attained in the trials.—The Canton, Sparrows and North Point Railroad Company is considering whether or not to build its own power house. If built, an equipment of at least 1,000 horse power will be needed for dynamos. F. Wood is one of the directors of the company.

New York.—The Mayor's veto of the franchise granted by the board of aldermen to the Third Avenue Company for an electric road along Washington Heights to Kingsbridge has brought that company (which in the franchise voted it got the right for nothing) to make an offer for the franchise of $250,000, with a percentage of not less than 2 per cent. of the gross receipts above the statutory requirement. The Metropolitan Traction Company has offered for the franchise not less than 2 per cent. of the gross receipts in addition to the 3 and 5 per cent. imposed by statute, and a cash bonus of $100,000. Both applications have been filed and a hearing has been set for August 7.

Washington, D. C.—Mr. Benedict, the public printer, intends to thoroughly light the new Government Printing Office by electricity, and will also have much of the machinery operated by the same power. Small motors will be applied to the various machines, in order that they may be operated independently. A contract has been made with the Westinghouse Electric and Manufacturing Company for an engine and three generators. Another contract has been made with the Crocker-Wheeler Company of New York for one of the largest switchboards in the country. Contracts will be let soon for electric wiring, and in this connection 70,000 feet of wire and 10,000 yards of flexible cord will be purchased.

Chicago.—The contract for equipping the Lake street elevated railroad has been awarded to the General Electric Company.—The *Inter-Ocean* states that the Chicago and Northern Pacific Railway Company has decided to change the motive power of its three suburban lines—Thatcher's Park, Harlem and Chicago Central—from steam to electricity. The overhead trolley system will be used and about thirty-five miles of track will be affected. If the electrical experiment on the Chicago and Northern Pacific proves a success the new motive power will undoubtedly be adopted by the St. Paul on its Evanston branch and by the Illinois Central on its entire suburban system.—The council committee on streets and alleys have recommended for passage an ordinance permitting the running of trolley cars on Clark street.

THE TELEPHONE WORLD.

The wires of the People's Telephone Company at Leavenworth, Kan., are up, the switchboards are being put in place at the central office and other interior work is being pushed.

The application of the International Telephone Company for permission to string wires and erect poles within the limits of the city of Cape May, N. J., has been referred to the committee on streets.

Thomas Ryan, Charles M W rner, John Dunfee, Frank Hiscock and others have applied to the common council of Syracuse, N. Y., for a franchise.

The common council of Corning, N. Y., has granted a franchise to the American Telephone and Telegraph Company to erect lines through that city.

The Wisconsin Telephone Company has been granted a franchise by the council of Menasha, Wis.

The canvassers for the projected new telephone exchange at Bridgeport, Conn., are meeting with success. It is believed that the company will acquire the charter rights of the Connecticut Telegraph and Telephone Company.

The Astoria Telephone Company of Astoria, Ill., has been incorporated by A. J. Baxter, J. H. Windi erst, J. M. Todd, T. W. Emerson and H. F. Farwell. The capital stock is $2,500.

The Interior Department at Washington is now successfully operating its own telephone system. Every head of bureau or division has upon his desk a movable apparatus consisting of receiver and transmitter, and it is but an instant's work to call up the central office, located in the building and run by one operator, and get connection with any other official. The work was done by the Western Telephone Construction Company.

The Baxter Overland Telephone Company, Utica, N. Y., has resolved to raise $ 5,000 on mortgage to provide means to pay off its debts and put the line in first class condition. The company will renew its [illegible]00 miles of wire, and it has 300 telephones which can be put to use in a few days.

The Buffalo *News* says: "Many complaints are made nowadays of the service given by the Bell Telephone Company in this city. It was thought that dividing the system into four districts would better the service, but it seems to get worse instead. It is no uncommon thing to call from three to half a dozen times for central, and then to have to call up '95' to get proper attention. The discipline of the service seems to need bracing up very badly."

The Little Rock (Ark.) Telephone Company has filed a certificate of an amendment to its articles of agreement and incorporation increasing the amount of capital stock to $100,000, which amount may be increased by a majority vote of the stockholders of the company at any general meeting to any sum not exceeding $50[illegible],000. The board of public affairs of Little Rock has reported favorably an ordinance granting the company a franchise.

The entire plant of the Citizens' Mutual Telephone Company, worth $25,000, together with the franchise, was sold at Decatur, Ill., recently, to John A. Brown of that city as trustee for a syndicate. The bill of sale was made by the Rev. Charles G. Wood, who has held a chattel mortgage on the property for over a year. The company has about 600 Harrison telephones in use.

The Washington *Post* is opposed to the establishment of a new telephone company in the city of Washington, and a recent article in that paper, inspired doubtless by the present monopoly, prompted the *Times* to say: "It has been just such influence and arguments that have kept the Washington public in the hands of corporations. Heretofore whenever competition has endeavored to enter the field this contemporary has denounced the effort as chimerical, impracticable, and Congress and the public generally has been made to believe that the corporations then supplying the service were nearly bankrupt, and that it would be an act of injustice to compel them to submit to competition or make a reduction in prices. It is cheaper telephone service that is desired, and whether the *Post* and its client like it or not, citizens have a right to control for that service." There are two telephone companies after franchises in Washington—the Standard and the Home.

Both the Harrison and Brown telephone franchises have, after reconsideration, been referred back by the Detroit city council to the committee on streets and ordinances.

The Phœnix Telephone Company of Indianapolis is trying to get 1,000 subscribers in Des Moines, so that an exchange can be opened there by November. It is said that between 20 and 300 signers have already been secured and that the prospects are good for the company's securing 1,000. Its rates are 24 a year for residences and $36 for business houses. The old company will meet the competition by lowering its rates.

The Pittsburg *Leader* says: "In Johnstown, Pa., an independent exchange, recently organized, has ordered 100 new instruments from one of the independent manufacturers, and is putting them in use. Some time ago the Bell people asserted that a $[illegible]0 rate a year did not pay 6 per cent. interest on investment. The new company made a rate of $24 for residence telephones and $30 for business houses, and a good and satisfactory profit is said to be earned from these rates. The old Bell subscribers have nearly all gone to the new company."

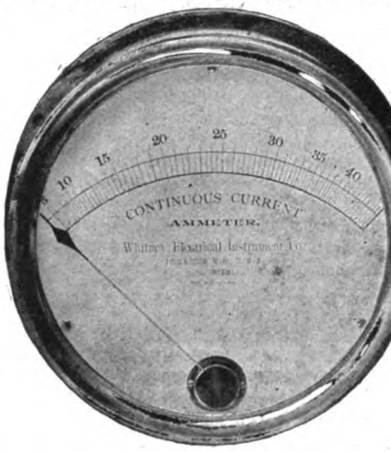
C. E. Severance, president of the California Telephone Company, when in San Jose recently said that the work of the company at Sacramento was progressing rapidly, and the company would be equipped for business about July 15 after which the men in charge of the construction there would commence work at San Jose providing the company obtains the franchises applied for. The company will then connect with the Alameda, Santa Cruz and Sacramento companies. The Santa Cruz company will be ready for business as soon as the telephones arrive from the East.

A prominent member of the San Francisco Chamber of Commerce says he is convinced that the Pacific cable which has been talked about for years and discussed ad interim in Congress, is to be built by British capitalists. To the statement that Englishmen and Australians, with Canadians, have decided to undertake the work, he adds the further assertion that the difficulty of obtaining a midocean station has been overcome. The United States decided last winter not to sanction the establishment of such a station on one of the Hawaiian Islands to be controlled solely by Britishers. To avoid international complications, Fanning Island, in Lat. 3 North, has been decided upon as a station. The cable is to be laid from Auckland, New Zealand, to Norfolk Island, in the Southern Pacific, a distance of 415 miles. The second section of the cable will be from Norfolk Island to Fiji, a distance of 1,002 miles; the third to Fanning Island, 1,715 miles, and the fourth and largest section from Fanning Island to Vancouver, a distance of 3,242 miles. The total length of the cable will thus be 6,374 miles. The estimated cost of the cable from Auckland to Vancouver is, in round figures, $7,585,000.

The independent telephone company (Electric Messenger Co.) lately formed at Pittsburg, Pa., to compete with the Bell company includes some of the most prominent business men of the city. J. N. Pew, president of the People's Natural Gas Company, has been elected president; Joseph T. Colvin, formerly president of the National Bank of Commerce, secretary; Theodore Johnson, treasurer. Other stockholders are Representative William T. Marshall, Samuel G. Pew, Thomas Bigelow, R. S. Duffield, superintendent of the People's Natural Gas Company, and E. O. Emerson, of Titusville. It is the purpose of the company to erect exchanges in and run its lines through the counties of Adams, Allegheny, Armstrong, Beaver, Bedford, Bucks, Butler, Cambria, Crawford, Chester, Cumberland, Center, Clearfield, Clarion, Delaware, Dauphin, Erie, Fayette, Franklin, Greene, Huntington, Indiana, Juniata, Lancaster, Lebanon, Montgomery, Mifflin, Mercer, Philadelphia, Perry, Schuylkill, Venango, Washington, Westmoreland and York. An ordinance has already passed the Pittsburg city councils granting the right to lay lines, and a similar ordinance is now pending in Allegheny councils for right of way on the north side.

The New Whitney Switchboard Instrument.

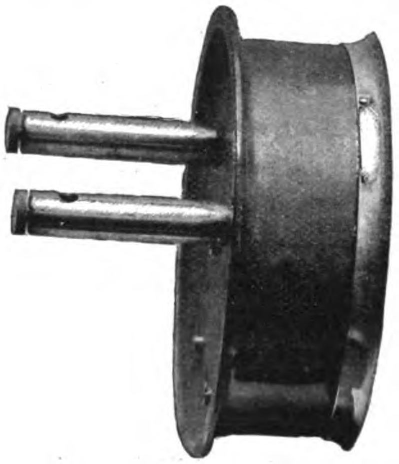
The Whitney Electrical Instrument Company of Penacook, N. H., have just begun putting on the market a new Switchboard Instrument for direct current reading, which is illustrated in the accompanying cuts. The features which specially commend this instrument to the central station man are—



First—Their extreme accuracy, being guaranteed within 1 per cent of absolute accuracy.

Second—The large scale, nearly seven inches in length, permitting the divisions to be large and clear and hence easily legible at a distance.

Third—Their handsome mounting in black enameled iron cases with nickel front.



The instruments are dead-beat, thoroughly dust proof, and not affected by outside influences They are intended to remain constantly in circuit, and when thus used will not show a heating error.

BUSINESS HINTS.

Public Buildings, Theaters, Residences, &c., Proposed or in Course of Construction.

[The following summary is prepared weekly for ELECTRICITY for the information of advertisers and readers who are dealers in apparatus and articles required in the electrical equipment of public and private buildings.]

Bangor, Me.—George E. Macomber, J. P. Hill and others are talking of erecting a building for public meetings, conventions, etc.

Buffalo, N. Y.—Plans have been prepared for a six story flat building, to be erected near the Circle and North street....Samuel E Laird will erect a six story apartment house at northwest cor. Main and Utica sts.; Architects Strong & Wilby.

Hicksville, Ohio.—Plans have been prepared for the erection of an opera house; electric lights, etc. Mr. Huber owner

Jacksonville, Fla.—Fred F. Wilton & Co. of Boston propose building a theatre in La Villa.

New York City —R Townsend, 1,[illegible]96 Broadway, is making plans for a sixteen story office building to be erected on Cedar st....Samuel Hirsch has plans for two six story office buildings, 9 University Place and 38 Clinton Place ..Wm. Broadbelt, the builder, is having plans made for a seven story mercantile building to be erected at 2 1 West 23d st.; elevators, electric light and power appliances, etc.; Architect F. B. Dinkelberg, 3 Union Square....It is reported that the Washington Life Insurance Co. will erect an office building cor Broadway and Cortlandt st. ....Alexander Moore, 151 West 61st st., will erect a seven story brick apartment house, cor. of 6[illegible]th st. and Centra

Park West, to cost $125,000....Boehm & Coon, the builders, who now have in course of construction at Washington Square and Washington Place a seven story fire proof store and loft building, are making preparations to build a similar structure on the plot adjoining the Washington Place front. The new structure will contain modern equipments, including elevators, electric wiring and apparatus....John Kehoe, the builder, will erect a seven story store and loft building on northeast cor. of Broome and Wooster sts....A modern fire-proof apartment hotel, ten or twelve story, is to be built in 14th st. by Walker & Lawson; Architect M. B. V. Ferndon, 176 Broadway; passenger and freight elevators, electric wiring, etc....St. Nicholas Skating Club expects next winter to build a $5 0,00 skating rink, near the Boulevard and 6 th st., the building to include a restaurant: among those interested are Cornelius Vanderbilt, Mrs. Stanford White, Mr. and Mrs. John Jacob Astor and others ...Mrs. Ida Wolf will build a 6 story brick store and warerooms at 74 Hester st....R. H. Macy & Co. will build a nine story store and roof garden at 57- 1 West 13th st.; Architect Wm. Schickel, 111 Fifth ave. ....A mercantile building will be erected at 45-47 Crosby st. on a plot recently purchased by Edward Judson, the builder; the structure will be heated by steam and lighted by electricity; elevators, etc.; Architect C. A. Anderson.

Philadelphia, Pa.—John Stafford will erect a handsome four story residence for himself at cor. of Broad and Norris sts....Estimates have been invited by Architect Smedley for work on the stores and apartments to be built by J. W. Halahan, 1682 Chestnut st.; the structure will be six stories....The American Baptist Publication Society is preparing to build a six story building on the site of the old Siloam Methodist Episcopal Church at Juniper and Lombard sts....The Kensington Labor Lyceum intends to erect a handsome building at 2d and Cambria sts. for hall and meeting-rooms and conservatory of music....The plans for the new Philadelphia Museum, on the University grounds, have been approved by the board....The eight story building to be erected by Hamilton Diesinger on the south side of Chestnut st., and above 12th, and for which Architect Frank P. Watson is preparing plans, is to contain an individual electric light plant.

St. Louis.—The Oriental Theater Company will erect a theater building, north side of Pine, between 16th and 17th sts.; electric lighting, electric bells, and all modern appliances; Architects Kirchner & Kirchner, 520 Olive st.

Washington, D. C.—Sealed proposals, in duplicate, will be received at the Department of the Interior until 2 o'clock on the 22d inst., for the furnishing and installation of an electric light plant at the Government Hospital for the Insane, near Washington, D. C., in accordance with specifications to be had on application to the Department.

Ypsilanti, Mich.—The Ypsilanti Opera House Company will erect an opera house; electric lighting etc. Architects Malcomson & Higginbotham, Moffatt Block, Detroit, Mich.

INCORPORATIONS.

The Electric Boat Company of New York, New York City—to deal in and manufacture electric propellers for boats, and electrical appliances generally. Capital stock, $8,000. Promoters: F. S. Allen, B. T. McDowell, C. H. DeWitt, New York City.

The Syracuse and Suburban Railroad Company, Syracuse, N. Y.—to build and operate an electric street surface road in Onondaga County. Capital stock, $ 50,000. Promoters: W. B. Cogswell, O. V. Tracy, G. E. Higgins, Syracuse.

The Chaplin Company, Kittery, Maine—to purchase, manufacture and sell electrical, mechanical and chemical inventions. Capital stock, $75,000. Promoters: Edwin D. Chaplin, Cambridge, Mass.; Hiram L. White, Somerville.; Henry C. Halloran, Boston, Mass.

The Wilde Tidal Power Company, Kittery, Maine—to manufacture and deal in machinery for developing electricity by means of tidal water. Capital stock, $500,000. Promoters; John Wilde, Lorin M. Cook, Alfred Caldwell, Providence, R. I.

The Consolidated Electric Purifier Company, Chicago, Ill.—to own, control and deal in and operate under letters patent, particularly such as relate to improvements in machinery, steam boilers and engines, the fittings and attachments therefor. Capital stock, $1,500,000. Promoters: A. Miller Befield, Wm. C. Ancher, Jno. W. Hill.

The Arkansas City and Northwestern Construction Company, Jersey City, N. J.—to build, construct, maintain and operate railroad and steamboat lines; to construct, develop and promote electric railways. Capital stock, $ 00,000. Promoters: Marion W. Lewis, Boston, Mass.; John B. Leake, New York City; Geo. L. Dayton, Jersey City.

The Penn Insulated Wire Company, Camden, N. J.—to manufacture all kinds of insulated wire, cables, paper, tapes and insulating compounds for electrical purposes. Capital stock, $150,000. Promoters: Franklin S. Randall, W. Howard Holden, Howard A. Engle, Philadelphia.

The Inter-Ocean Electric Railway Company, Chicago, Ill.—to construct, equip, own and operate electric railways, both surface and elevated, and electric telegraph, telephone and signal lines; acquire inventions and letters patent for improvement in railways, cars, motors, brakes, trolleys, etc.; construct and operate electric light plants. Capital stock, $200,000,000. Promoters: James G. Hulse, Parker Crittenden, John W. Hill.

The Gas Consumers' Association of the United States, San Francisco, Cal.—to deal in the regulation of illuminating gas and electric light, make and sell fixtures, appliances and inventions pertaining to the regulation of illuminating gas and electric light. Capital stock, $300,000. Promoters: J. D. Whitney, J. R. Spring Sampson Tanes, Isaac Hecht, Henry Kerber, Jr., San Francisco; D. L. Randolph, Alameda; Carter P. Pomeroy, San Rafael, Cal.

The Consumers' Light and Power Company, Spokane, Wash.—to operate machinery for electrical and other power for lighting, heating, etc. Capital stock, $2 0,000. Promoters: S. Oppenheimer, W. R. Newport, A. D. Hopper, J. W. Binkley, M. J. Waller, H. A. Van Kempen, E. J. Dyer.

The Phœnix Electric Company, Butte, Mont.—to engage in a general electric business. Capital stock, $100,000. Incorporators: John F. Cowan, James A. Talbot, H. L. Frank, A. Whel and C. H. Smith.

The Albany and Suburban Railway Company, Albany, N. Y.—to construct an electric road about twelve miles in length for passengers, express and freight, to connect Greenbush, Castleton and Bath-on-the-Hudson with Albany. Capital stock, $200,000. Directors: F. H. Barnes, John S. Burke, George T. Cunningham, of Ballston; George D. Moore, of Worcester, Mass.; Arthur Hilton, of Boston; John Leggett, Joseph A. Leggett and Albert J. Barnes, of Troy, and Charles A. Goddard, of Lowell, Mass.

The Wilmette Electric Light and Power Company, Wilmette, Ill.—to manufacture electricity. Capital stock, $15,000. Incorporators: John S. Meyer, John W Meyer and Edwin Webb.

The Consolidated Electric Purifier Company, Chicago—to operate purifiers. Capital stock, $1,500,000. Incorporators: A. M. Belfield, William C. Archer and John W. Hill.

At a recent meeting of stockholders of the Ellicott City Electric Light and Power Company, at Ellicott City, Md., a resolution was adopted to incorporate a new company, to be known as the Electric Light Company of Howard County. The capital stock named is $5,000.

The Electric Wire Hanging Insulator Company, Chicago, Ill.—to manufacture electrical apparatus. Capital stock, $100,000. Incorporators: Edgar O. Baker, M. A. Robertson, Henry W. Rice.

The South Freeport and Cedarville Electric Railway Company, Freeport, Ill.—to build and operate an electric railway between Freeport and Cedarville. Capital stock, $10 ,000. Incorporators: A. Bergman, Henry Lichtenberger and A. Baumgardtner.

The Alton Railway and Illuminating Company, Alton, Ill.—to operate a street railway, power and heat. Capital stock, $250,000. Incorporators: Joseph F. Porter, Charles W. Milnor and Henry R. Phinney.

The American Telephone Directory Company, Chicago—to publish a directory. Capital stock, $10,000. Incorporators: John R. Collins, Joseph A. Peters and Albert L King.

The American Electric Fuse Company, Chicago—to manufacture electric fuses. Capital stock, $25,000. Incorporators: Eugene Hildebrand, Clarence E. Brown and Ralph W. Bowman.

Articles have been filed at Springfield, Ill., for the incorporation of the Transcontinental Railway Company. The principal office of the company is to be maintained in Chicago, and the capital stock is placed at $200,00 ,000. It is proposed to construct and operate a railroad from Chicago to Jersey City, N. J., with all necessary switches, branches, depots, turntables, houses, etc. The incorporators and first board of directors are: Lysander Hill, Charles C. Bilkley, M. E. Beasley, L. A. Gardiner and John W. Hill, all of Chicago.

The Union Electric Company, of Charleroi, Pa. Capital, $1,000. Incorporators: John A. Irwin and James S. Carr, Allegheny; Harry W. Gleffer, Haysville, and Henry S. Stewart and James S. McKean, Pittsburg.

The Greenwich and Schuylerville Electric Railroad Company, Greenwich, N. Y.—to build and operate an electric railroad between the places named in the title. Capital stock, $ 00 000. Directors: Thomas W. Cantwell and William J. Wilson, of Albany; Watson N. Sprague and Robert Hamilton, of Greenwich; Martin Schenck and Reeves Smith, of Troy; James Mealey and James E. Kelly, of Schuylerville and Albert M. Crandall, of Middle Falls.

The Citizens' Electric Company of Mishawaka, St. Joseph, Ind. Capital stock, $10,000.

The Welsbach Commercial Company, New York City—to manufacture and deal in all kinds of devices for the production of light, heat and power. Capital stock, $7,000,000, of which $3, 00,000 is preferred. Directors: S. H. G. Steward, E. McMillan, Jr., W. F. Boudouthrift, J. H. Scoville, E. Francis Eldridge, A. L. Page, J. O. Havemeyer, R. M. Murray, Charles J. Lithgow, E. J. Cratz, Edson Purcell, J. L. Nesbit and A. M. Poole.

The Fairmont Railway Company, Fairmont, W. Va.—to operate a street railway in Fairmont. Capital stock, $200,000. Incorporators: M. A. Clayton, W. T. Norton, C. L. Skinner and others.

MOONLIGHT SCHEDULE FOR THE UNITED STATES.

(Issued by the Washington Carbon Company.)

JULY, 1895.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JULY 2, 1895.

ELECTRIC RAILWAYS AND APPLIANCES.

541,9 9. Trolley-Wire Clip. Fred W. Haeusgen, Buffalo, N. Y. Filed Oct. 9, 1894.

542,002. Trolley-Restoring Attachment. William D. McDaniel, Philadelphia, Pa., assignor of one-half to Luther S. Green, same place. Filed Oct. 29, 1894.

542,036 Electric Locomotive. Thomas E. Adams, Cleveland, Ohio. Filed Oct. 3, 1894.

542,105. Conduit Electric Railway. Leonidas C. Pressley, San Francisco, Cal. Filed Feb. 13, 1895.

542,164. Conduit Electric Railway. Louis R. Lavalle and Albert H. Lavalle, Holyoke, Mass. Filed March 17, 1894.

ELECTRIC LIGHTS AND APPLIANCES.

541,929. Incandescent Electric Lamp. Robert Greer, Westbrook, Me. Filed Nov. 10, 18 4.

542,210. Safety Device for Handling Electric-Arc Lamps. Edward P. Snowden, St. Joseph, Mo. Filed March 22, 189 .

DYNAMO ELECTRIC MACHINERY.

541,854. Dynamo-Electric Machine. Thomas H. Hicks, Detroit, Mich. Filed Aug. 2 , 1894.

541,919. Commutator-Brush. Hermon B. Collins, Fulton, N. Y. Filed Jan. 26, 1895.

TELEPHONE AND TELEGRAPH APPARATUS.

541,967. Automatic Telegraphy. Patrick B. Delany, South Orange, N. J. Filed April 3, 1895.

541,994. Duplex and Diplex Telegraphy. Minor M. Davis, Brooklyn, N. Y. Filed April 18. 1895.

5 2,0 2. Telephone System. Angus S. Hibbard, Chicago, Ill. Filed Feb. 21, 1895.

512,066. Annunciator-Circuit for Telephone-Switch-Boards. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Nov. 12, 1894.

512, 91. Magneto-Electric Telephony. Edward S. Halsey, South Evanston, assignor of one-half to William J. Phelps, Chicago, Ill. Filed April 20, 1894.

BATTERIES.

542,049. Galvanic Battery. Ralph W. Gordon, Boston, Mass. Filed Jan. 31, 189 .

MISCELLANEOUS.

541,921. Manufacture of Electrical Conductors. Louis W. Downes, Providence, R. I. Filed April 2, 1895.

541,923. Phonograph. Thomas A. Edison, Llewellen Park, N. J. Filed Nov. 21, 18 0.

541,924. Phonograph. Thomas A. Edison, Llewellyn Park, N. J. Filed Dec. 3, 1890.

541,9 8. Electric-Wire Joint. Alfred Gartner, Newark, N. J., assignor to Charles H. McIntire, same place. Filed May 2 , 1895.

512,030. Automatic Safety Device for Electric Circuits. Lewis G. Rowland, Camden, N. J., assignor to the Universal Fire Alarm Company, same place. Filed Feb. 6, 1895.

542,057. Electrolytic Process and Apparatus. Leon P. Hulin, Modane, France. Filed Dec. 19, 1894.

541,94 . Block-Signal for Railways. William G. Roome, Jersey City, N. J. Filed April 28, 1892.

542,108. Train-Annunciator. Charles H. Rittenhouse, Kendallville, Ind. Filed Feb. 14, 1 95.

54 ,109. Coin-Operated Toll Collector and Annunciator. William A. Rogers, Omaha, Neb. Filed March 7, 1895.

DESIGN.

21,459. Electric-Heater Case. James F. McElroy, Albany, N. Y., assignor to the Consolidated Car-Heating Company, same place. Filed March 7, 1895. Term of patent 14 years.

ELECTRICITY.

THE POPULAR ELECTRICAL JOURNAL.

ILLUSTRATED

PUBLISHED WEEKLY BY THE

Electricity Newspaper Co.,

No. 6 PARK PLACE,

NEW YORK.

VOLUME IX.

Nos. 1 to 26 inclusive.

JULY 17, 1895--JANUARY 8, 1896.

INDEX TO ELECTRICITY.

VOL. IX.---NOS. I TO 26 INCLUSIVE.

"Buckeye" Lamps.

An International Lamp Test.

In a competition between all the leading Incandescent Lamps of Europe and America, held at Hamilton, Ontario, under the direction of Mr. Charles F. Stilwell, (who began the study of incandescent lighting at Menlo Park fifteen years ago,) the

IMPERIAL LAMP

stood first in sustained brilliancy and duration of life, combined with economy of operation.

This series of tests was the most extensive ever undertaken by a disinterested investigator, was obtained with our regular product and made without our knowledge. Its value, as compared with "tests" in the factories of rival makers can be appreciated.

The result of the competition was the recommendation of the Imperial Lamp to their customers by Messrs. Stilwell, Ralston & Co., of Hamilton, Ontario, who will in the future use nothing else, although offered cheaper lamps by many makers.

WESTINGHOUSE ELECTRIC & MANUFACTURING CO.,

SOLE OWNERS OF THE

TESLA POLYPHASE SYSTEM,

The ideal system for the distribution of power and light in factories and mills.
Motors, arc lights and incandescent lights supplied from the same circuits.
The system adopted by the Cataract Construction Company for their great plant at Niagara.

Adapted for transmission of power over long distances, also for local distribution of power.

Brushes and moving contacts may be dispensed with, rendering the system peculiarly useful in mining operations.
All machinery in our new works at East Pittsburg driven by Tesla Polyphase Motors supplied from a central power plant.
Results: High Efficiency, Convenience, Economy of Installation and Operation, and Flexibility

INSPECTION INVITED.

Two suits are now pending against the Thomson-Houston Company under the Tesla Patents Upon motion of the Westinghouse Company in the Circuit Court at New Haven recently, the Thomson-Houston Company were limited to October 7th to take their testimony in defence. The suits will therefore be ready for argument in the near future.

The novelty of Mr. Tesla's invention was recognized by PROF. ELIHU THOMSON, who said, in discussing the Tesla inventions before the American Institute of Electrical Engineers in 1888:

"I have certainly been very much interested in the description given by Mr. Tesla of his *new and admirable* little "motor. I have, as probably you may be aware, worked in somewhat similar directions and towards the attainment of "similar ends. The trials which I have made have been by the use of a *single* alternating current circuit, not a *double* "alternating circuit."

Long-Distance Dust Transmitter.

Patented in England and America.

The Original Powder Transmitter and the only one adopted by the English Post Office for public long-distance service all over Great Britain. You can shout in it or whisper in it and get perfect articulation in either case. No limit to the distance they will work.

Claim No. 1 of the "Hunnings" Patent "is in a tension-regulator or means for varying the resistance in a telephone transmitter, finely divided conducting material in a loose and free state."

THE "HUNNINGS"
DUST TRANSMITTER

Does not depend upon variable pressure between electrodes in constant contact. Incorporated as **a portion of the Electric Circuit** is a quantity of finely divided conducting material or dust, the movement of which varies the current.

We are the only Manufacturers in the United States of the Celebrated "Hunnings" English Transmitter.

Several large exchanges are now using our "Hunnings" Outfit.

THE "CLARK" WIRE.

In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: . . . . . .

" A Thoroughly Reliable and Desirable Wire in Every Respect."

For Switchboard, Railway and Motor Use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing because it always gives perfect satisfaction.

The Rubber used in insulating our Wires and Cables is especially chemically prepared and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.
